pigment. Any substance, usually in the form of a dry powder, that imparts color to another substance or mixture. Most pigments are insoluble in organic solvents and water; exceptions are the natural organic pigments, such as chlorophyll, (q.v.) which are generally organosoluble. To qualify as a pigment, a material must have positive colorant value. This definition excludes whitening, barytes, clays, and talc (see fillers, extenders). Some pigments (zinc oxide, carbon black) are also reinforcing agents, but the two terms are not synonymous; in the parlance of the paint and rubber industries these distinctions are not always observed.

Pigments may be classified as follows:

I. Inorganic

- (a) metallic oxides (iron, titanium, zinc, cobalt chromium).
- (b) metal powder suspensions (gold, aluminum).
- (c) earth colors (siennas, ochers, umbers).
- (d) lead chromates

II. Organic

- (a) animal (rhodopsin, melanin).
- (b) vegetable (chlorophyll, xanthophyll, litmus, flavone, carotene). See also pigment, plant.
- (c) mineral (carbon black).
- (d) synthetic (phthalocyanine, lithols, toluidine, para red, toners, lakes, etc.).

See also dye, natural and synthetic.

"Pigmentar."²⁹⁶ Trademark for tar products derived from the distillation and decomposition of oleoresinous southern pine. Produced to various viscosity grades. Used in rubber compounding and reclaiming, marine paints and roof coatings.

Pigment Blue 15 $C_{32}H_{16}N_8Cu$. A bright blue copper phthalocyanine pigment (q.v.). C.I. No. 74160.

Preparation: By heating phthalonitrile with cuprous chloride.

Uses: In paints; alkyd resin enamels; printing inks; lacquers; rubber; resins; papers; tinplate printing; colored chalks and pencils.

Pigment Blue 19 $C_{32}H_{28}N_3O_4SNa$. A bright blue to bright reddish navy triphenylmethane pigment (q.v.). C.I. No. 42750A.

Use: Coloring for candles.

Pigment Blue 24 $C_{37}H_{34}N_2O_9S_3Na_2$. A bright greenish blue triarylmethane pigment (q.v.). C.I. No. 42090.

Uses: In printing inks, especially for tinplate printing; in rubber; plastics; artist colors; lacquers.

pigment E. See barium potassium chromate pigment.

Pigment Green 7 $C_{32}O_{10-11}N_8Cl_{15-16}Cu$. A bright green chlorinated copper phthalocyanine pigment (q.v.). C.I. No. 74260.

Derivation: Heating copper phthalocyanine in sulfur dichloride under pressure.

Uses: Paints; printing inks; lacquers; leather and book cloth; paper surfacing; chalks; colored pencils.

pigment, plant. Any of a large number of organic natural colorants produced by living plants, with the exception of fungi and lichens. They may be classified into three groups; further information is given in specific entries.

(1) The chlorophylls (types a, b, and c): Green color. They are magnesium-containing porphyrins, and are technically considered to be microcrystalline waxes.

(2) The carotenoids: yellow and orange colors
(a) Carotene (straight-chain hydrocarbon)
(b) Xanthophyll (straight-chain hydrocarbon containing two oxygen molecules)

(3) The flavanoids: red, yellow, blue, orange, ivory colors. They are oxygen-containing heterocyclic compounds.

(a) catechins
(b) flavones, flavanols, anthocyanins
(c) flavanones and leucoanthocyanidins
(d) flavonols

Some of these pigments can be made synthetically. They have limited use as textile colorants and pharmaceutical products.

pigment, precipitated. See lake.

pigment volume concentration. See PVC (2).

Pigment Yellow 12 $C_{32}H_{26}Cl_2N_6O_4$. A yellow diazo pigment. C.I. No. 21090. See diazotization.

Preparation: Condensation of 3,3'-dichlorobenzidine di-diazotate with acetoacetanilide.

Uses: Printing inks; lacquers resistant to heat and solvents; in rubber and resins; in paper coloring, textile printing.

"Pilate" Fast Dyes. ⁴⁴⁰ Trademark for 1:1 metal complex dyes for dyeing and printing textiles of animal fibers and union materials of wool and nylon fibers.

pilchard oil. An oil expressed from the pilchard fish, a member of the herring family.

Properties: Pale yellow liquid; deposits stearin on long standing; sp. gr. 0.931-0.933; saponification value 186-189.6; refractive index 1.4751 (40°C). Combustible; nontoxic.

Uses: Potash soft soap; paints.

pilot plant. An operation intermediate between laboratory conditions (q.v.) and full-scale production. It is an essential step in chemical engineering development of a product. See also scale-up.

***l*-pimaric acid** (levopimaric acid) $C_{30}H_{50}O_2$.

Properties: Solid; m.p. 150°C; optical rotation $[\alpha]_{20/D} -280^\circ$ ($c = 0.7$ in alcohol). Soluble in most organic solvents; insoluble in water. Combustible; low toxicity.

Derivation: From pine gum.

Use: Resins (see maleo-pimaric acid).

pimelic acid (1,7-heptanedioic acid)

$HOOC[CH_2]_5COOH$.

Properties: Crystals; m.p. 105-106°C; slightly soluble in water; soluble in alcohol and ether; nearly insoluble in cold benzene. Combustible; low toxicity.

Derivation: From castor oil.

Use: Biochemical research; polymers; plasticizers.

pimelic ketone. See cyclohexanone.

pindone. Coined name for the insecticide 2-pivaloyl-1,3-indandione (q.v.).

Hazard: Highly toxic. Tolerance, 0.1 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Poison label.

alpha-pinene $C_{10}H_{16}$. A terpene hydrocarbon derived from sulfate wood turpentine.

Properties: Colorless, transparent liquid; terpene odor; sp. gr. 0.8620-0.8645 (15.5/15.5°C); refractive index ($n_{20/D}$) 1.4655-1.4670; boiling range 95% between 156-160°C; f.p. -40°C; flash point 90°F (TCC); occurs in *d*-, *l*-, and racemic forms.

Containers: Tank cars and galvanized drums.

Hazard: Flammable, moderate fire risk.

Uses: Solvent for protective coatings, polishes, and waxes; synthesis of camphene, camphor, geraniol, terpin hydrate, terpineol, synthetic pine oil, terpene esters and ethers, lube oil additives, synthetic resins, and their derivatives; flavoring; odorant.

beta-pinene (nopinene) $C_{10}H_{16}$. A terpene hydrocarbon derived from sulfate wood turpentine.

Properties: Colorless, transparent liquid; terpene odor; sp. gr. 0.8740-0.8770 (15.5/15.5°C); refractive index ($n_{20/D}$) 1.4775-1.4790; boiling range 95% between 164-169°C; flash point 117°F; levorotatory. Combustible.

Containers: Tank cars and galvanized drums.

Hazard: Moderate fire risk.

Uses: Polyterpene resins; may be substituted for alpha-pinene; intermediate for perfumes and flavorings.

pinene hydrochloride. See bornyl chloride.

pine oil.

Properties: Colorless to light amber liquid having a strong, piny odor; miscible with alcohol in all proportions; sp. gr. 0.927-0.940; refractive index 1.4780-1.4820 (20°C) distilling range 200-225°C. Flash point 172°F (C.C.). Combustible; low toxicity.

Chief constituents: Tertiary and secondary terpene alcohols.

Derivation: From the wood of *pinus palustris* by extraction and fractionation, or by steam distillation; also from turpentine.

Containers: Bottles; drums.

Grade: N.F.

Uses: Odorant; disinfectant; penetrant; wetting agent; preservative (textile and paper industries); laboratory reagent.

pine tar

Properties: Sticky, viscous, dark brown to black liquid or semisolid with strong odor and sharp taste.

Translucent in thin layers; hardens with aging. Sp. gr. 1.03–1.07; boiling range 240–400°C. Flash point 130°F (C.C.). Low toxicity. Soluble in alcohol, acetone, fixed and volatile oils and in sodium hydroxide solution; slightly soluble in water. Combustible.

Chief constituents: Complex phenols; turpentine, rosin, toluene, xylene and other hydrocarbons.

Derivation: By destructive distillation of pine wood, especially *Pinus palustris*.

Grades: Kiln burnt; retort; N.F.

Containers: Tanks, drums, and barrels.

Hazard: Moderate fire risk. Subject to spontaneous heating.

Uses: Ore flotation; roofing compositions; paints and varnishes; softener in plastics and rubber processing; tar soaps; deKhotinsky cement; asphaltic compositions; marine preservative; medicine (cough syrups); laboratory reagent.

pine-tar oil. See tar oil, wood.

pine-tar pitch. The residue after distillation of practically all the volatile oils from pine tar. Similar to coal-tar pitch.

"Pipanol" Hydrochloride.¹⁶² Trademark for trihexyphenidyl hydrochloride.

2-pipecoline. See 2-methylpiperidine.

alpha-pipecoline. See 2-methylpiperidine.

piperalin [3-(2-methylpiperidino)propyl-3,4-dichlorobenzoate] $\text{CH}_3\text{C}_6\text{H}_3\text{N}(\text{CH}_2)_3\text{OC}(\text{O})\text{C}_6\text{H}_3\text{Cl}_2$.

Properties: Amber liquid; b.p. 156–157°C (0.2 mm). Slightly soluble in water; miscible in paraffin hydrocarbon, aromatic hydrocarbon, and chlorinated hydrocarbon solvents.

Hazard: May be toxic.

Use: Fungicide.

piperazidine. See piperazine.

piperazine (diethylenediamine; pyrazine hexahydride; piperazidine) $\text{NHCH}_2\text{CH}_2\text{NHCH}_2\text{CH}_2$.

Properties: Colorless, deliquescent, transparent, needle-like crystals, which absorb carbon dioxide from the air. Soluble in water, alcohol, glycerol, and glycols. M.p. 104–107°C; b.p. 145°C. Flash point 190°F. Combustible; low toxicity.

Derivation: Treatment of ethylene bromide or chloride with alcoholic ammonia at 100°C.

Containers: Glass bottles; drums.

Uses: Corrosion inhibitor; anthelmintic; insecticide. Accelerator for curing polychloroprene.

piperazine calcium edetate. USAN name for [dihydrogen(ethylenedinitrilo)tetraacetato]calcium piperazine salt; formerly piperazine calcium edathamil) $\text{C}_{14}\text{H}_{24}\text{N}_4\text{O}_8\text{Ca}$. A chelate compound produced by reacting EDTA with calcium carbonate and piperazine. Used in medicine.

piperazine dihydrochloride $\text{C}_4\text{H}_{10}\text{N}_2 \cdot 2\text{HCl}$.

Properties: White needles. Soluble in water.

Uses: Fibers; insecticides; pharmaceuticals. The monochloride, $\text{C}_4\text{H}_{10}\text{N}_2 \cdot \text{HCl}$, is also commercially available.

piperazine hexahydrate $\text{C}_4\text{H}_{10}\text{N}_2 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals; m.p. 44°C. Soluble in water and alcohol.

Uses: Fibers; insecticides; pharmaceuticals; laboratory reagent.

"Pipersin."¹⁸⁸ Trademark for a substitute for oleoresin of black pepper. Officially recognized by USDA

Meat Inspection Division for use under its supervision.

piperidine (hexahydropyridine; pentamethyleneamine)

$\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{NH}$. Completely saturated ring compound.

Properties: Colorless liquid with odor of pepper; sp. gr. 0.862; b.p. 106°C; f.p. –7° to –9°C. Soluble in water, alcohol, and ether. It is a strong base. Combustible.

Derivation: By electrolytic reduction of pyridine.

Grades: 95% and 98% pure.

Containers: Drums.

Hazard: Strong irritant. Moderately toxic by ingestion.

Uses: Solvent and intermediate; curing agent for rubber and epoxy resins; catalyst for condensation reactions; ingredient in oils and fuels; complexing agent.

piperidine pentamethylene dithiocarbamate ("Pip-pip") $\text{C}_{11}\text{H}_{22}\text{N}_2\text{S}_2$.

Properties: White powder.

Hazard: Strong irritant to eyes and skin.

Use: Ultra-accelerator for rubber.

2-piperidinoethanol (N-2-hydroxyethylpiperidine)

$\text{C}_5\text{H}_{10}\text{NCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid. Sp. gr. 0.972–0.974 (20/4°C); b.p. 115–117°C (45 mm); refractive index (n_D²⁰) 1.478–1.480. Miscible with water and most organic solvents in all proportions.

Use: Intermediate.

piperocaine hydrochloride $\text{C}_{16}\text{H}_{23}\text{NO}_2 \cdot \text{HCl}$. (3-(2-Methyl-1-piperidyl) propyl benzoate hydrochloride.

Properties: White crystalline powder; odorless and stable in air; m.p. 172–175°C; bitter taste. Solution (1 in 10) acid to litmus. Soluble in water, alcohol, and chloroform; almost insoluble in ether and fixed oils.

Use: Medicine.

piperonal (heliotropin; piperonyl aldehyde; 3,4-methylenedioxybenzaldehyde) $\text{C}_6\text{H}_3(\text{CH}_2\text{OO})\text{CHO}$ (bicyclic).

Properties: White, shining crystals; turns red-brown on exposure to light; floral odor; m.p. 35.5–37°C; b.p. 263°C; soluble in alcohol and ether; insoluble in water and glycerol. Combustible; low toxicity.

Derivation: By oxidation of isosafrole.

Grades: Technical; F.C.C.

Uses: Medicine; perfumery; suntan preparations; mosquito repellent; laboratory reagent; flavoring.

piperonyl butoxide. Generic name for alpha-[2-(2-butoxyethoxy)-ethoxy]-4,5-(methylenedioxy)-2-propyltoluene.

$\text{C}_3\text{H}_7\text{C}_6\text{H}_2(\text{OCH}_2\text{O})\text{CH}_2\text{OC}_2\text{H}_4\text{OC}_2\text{H}_4\text{OC}_6\text{H}_5$.

Properties: Light-brown liquid; mild odor; insoluble in water; soluble in alcohol, benzene, petroleum hydrocarbons. Sp. gr. 1.06 (25°C); refractive index 1.50 (20°C); b.p. 180°C (1 mm). Flash point 340°F; combustible; low toxicity.

Containers: Glass bottles; tins; drums.

Use: Synergist in insecticides in combination with pyrethrins in oil solutions, emulsions, powders or aerosols; permissible animal food additive.

piperonyl cyclonene. Generic name for a mixture of 3-alkyl-6-carbethoxy-5-(3,4-methylenedioxyphenyl)-2-cyclohexen-1-one, and 3-alkyl-5-(3,4-methylenedioxyphenyl)-2-cyclohexen-1-one, $(\text{CH}_2\text{O})_2\text{C}_6\text{H}_3\text{CHCH}_2\text{C}(\text{O})\text{CH}:\text{CRCH}_2$. R is usually

C_6H_{13} .

Properties: Red liquid; insoluble in water, oils and

refrigerant 12. Flash point 290°F; combustible; low toxicity.

Use: Synergist in insecticides in combination with rotenone, pyrethrins or rotenone-pyrethrin mixtures in oil solutions, emulsions, or powders; permissible animal food additive.

piperylene (1,3-pentadiene) $\text{CH}_2\text{:CHCH:CHCH}_3$. Cis- and trans- forms.

Properties: Colorless liquid; sp. gr. 0.693 (60/60°F); f.p. cis -141°C , trans -87°C ; b.p. cis -44°C , trans -42°C ; refractive index ($n_{20/D}$) cis 1.43634; trans 1.43008. Insoluble in water; soluble in alcohol and ether. Flash point (mixture) -20°F .

Hazard: Highly flammable, dangerous fire risk.

Uses: Polymers; maleic anhydride adducts; intermediate.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

"Pipron."⁵³⁰ Trademark for piperalin; used for control of powdered mildew.

pitch. See coal-tar pitch; glance pitch; Burgundy pitch; fatty acid pitch; asphalt; pine tar pitch.

pitchblende. A massive variety of uraninite (q.v.), or uranium oxide, found in metallic veins. Contains 55–75% UO_2 ; up to 30% UO_3 ; usually a little water, and varying amounts of other elements. Thorium and the rare earths are generally absent.

Properties: Color black; streak brownish black; luster pitchy to dull; Mohs hardness 5.5; sp. gr. 6.5–8.5.

Occurrence: Congo; Canada; Colorado; Europe.

Hazard: Radioactive material.

Uses: Most important ore of uranium; original source of radium.

"Pitocin."³³⁰ Trademark for a sterile, aqueous solution of oxytocin injection.

"Pittabs."¹⁷⁷ Trademark for calcium hypochlorite (70% available chlorine) in tablet form.

"Pittchlor."¹⁷⁷ Trademark for granular calcium hypochlorite (70% available chlorine).

"Pitt-Consol."⁵⁴⁵ Trademark for a group of phenols, cresols, cresylic acids, rubber chemicals, aryl mercaptans, and alkyl phenols.

pituitary. The extract obtained from the posterior lobe of the pituitary gland of hogs, sheep, etc.

Properties: Yellow or grayish amorphous powder with characteristic odor; partially soluble in water.

Grade: U.S.P.

Use: Medicine (hormone).

pivalic acid. See trimethylacetic acid.

2-pivaloyl-1,3-indandione (pivalyl-1,3-indandione; pin-done) $\text{C}_9\text{H}_5\text{O}_2\text{C(O)C(CH}_3)_3$.

Properties: Bright yellow powder or crystals; m.p. 109°C . Insoluble in water; soluble in most organic solvents.

Hazard: Highly toxic by inhalation and ingestion. Tolerance, 0.1 mg per cubic meter of air.

Uses: Rodenticide; insecticide; pharmaceutical intermediate.

Shipping regulations: (Rail, Air) Poison label.

pK. A measurement of the completeness of an incomplete chemical reaction. It is defined as the negative logarithm (to the base 10) of the equilibrium constant, K , for the reaction in question. The pK is most frequently used to express the extent of disso-

ciation or the strength of weak acids, particularly fatty acids, and amino acids, and also complex ions, or similar substances. The weaker an electrolyte the larger its pK. Thus, at 25°C for sulfuric acid (strong acid), pK is about -3.0 ; acetic acid (weak acid), pK = 4.76; boric acid (very weak acid), pK = 9.24. In a solution of a weak acid, if the concentration of undissociated acid is equal to the concentration of the anion of the acid, the pK will be equal to the pH (q.v.).

planetology, chemical. See chemical planetology.

plant. (1) Any of a broad group of living organisms comprised of all types of vegetation that contain chlorophyll (algae, mosses, grasses, vegetables, trees, etc., but excluding fungi). Their metabolic processes are vital to the maintenance of life on earth, and result in the following products: (1) oxygen (from respiration); (2) carbohydrates (from photosynthesis); (3) amino acids and proteins (from nitrates and nitrogen-fixing bacteria); (4) fats and oils; (5) vitamins; (6) natural fibers; (7) coal; (8) various other substances of value such as alkaloid drugs, rubber, etc. See also photosynthesis; phytochemistry.

(2) Any large-scale manufacturing unit, including pipelines, reaction equipment, machinery, etc.

plant growth regulator. An organic compound that modifies or controls one or more specific physiological processes within the plant. If the compound is produced by the plant it is called a plant hormone, e.g., auxin, which regulates the growth of longitudinal cells involved in bending of the stem one way or another. Substances applied externally also bring about modifications such as improved rooting of cuttings, increased rate of ripening (ethylene), and easier scission (separation of fruit from stem). A large number of chemicals tend to increase the yield of certain plants such as sugar cane, corn, etc. See dinitrobutylphenol; kinin; gibberellin; abscisin.

"Plaquenil" Sulfate.¹⁶² Trademark for hydroxychloroquine sulfate.

"Plasdone."³⁰⁷ Trademark for the pharmaceutical grade of polyvinylpyrrolidone.

Uses: Tablet binding and coating agent; detoxicant and demulcent lubricant in ophthalmic preparations; film forming agent in medical aerosols.

"Plaskon."¹⁷⁵ Trademark for plastics and resins including alkyd, urea, melamine, and nylon molding compounds; polyester, coating, foundry, bonding, impregnating, chlorotrifluoroethylene resins; adhesives; hardeners; phenolic laminating varnishes.

210-577A. A polyolefin designed for fabrication of tape for insulating computer cable; available in resin form or as specification product.

FR 1050. A flame-retardant polypropylene resin; continuous-use at 100°C ; used as TV tube sockets, structural parts for appliances, etc.

"Plaslube."⁵³⁹ Trademark for unreinforced thermoplastics with lubricating additives; includes nylons, polycarbonates, and acetals with various concentrations of molybdenum disulfide and/or "Teflon."

plasma. (1) The portion of the blood remaining after removal of the white and red cells and the platelets; it differs from serum in that it contains fibrinogen, which induces clotting by conversion into fibrin by activity of the enzyme thrombin. Plasma is made up of over 40 proteins, and also contains acids, lipids

and metal ions. It is an amber, opalescent solution in which the proteins are in colloidal suspension and the solutes (electrolytes and nonelectrolytes) are either emulsified or in true solution. The proteins can be separated from each other and from the other solutes by ultrafiltration, ultracentrifugation, electrophoresis, and immunochemical techniques.

(2) The mixture of electrons and gaseous ions formed when any substance is heated to the range of 10,000 to 50,000°F. A plasma may be formed by an electric arc of sufficient power, by sonic shock waves, or by other very sudden releases of very large quantities of energy, as in nuclear processes of fission or fusion. Uses are for spraying heat resistant coatings on missile cone surfaces and rocket nozzles, and high temperature research chemistry and physics. Hydrogen, deuterium, and tritium plasmas are involved in the development of fusion power, on which intensive research is in progress.

plasma volume expander. A substance used to partially or wholly replace blood plasma in treatment of the injured. Most important are gelatin, polyvinylpyrrolidone, and dextran.

plasmin. See fibrinolysin.

"Plastacele."²⁸ Trademark for cellulose acetate flake, a fine white powder used for molding powders, films, sheets, rods and tubes.
Containers: 50-lb paper bags.

"Plast-Alloy."²⁹⁶ Trademark for ferro-alloy powder, such as ferroaluminum, ferrotitanium, etc. Used in sintered permanent magnets.

plaster of Paris. See calcium sulfate.

"Plastex."¹⁶⁰ Trademark for wires and cables with oilproof and flameproof polyvinyl chloride insulation which resists the action of oxygen, ozone, and sunlight; has high dielectric strength, high resistance to water, acids, and alkalies. It is firm, dense, and has a smooth finish. Supplied in several colors.

"Plastibase."⁴¹² Trademark for plasticized hydrocarbon gel, a polyethylene and liquid petrolatum gel base.

plastic. (1) Capable of being shaped or molded, with or without the application of heat. Soft waxes and moist clay are good examples of this property. See also plasticity.

(2) A high polymer, usually synthetic, combined with other ingredients, such as curatives, fillers, reinforcing agents, colorants, plasticizers, etc.; the mixture can be formed or molded under heat and pressure in its raw state, and machined to high dimensional accuracy, trimmed and finished in its hardened state. The thermoplastic type can be resoftened to its original condition by heat; the thermosetting type cannot.

Plastics in general (including all forms) are sensitive to high temperatures, among the more resistant being fluorocarbon resins, nylon, phenolics, polyimides, and silicones, though even these soften or melt above 500°F. Other types are combustible when exposed to flame for a short time (polyethylene, acrylic polymers, polystyrene), and still others burn with evolution of toxic fumes (polyurethane).

Engineering plastics are those to which standard metal engineering equations can be applied; they are capable of sustaining high loads and stresses, and are machinable and dimensionally stable. They are used in construction, as machine parts, automobile components, etc. Among the more important are

nylon, acetals, polycarbonates, ABS resins, PPO/styrene, and polybutylene terephthalate.

Fibers, films, and bristles are examples of extruded forms. Plastics may be shaped by either compression molding (direct pressure on solid material in a hydraulic press) or injection molding (ejection of a measured amount of material into a mold in liquid form). The latter is most generally used, and articles of considerable size can be produced. Because of their dielectric and non-toxic properties, plastics are essential components of electrical and electronic equipment (especially for use within the human body).

Plastics can be made into flexible and rigid foams by use of a blowing agent; they are light and strong, and the rigid type is machinable. These forms are collectively called cellular plastics (q.v.). Plastics can also be reinforced, usually with glass or metallic fibers for added strength. They are laminated to paper, cloth, wood, etc. for many uses in the packaging, electrical and furniture industries; they also can be metal-plated. Plastic pipe (q.v.) is widely used for underground transportation of gases and liquids over long distances, as well as intraplast.

Several natural materials (waxes, clays, and asphalt) have rheological properties similar to synthetic products, but as they are not polymeric, they are not considered true plastics. Certain proteins (casein, zein) are natural high polymers from which plastics are made (buttons, and other small items), but they are of decreasing importance.

Plastics have permeated industrial technology. Not only have they replaced and improved upon many materials formerly used, but also have made possible industrial and medical applications that would have been impracticable with older technologies. Use of plastics in the U.S. has been authoritatively estimated at close to 60 billion pounds a year by 1980, which is twice the 1970 consumption. Their major application areas are:

- (1) automobile bodies and components; boat hulls
- (2) building and construction (siding, piping, insulation, flooring)
- (3) packaging (vapor-proof barriers; display cartons; bottles; drum linings)
- (4) textiles (carpets, cordage, suiting, hosiery, drip-dry fabrics, etc.)
- (5) organic coatings (paint and varnish vehicles)
- (6) adhesives (plywood, reinforced plastics, laminated structures)
- (7) pipelines
- (8) electrical and electronic components.
- (9) surgical implants
- (10) miscellaneous (luggage, toys, tableware, brushes, furniture, etc.)

For additional information refer to Society of the Plastics Industry, 250 Park Ave., New York.

See also polymer, high; cellular plastic; reinforced plastic; foam, plastic; plastic pipe.

plastic flow. A type of rheological behavior in which a given material shows no deformation until the applied stress reaches a critical value, called the yield value. Most of the so-called plastics do not exhibit plastic flow. Common putty is an example of a material having plastic flow.

plastic foam. See foam, plastic; cellular plastic.

plastic, reinforced. See reinforced plastic.

plasticity. A rheological property of solid or semi-solid materials expressed as the degree to which they will flow or deform under applied stress, and

retain the shape so induced, either permanently or for a definite time interval. It may be considered the reverse of elasticity (q.v.). Application of heat and/or special additives is usually required for optimum results. See also thermoplastic; plasticizer.

plasticizer. An organic compound added to a high polymer both to facilitate processing and to increase the flexibility and toughness of the final product by internal modification (solvation) of the polymer molecule. The latter is held together by secondary valence bonds; the plasticizer replaces some of these with plasticizer-to-polymer bonds, thus aiding movement of the polymer chain segments. Plasticizers are classed as primary (high compatibility) and secondary (limited compatibility). Polyvinyl chloride and cellulose esters are the largest consumers of plasticizers; they are also used in rubber processing. Among the more important plasticizers are nonvolatile organic liquids and low-melting solids, e.g., phthalate, adipate and sebacate esters, polyols such as ethylene glycol and its derivatives, tricresyl phosphate, castor oil, etc. Camphor was used in the original modification of nitrocellulose to "Celluloid." See also plastisol; softener.

"Plasticone Red."¹⁴¹ Trademark for light, medium, and deep shades of pyrazolone red pigments. Used in paints, enamels, lacquers, plastics, rubber, printing inks, textiles, and floor coverings.

plastic pipe. Tubes, cylinders, conduits and continuous length piping made (1) from thermoplastic polymers unreinforced (polyethylene, polyvinyl chloride, ABS polymers, polypropylene) or (2) from thermosetting polymers (polyesters, phenolics, epoxies) blended with 60–80% of such reinforcing materials as chopped asbestos or glass fibers to increase strength. The latter type is a reinforced plastic (q.v.). In general the properties of plastic tubing or pipe are those of the polymers that comprise it. Most have good resistance to chemicals, corrosion, weathering, etc., combined with flexibility, light weight, and high strength. They are combustible but generally slow-burning. The reinforced type is widely used as underground conduit for transportation of gases and fluids, including city water services, sewage disposal systems, etc. Its use in buildings is subject to local building codes. See Plastics Pipe Institute, 250 Park Avenue, New York, for further details.

"Plastic Steel."⁴⁴⁵ Trademark for product composed of 80% steel and 20% plastic; used for repairing chemical and other equipment.

"Plastifix PC."⁴⁷⁰ Trademark for a polychloroprene-based resin for corrosion-resistant, elastic metal coatings.

"Plast-Iron."²⁹⁶ Trademark for high purity electrolytic iron powder and reduced iron oxide powder, annealed and unannealed.
Uses: Powder enrichment, catalyst, pole pieces, magnets, electronic cores, welding rod coatings, sintered structural parts and oil-less bearings.

plastisol. A dispersion of finely divided resin in a plasticizer. A typical composition is 100 parts resin and 50 parts plasticizer, forming a paste that gels when heated to about 300°F as a result of solvation of the resin particles by the plasticizer. If a volatile solvent is included, the plastisol is called an organosol (q.v.). Plastisols are used for molding thermo-

plastic resins, chiefly polyvinyl chloride. See also plasticizer.

"Plast-Manganese."²⁹⁶ Trademark for electrolytic manganese powder. Used for welding rod coatings, pyrotechnics and fuses.

"Plast-Nickel."²⁹⁶ Trademark for nickel powder. Used in welding rod coatings, sintered permanent magnets, filters and parts.

"Plasto."²⁴³ Trademark for a series of liquid plasticizers used in lacquer coatings and PVC.

"Plastogen."^{69,466} Trademark for a plasticizing agent. Properties: Liquid, amber to mahogany; sp. gr. 0.81–0.84; acid number 1.0–1.1).

Uses: Plasticizer and softener in all elastomers; effective in sponge rubber.

"Plastolein."²⁴² Trademark for vinyl plasticizers, including di-n-hexyl azelate; diethylene glycol dipelargonate; diisooctyl azelate; di-2-ethylhexyl azelate; tetrahydrofurfuryl oleate; triethylene glycol dipelargonate.

"Plast-Silicon."²⁹⁶ Trademark for silicon powder. Used in fuses and pyrotechnics.

platelet (thrombocyte). A proteinaceous cellular structure occurring in blood in the amount of 150–500 × 10³ units per cubic millimeter. Platelets range from 2 to 4 microns in diameter, and contain no nuclei. They are rich in amine compounds which constrict the blood vessels at the site of an injury, to which the platelets adhere; on dissolution they release thromboplastin which initiates the coagulation mechanism. See also blood; fibrinogen; thrombin.

"Platfining."⁴¹⁶ Proprietary process for the treatment of hydrocarbon mixtures to remove deleterious materials such as sulfur and nitrogen compounds with no substantial decrease in the aromatic content, by treating the hydrocarbon mixtures with hydrogen in the presence of a solid catalyst containing platinum or platinum compounds.

"Platforming."⁴¹⁶ Proprietary process using special platinum-containing catalyst for making high-octane gasoline and/or a highly aromatic fraction for subsequent recovery of pure aromatics. Reactions include aromatization, dehydrogenation, cyclization, isomerization and hydrocracking. Reaction product may contain up to 60% aromatics. By-product hydrogen also is produced.

platonic ammonium chloride. See ammonium hexachloroplatinate.

platonic chloride. See chloroplatinic acid; platinum chloride.

platonic sal ammoniac. See ammonium hexachloroplatinate.

platonic sodium chloride. See sodium chloroplatinate.

platonic sulfate. See platinum sulfate.

platinous-ammonium chloride. See ammonium chloroplatinite.

platinous chloride. See platinum dichloride.

platinous iodide. See platinum iodide.

platinum Pt Metallic element of atomic number 78, group VIII of the periodic system. Atomic weight 195.09; valences 2, 4. There are 5 stable isotopes.

Properties: Silvery white ductile metal. Insoluble in mineral and organic acids; soluble in aqua regia. Attacked by fused alkalis. Sp. gr. 21.45; m.p. 1769°C; b.p. $3827 \pm 100^\circ\text{C}$; Brinell hardness, 97; annealed (Vickers) 42. Nontoxic. Does not corrode or tarnish. Heated platinum absorbs large volumes of hydrogen. It is also a strong complexing agent. Occurrence: Canada (Ontario), South Africa, U.S.S.R., Alaska. Usually mixed with ores of copper, nickel, etc.

Derivation: By dissolving the ore concentrate in aqua regia, precipitating the platinum by ammonium chloride as ammonium hexachloroplatinate, igniting the precipitate to form platinum sponge. This is then melted in an oxyhydrogen flame or in an electric furnace.

Grades: Physically pure (99.99%); chemically pure (99.9%); crucible platinum (99.5%); commercial (99.0%).

Forms available: Powder (platinum black); single crystals; wire (2" by .05-.005 diam.); special compositions for electronics, metallizing, and decorating ceramics and metals.

Hazard: Flammable in powdered form. Soluble salts are toxic.

Uses: Catalyst (nitric acid, sulfuric acid, high-octane gasoline, automobile exhaust gas converters); laboratory ware; spinnerets for rayon and glass fiber manufacture; jewelry; dentistry; electrical contacts; thermocouples; surgical wire; bushings; electroplating; electric furnace windings; chemical reaction vessels; permanent magnets.

platinum-ammonium chloride. See ammonium hexachloroplatinate and ammonium chloroplatinate.

platinum barium cyanide. See barium cyanoplatinite.

platinum black. Finely divided metallic platinum.

Properties: Black powder; exhibits a metallic luster when rubbed. Soluble in aqua regia. Sp. gr. 15.8-17.6 (apparent).

Derivation: Reduction of solution of a platinum salt with zinc or magnesium.

Hazard: Flammable when dispersed in air.

Uses: Catalyst; absorbent of gases (hydrogen, oxygen, etc.) which it again liberates at red-heat; gas ignition apparatus.

platinum chloride (platinum tetrachloride; platonic chloride) (a) PtCl_4 ; (b) $\text{PtCl}_4 \cdot 5\text{H}_2\text{O}$. The platinum chloride of commerce is usually chloroplatinic acid (q.v.).

Properties: (a) Brown solid; (b) red crystals. Soluble in water and alcohol. (a) Sp. gr. 4.30 (25°C); decomposes at 370°C. (b) Sp. gr. 2.43; m.p., loses $4\text{H}_2\text{O}$ at 100°C.

Derivation: By solution of platinum in aqua regia and evaporation.

Hazard: Toxic. Tolerance (as Pt), 0.002 mg per cubic meter of air.

Use: Chemical reagent.

platinum-cobalt alloy. A 76.7 Pt/23.3 Co alloy forms a more powerful permanent magnet than any other known.

platinum dichloride (platinous chloride) PtCl_2 .

Properties: Greenish gray powder which forms double salts with the chlorides of the alkali metals. Soluble in hydrochloric acid and ammonium hydroxide; insoluble in water. Sp. gr. 5.87; m.p., is decomposed at red heat, yielding platinum.

Derivation: (a) By heating platinum sponge in presence of dry chlorine; (b) by heating chloroplatinic acid to 200°C.

Hazard: May be toxic.

Use: Platinum salts.

platinum iodide (platinous iodide; platinum diiodide) PtI_2 .

Properties: Heavy, black powder. Slightly soluble in hydriodic acid; insoluble in alkalis, water. Sp. gr. 6.4; m.p. 300-350°C (dec).

platinum-iridium alloy. The most important platinum alloy. Commercial alloys contain 1-30% iridium. As the iridium is increased the hardness of the alloy increases, as does the resistance to chemical attack. The m.p. of platinum is raised by the addition of iridium.

Uses: Jewelry ("medium" platinum is 95% Pt, 5% Ir and "hard" platinum is 90% Pt, 10% Ir); electrical contacts (10-25% Ir); fuse wire (10-20% Ir), hypodermic needles (20-30% Ir), and in general where high corrosion resistance is needed. See also iridium.

platinum-lithium LiPt_2 . Brittle, solid, nonreactive with water, made by direct combination at 540°C. If the lithium and platinum are combined at 200°C, the product can be decomposed by water, hydrolyzing and dissolving the lithium, and leaving unusually active platinum catalyst.

platinum metal. Any of a group of six metals, all members of group VIII of the periodic system: ruthenium, rhodium, palladium, osmium, iridium, and platinum. All of these are also transition metals.

platinum potassium chloride. See potassium chloroplatinate.

platinum-rhodium alloy. An alloy containing up to 40% rhodium, balance platinum. Such alloys are harder than platinum, but not as hard as the corresponding platinum-iridium alloys. The addition of rhodium to platinum increases the resistance to attack by aqua regia. The melting points of the alloys are higher than that of platinum.

Uses: Catalyst in nitric acid production; high temperature vessels; furnace resistors; thermocouples and resistance thermometers; spinneret nozzles.

platinum sodium chloride. See sodium chloroplatinate.

platinum sponge.

Properties: Grayish black, porous mass of finely divided platinum. Soluble in aqua regia.

Derivation: By ignition of ammonium hexachloroplatinate, or other salts.

Uses: Catalyst; ignition of hydrogen.

See also platinum black.

platinum sulfate (platonic sulfate) $\text{Pt}(\text{SO}_4)_2$.

Properties: Greenish black mass. Hygroscopic. Soluble in acids (dilute), alcohol, ether, water.

Use: Analysis (microtesting for bromine, chlorine, iodine).

platinum tetrachloride. See platinum chloride.

"Platreating."⁴¹⁶ Proprietary process for treatment of hydrocarbon mixtures without cracking to remove deleterious materials such as sulfur and nitrogen compounds and/or to effect an increase in the hydrogen content of such mixtures. The catalyst used contains platinum or platinum compounds. Commercial application has been directed to the cleanup of aromatic-rich streams for the production of high-purity benzene, toluene and xylene.

"Plexiglas."²³ Trademark for thermoplastic poly(methyl methacrylate)-type polymers. Available in bead or granule form and sheets.

Uses: Manufacture of lenses, ornaments, letters for signs, aircraft canopies and windows, light diffusers, industrial and architectural glazing, chalkboards, boat windshields, and similar products.

"Plixel."²³ Trademark for synthetic lubricants and additives for petroleum oils. Most grades are diesters of dibasic acids, some are polyesters or polyether alcohols. The ester lubricants have very low freezing points, high flash points, little change of viscosity with temperature.

Uses: Aircraft engine lubricants, hydraulic systems, instrument oils, petroleum-base lubricant formulation.

"Pliobond."²⁶⁵ Trademark for general-purpose solvent-type thermoplastic adhesives which form good bonds with most like and unlike surfaces. Adheres well to wood glass, ceramics, metals, many plastics, leather, rubber, concrete, and plaster. May be employed as a wet adhesive, by solvent reactivation, or by the use of heat.

"Plioflex."²⁶⁵ Trademark for a series of staining and nonstaining synthetic dry elastomers produced by emulsion polymerization. These rubbers are either styrene/butadiene or polybutadiene polymers. All are protected with antioxidants.

"Pliogrip."²⁶⁵ A two-component adhesive for glass-reinforced plastics; it forms a highly cross-linked polymer on setting.

"Pliolite" Latexes.²⁶⁵ Trademark for a series of styrene/butadiene synthetic latexes.

"Pliolite" Rubber Reinforcing Resins.²⁶⁵ Trademark for a series of high-styrene/butadiene resins that provide effective reinforcement for SBR, NBR, neoprene and natural rubbers. Specifically developed for electrical applications.

"Pliolite" Solution Resins.²⁶⁵ Trademark for a series of hard, thermoplastic resins for use in paint finishes, paper and packaging coatings, printing inks and adhesives.

"Pliopave."²⁶⁵ Trademark for a series of rubber latexes used specifically as modifiers of bituminous paving materials. The series is composed of polymers of styrene/butadiene, acrylonitrile/butadiene and others.

"Pliovic" Vinyl Resins.²⁶⁵ Trademark for a group of thermoplastic resins composed of polymers and copolymers consisting of 50% or more vinyl chloride. Supplied in the form of fine white powders, the resins are easily compounded and formed into finished goods by extruding, calendering, compression molding, injection molding and blow molding.

plumbic acid, anhydrous. See lead dioxide.

plumbo-plumbic oxide. See lead oxide, red.

"Plumb-O-Sil" B and C.³⁰⁴ Trademark for coprecipitates of lead orthosilicate and silica gel.

Properties: Soft white powders; sp. gr. (B) 3.9, (C) 3.1; refractive index, (B) 1.58-1.60, (C) 1.58.

Containers: Up to 150-lb fiberboard drums.

Uses: Translucent and colored vinyl film, sheeting, and upholstery stocks; as vinyl stabilizers.

plumbous oxide. See litharge.

plumbous sulfide. See lead sulfide.

plumbum. The Latin name for lead, hence the symbol Pb and the names plumbic and plumbous.

"Pluracol."²⁰³ Trademark for a series of organic compounds used in hydraulic brake and other functional fluids; chemical intermediates; urethane foams, elastomers and coatings.

"Plurafac."²⁰³ Trademark for a series of 100% active, nonionic biodegradable surfactants of straight chain, primary aliphatic, oxyethylated alcohols designed through advanced synthesis techniques. Available in liquid, paste, flake, and solid form.

Uses: Range from light-duty hand dishwashing formulations to heavy-duty industrial detergents, rinse aids, metal cleaners, etc.

"Pluronic."²⁰³ Trademark for a nonionic series of 28 related difunctional block-polymers terminating in primary hydroxyl groups with molecular weights ranging from 1,000 to over 15,000. They are polyoxyalkylene derivatives of propylene glycol. Available in liquid, paste, flake, powder and cast-solid forms.

Uses: Defoaming agents, emulsifying and demulsifying agents, binders, stabilizers, dispersing agents, wetting agents, rinse aids, and chemical intermediates.

plutonium Pu Synthetic radioactive metallic element with atomic number 94; first prepared in 1941. Atomic weight 239.11. Valences 3, 4, 5, 6. Fifteen isotopes (from 232 to 246); six allotropic forms. Plutonium 239 (half-life 24,360 years) is produced in a nuclear reactor by neutron bombardment of the nonfissionable isotope U-238 according to the reaction:

Plutonium is readily fissionable with both slow and fast neutrons; though it can be used for nuclear weaponry, its most important application is as a controlled energy source for making electric power. One pound contains a heat energy equivalent of 10^6 kilowatt-hours. According to Glenn T. Seaborg, "in breeder reactors it is possible to create more new plutonium from U-238 than the plutonium consumed in sustaining the fission chain reaction. Because of this, plutonium is the key to unlocking the enormous energy reserves in the nonfissionable U-238." Reactor fuels containing plutonium can be either liquid or solid; since Pu forms low-melting alloys with a number of metals (gallium, bismuth, tin, iron, cobalt and nickel) these are often used as liquid reactor fuels. Cerium also may be a component.

Hazard: The most toxic of the elements and one of the most toxic substances known; dangerous ionizing radiation persists indefinitely; a powerful carcinogen. Must be handled by remote control and with adequate shielding.

See also breeder.

plutonium 242. An isotope of plutonium now available.

Hazard: Radioactive poison.

Uses: Tracer techniques; analytical chemistry.

"Plyac."⁵⁰ Trademark for polyethylene spreader-sticker; nonoily and nonionic.

"Plyacien."³⁶ Trademark for a protein base dust-free adhesive for use with the cold press no-clamp gluing process.

Use: Manufacture of interior-grade plywood.

"Plyamine."³⁶ Trademark for a group of liquid water-soluble urea-formaldehyde adhesive resins used as

binders in the manufacture of plywood, furniture, wood particle products, etc.

"Plyamul."³⁶ Trademark for polyvinyl acetate adhesive bases.

"Plyophen."³⁶ Trademark for a water-soluble impregnating resin. Penetrates deeply and quickly into wood, canvas, asbestos, paper and other laminating and molding stocks. Can be diluted as much as 8-10 parts water to 1 part resin for spraying glass fiber or rock wool.

plywood. A composite composed of thin wood veneers (with grains placed at right angles to each other) bonded with a synthetic resin, usually phenol-formaldehyde or resorcinol-formaldehyde. It is superior to metals in strength-to-weight ratio, and has low thermal expansion, high heat capacity, and low water absorption. See also laminate; composite.

Pm Symbol for promethium.

PMA. Abbreviation for phosphomolybdic acid and for pyromellitic acid.

"PMA."⁷⁴ Trademark for a series of fungicides containing phenyl mercury acetate. Used in emulsion paint and other aqueous systems.

Hazard: See mercury compounds.

"PMD-10."⁷⁴ Trademark for a mineral spirits solution of phenyl mercury oleate. Used for mildew-resistant oil, oleoresinous and alkyd paints.

Hazard: See mercury compounds.

PMDA. Abbreviation for pyromellitic dianhydride (q.v.).

PMHP. Abbreviation for para-menthane hydroperoxide. A polymerization catalyst.

PMP. Abbreviation for 1-phenyl-3-methyl-5-pyrazolone (q.v.).

PMTA. Abbreviation for a mixture of phosphomolybdic and phosphotungstic acids, used in making pigments. See phosphotungstic pigment.

pn Abbreviation for propylenediamine, as used in formulas for coordination compounds. See also dien; en; py.

PNC. Abbreviation for phosphonitrilic chloride.

"PNF."²⁷⁸ Trademark for a special-purpose synthetic rubber, a phosphonitrilic fluoroelastomer, said to be flexible at -70°F and serviceable up to 350°F. Resistant to oils over a wide temperature range. Can be processed on standard equipment.

Po Symbol for polonium.

"POCO."⁴⁸⁶ Trademark for a series of unique fine-grained, high strength, isotropic, formed graphite materials. Three basic density grades range between 1.50 and 1.88 gms/cm³; the associated flexural strengths range from 4000 to 17,250 psi.

Uses: Jigs and fixtures for electronic components; electrodes for spectrographic use; electrical discharge machining; aerospace and nuclear fields.

POEMS. Abbreviation for polyoxyethylene monostearate; see polyoxyl 40 stearate.

POEOP. See polyoxyethyleneoxypropylene.

POF. See *dl*-alpha-lipoic acid.

• : See centipoise.

• (I) Any substance that is harmful to living

tissues when applied in relatively small doses. The most important factors involved in effective dosage are (a) quantity or concentration, (b) duration of exposure, (c) particle size or physical state of the substance, (d) its affinity for living tissue, (e) its solubility in tissue fluids, and (f) the sensitivity of the tissues or organs. Sharp distinction between poisons and non-poisons is not always possible, as many variables must be taken into consideration in each case. Poisons are divided into four classes by the shipping regulatory agencies as follows. Poison A: a gas or liquid so toxic that an extremely low percentage of the gas or the vapor formed by the liquid is dangerous to life. Poison B: Less toxic liquids and solids that are hazardous either by contact with the body (skin absorption) or by ingestion. Poison C: Liquids or solids that evolve toxic or strongly irritating fumes when heated or when exposed to air (excluding Class A poisons). Poison D: Radioactive materials.

See also toxicity; toxic substances.

Note: A computerized poison information center is operated by the FDA in Washington, D.C. The national clearinghouse for poison information centers is located at 5401 Westbard Ave., Bethesda, Md., 20016.

(2) In nuclear technology, any material with a high capture probability for neutrons that may divert an undesirable number of neutrons from the fission chain reaction.

(3) A substance that reduces or destroys the activity of a catalyst. Carbon monoxide, and phosphorus, arsenic, or sulfur compounds have this effect on the formation of ammonia from hydrogen and nitrogen gases, and the gases must be highly purified to avoid this. Another example is the poisoning of the platinum catalysts used in emission-control devices by organic lead compounds.

poison gas. A toxic or irritant gas or volatile liquid designed for use in chemical warfare or riot control. They vary in toxicity from nerve gases (q.v.), which are lethal, to tear gases (lachrymators) which cause only temporary disability. See also noxious gas; chemical warfare.

polar. Descriptive of a molecule in which the positive and negative electrical charges are permanently separated, as opposed to nonpolar molecules in which the charges coincide. Polar molecules ionize in solution and impart electrical conductivity. Water, alcohol, and sulfuric acid are polar in nature; most hydrocarbon liquids are not. Carboxyl and hydroxyl groups often exhibit an electric charge. The formation of emulsions and the action of detergents are dependent on this behavior. See also dipole moment.

polarimetry. Measurement of the degrees and direction of the plane of polarized light as it passes through an optically active compound. It is used in the investigation of optical isomers, especially in analysis of sugars.

"Polaris Red."¹⁴¹ Trademark for precipitated azo pigments of a very bright, blue shade of red derived from beta-hydroxynaphthoic acid.

Uses: Printing inks, rubber, plastics.

polarized light. See nicol; polarimetry.

"Pollectron."³⁰⁷ Trademark for modified vinylpyrrolidone resins.

Properties: 40% active aqueous emulsion. Stable to intense mechanical shear, freeze-thaw cycling. Compatible with other commercial latexes.

Uses: Binding agents for wood, cotton, paper, glass

fibers; stabilizer, opacifier, and dyestuff; medium precoat for photosensitive papers. Adhesive for metal, glass, cotton, paper and wood.

"Policarb."¹⁵⁵ Trademark for carbonized nickel in which one side is a "Duocarb" finish and the other side is "Radiocarb" finish.

"Polidase."⁹¹ Trademark for cultured vegetable enzyme product.

Uses: Laboratory reagent; experimental nutrition; recovery of silver from photographic film; component of leather bates; conversion of starch in mash used for alcohol production; low cost industrial enzyme.

"Polidene."²⁶³ Trademark for a series of polyvinylidene chloride copolymer emulsions. Used in pigmented coating for textiles, paper, leather, etc.; fire retardant finishes.

polish. (1) A solid powder or a liquid or semi-liquid mixture that imparts smoothness, surface protection, or a decorative finish. The most widely used solid polishing agent is fine-ground red iron oxide (rouge), applied to the surface of plate glass, backs of mirrors, and optical glass. A wide variety of liquid and paste-like polishes are based on vegetable waxes (carnauba and candelilla), combined with softeners, fillers, and pigments or emulsified in alcohol or other solvent. Furniture polishes often contain red oil, lemon oil and petroleum solvent; most types of metal and wood polish contain organic solvents, and hence are flammable liquids. Nail polishes are nitrocellulose lacquers, usually with amyl acetate solvent. See also electro-polishing.

Hazard: (metal, furniture): May be toxic and flammable.

(2) The hard outer coating of cereal grains, especially rice, which is usually removed in processing. These coatings are rich in vitamin B₁. Their removal robs the cereal of much of its nutritive value.

"Politol."²²⁸ Trademark for high molecular weight acidic wood products which are known to precipitate protein and similar substances.

Uses: Purifying and refining aid for fats and oils.

pollucite Cs₄Al₃Si₃O₂₆ · H₂O. A natural cesium aluminum silicate found in pegmatites. Colorless; Mohs hardness 6.5; sp. gr. 2.9.

Uses: Source of cesium; catalyst; fluxes; welding materials; ion propulsion; thermocouple units.

pollution. Introduction into any environment of substances that are not normally present therein and that are potentially toxic or otherwise objectionable. The most serious atmospheric contaminants have been (a) sulfur dioxide evolved from the fuels used in electric power production and industrial processing, and (b) automobile exhaust gases rich in carbon monoxide and tetraethyllead residues. The former is being alleviated by mandatory use of low-sulfur fuels, and the latter by elimination of tetraethyllead from high-octane gasoline and by use of catalytic converters.

Water pollution due to discharge of toxic chemical wastes is closely regulated by both EPA and FDA. Such substances are defined in the 1972 amendment of the Federal Water Pollution Control Act as those "which will cause death, disease, cancer, or genetic malfunctions in any organisms with which they come into contact." Substances added to water for purification purposes, (chlorine, aluminum sulfate, etc.) are excluded from the category of pollutants.

See also Environmental Protection Agency; air pollution; water pollution.

polonium Po Radioactive element of atomic number 84, member of Group VIA of the periodic Table. Atomic weight 210; valences 2, 4, 6; there are no stable isotopes. Polonium is a member of the uranium natural radioactive decay series, occurring naturally in uranium-bearing ores; it is produced artificially by bombarding bismuth with neutrons. It has been identified in cigarette smoke (see smoke, 4). Properties: Similar to those of tellurium. M.p. 254°C; b.p. 962°C; sp. gr. 9.4. Dissolved by concentrated sulfuric and nitric acids and aqua regia, and by dilute hydrochloric acid.

Hazard: Dangerous radioactive poison.

Uses: Source of alpha radiation and neutrons; instrument calibration; oil-well logging; moisture determination; power source.

Shipping regulations: (Rail, Air) Consult regulations.

poly-. A prefix signifying many. For example, a polymer is an aggregate formed by combination of a number of single molecules. See polymer, high.

"Polyac."²⁸ Trademark for a butyl rubber conditioner containing 25% poly-para-dinitrosobenzene [C₆H₄(NO)₂]_x with an inert wax. Dark brown waxy pellets; sp. gr. 0.96. Used as a processing aid and accelerator of vulcanization for butyl rubber.

polyacetal. See acetal resin.

polyacrylamide (CH₂CHCONH₂)_x. White solid; water-soluble high polymer.

Derivation: Polymerization of acrylamide with N,N'-methylene bisacrylamide.

Uses: Thickening agent; suspending agent; production of uranium; additive to adhesives. Permissible food additive.

See also acrylic resin.

polyacrylate. See acrylic resin.

polyacrylic acid. See acrylic acid; methacrylic acid.

polyacrylonitrile. See acrylonitrile; acrylic resin; acrylic fiber.

polyalcohol. See polyol.

"Polyall."¹⁷⁵ Trademark for a series of alkyd resin-based thermosetting compounds.

Properties: Good electrical resistance; high strength; flame resistance; good dimensional stability; very fast cure; resistance to solvents and weak acids; good colorfastness in sunlight and heat; fungus-resistant; sp. gr. 2.1; heat distortion temperature, 400°F.

Available in long glass fiber-filled and mineral glass-filled grades.

polyallomer. A copolymer which has a uniform crystal structure but a mixed chemical composition. It is prepared by anionic coordination catalysis using a Ziegler catalyst (q.v.). The best-known polyallomer is a copolymer of propylene and ethylene; it has the stereoregular crystalline structure of the homopolymers of these resins, but a variable chemical composition. Temperature range -40 to 210°F. The physical properties of polyallomers are generally intermediate between those of the homopolymers of the component resins, but give a better balance of properties than blends of the homopolymers.

Uses: Vacuum-formed, injection-molded, blow-molded, and extruded products; film, sheeting, wire cables.

polyamide. A high molecular weight polymer in which amide linkages (CONH) occur along the molecular chain. They may be either natural or synthetic. Important natural polyamides are casein, soybean and peanut proteins, and zein, the protein of corn, from all of which plastics, textile fibers and adhesive compositions can be made. Synthetic polyamides are typified by the numerous varieties of nylon, though some, e.g., "Versamide," are quite different from nylon. See also nylon; polypeptide; protein; aramid.

polyamine-methylene resin. A polyethylene polyamine methylene substituted resin of diphenylol dimethylmethane and formaldehyde in basic form.

Properties: Light amber, granular, freely flowing powder with appreciable odor. Insoluble in dilute acids and alkalis, alcohol, ether, and water.

Use: Medicine; ion-exchange resin.

polyaminotriazole (PAT). A synthetic polymer made from sebacic acid and hydrazine with small amounts of acetamide. Polyoctamethylene-aminotriazole is a specific example.

See monobasic.

"Poly B-D" Liquid Resins.²²² Trademark for low molecular weight liquid polymers based on butadiene containing controlled hydroxyl functionality. They consist of both homo- and terpolymers. Designed for general rubber products, coatings, adhesives, etc.

polybenzimidazole (PBI) (C₇H₆N₂)_n. A synthetic polymer designed for high-temperature space technology applications. Reputed to withstand temperatures up to 500°F for 1000 hours.

Derivation: Condensation of diphenyl isophthalate and 3,3'-diaminobenzidine.

Uses: Fibers; composites; adhesives (high adhesion to steel, titanium, beryllium and aluminum alloys); coatings; ablative materials.

polyblend. A mixture in any proportion of either (1) two homopolymers (natural or synthetic), (2) a homopolymer and a copolymer, or (3) two copolymers. An example of (1) is rubber-polystyrene, of (2) is rubber and butadiene-styrene, and of (3) is a mixture of butadiene-acrylonitrile and isobutylene-isoprene. A polyblend is a mixture that is made after its components have been polymerized, and thus is different from a copolymer, which is made by chemical combination of two monomers. See also homopolymer; copolymer.

polybutadiene. A synthetic thermoplastic polymer made by polymerizing 1,3-butadiene (q.v.) with a stereospecific organometallic catalyst (butyl lithium), though other catalysts such as titanium tetrachloride and aluminum iodide may be used. The *cis*-isomer, which is similar to natural rubber, is used in tire treads due to its abrasion and crack resistance and low heat build-up. Large quantities are also used as blends in SBR rubber (q.v.). The *trans*-isomer resembles gutta percha and has limited utility. Liquid polybutadiene, which is sodium-catalyzed, has specific uses as a coating resin. It is cured with organic peroxides. Combustible; the liquid form is probably toxic by ingestion and inhalation, as well as a skin irritant. See also polymer, stereospecific.

polybutene (polybutylene; polyisobutylene; polyisobutene). Any of several thermoplastic isotactic (stereoregular) polymers of isobutene of varying molecular weight; also polymers of butene-1 and butene-2. Butyl rubber (q.v.) is a type of polyisobutene to which has been added about 2% of isoprene, which

provides sulfur linkage sites for vulcanization. Isobutene can be homopolymerized to various degrees in chains containing from 10 to 1000 units, the viscosity increasing with molecular weight. It is combustible and essentially nontoxic.

See also "Vistanex."

Uses: Lubricating-oil additive; hot-melt adhesives; sealing tapes; special sealants; cable insulation; polymer modifier; viscosity index improvers.

polybutylene terephthalate. An engineering plastic derived from 1,4-butanediol.

"Polycarbafil."⁵³⁹ Trademark for a glass fiber-reinforced polycarbonate (q.v.).

polycarbonate. A synthetic thermoplastic resin derived from bisphenol A and phosgene; a linear polyester of carbonic acid: (COOC₆H₄C(CH₃)₂C₆H₄O)_n. Can be formed from any dihydroxy compound and any carbonate diester, or by ester interchange. Polymerization may be in aqueous emulsion or in non-aqueous solution.

Properties: Transparent (90% light transmission); noncorrosive; weather and ozone-resistant; nontoxic; stain-resistant; combustible but self-extinguishing; low water absorption; high impact strength; heat-resistant; high dielectric strength; dimensionally stable; soluble in chlorinated hydrocarbons and attacked by strong alkalis and aromatic hydrocarbons; stable to mineral acids; insoluble in aliphatic alcohols. Excellent for all molding methods, extrusion, thermoforming etc.; easily fabricated by all methods including thermoforming and fluidized bed coating.

Uses: Molded products; solution-cast or extruded film; structural parts; tubes and piping; prosthetic devices; meter face plates; nonbreakable windows; street-light globes; household appliances; bicycles.

polycarboxylic acid. An organic acid containing two or more carboxyl (COOH) groups.

polychlor. General name for synthetic chlorinated hydrocarbons used as pesticides.

polychlorinated biphenyl (PCB). One of several aromatic compounds containing two benzene nuclei with two or more substituent chlorine atoms. They are colorless liquids with sp. gr. of 1.4 to 1.5. They are highly toxic. Their chief use is in heat-exchange and insulating fluids in closed systems. FDA has prohibited their use in plants manufacturing foods, animal feeds, and food-packaging materials, and has established strict tolerances on their presence in many food products (2.5 ppm).

Note: Because of their persistence and ecological damage from water pollution their manufacture has been discontinued in the U.S. (1976).

polychloroethylenesulfonyl chloride. See polyethylene, chlorosulfonated.

polychloroprene. See neoprene.

polychlorotrifluoroethylene (PCTFE). See chlorotrifluoroethylene resin.

"Polycin."²⁰² Trademark for (1) an elastic, tacky, gel-like solid resulting from the polymerization of castor oil; used in rubber compounding, floor tile manufacture and as a polymeric plasticizer; (2) a series of polyols used in the preparation and curing of urethane polymers for protective coatings, foamed insulation and elastomers.

"Polyclar."³⁰⁷ Trademark for a series of beverage grades of polyvinylpyrrolidone. Used as a clarifier; stabilizer for flavor and color.

"Polyco."⁶⁵ Trademark for a series of thermoplastic polymers in the form of water emulsions or solvent solutions; applied to vinyl acetate polymers and copolymers, butadiene-styrene copolymer latices, polystyrenes, vinyl and vinylidene chloride copolymers, acrylic copolymers, and water-soluble polyacrylates. Uses: Adhesives and coatings, in paint, leather, textiles, paper, cosmetics and construction fields.

polycondensation. See condensation (1); polymerization.

polycoumarone resin. See coumarone-indene resin.

"Polycryl."⁶⁵ Trademark for a series of acrylic polymers and copolymers polymerized in solvent medium and supplied as solutions in toluene, methyl ethyl ketone or other solvent.

polycyclic. An organic compound having four or more ring structures, which may be the same or different. See naphthacene; polynuclear.

poly(1-4-cyclohexylenedimethylene)terephthalate. A linear polyester film or fiber obtained by condensation of terephthalic acid with 1,4-cyclohexanedi-methanol. It has good electrical resistivity and hydrolytic stability. Used principally for carpet fibers and chemically resistant films. Trademarked "Kodel." See also terephthalic acid.

"Polycyclol 1222."²¹⁴ Trademark for an intermediate for the preparation of alkyd-type resins used for coatings. These are known by the coined name "cyclyd" (q.v.).

poly-1,1-dihydroperfluorobutyl acrylate.

Properties: White, rubber-like polymer; sp. gr. 1.5; begins to degrade at 300°F; retains strength and elastomeric properties in contact with synthetic lubricants, solvents, hydraulic fluids, oils, etc., at temperatures in the range of 300–400°F; has limited flexibility at sub-zero temperatures. Nonflammable.

Uses: O-rings, seals, gaskets, diaphragms, hose, sheets, and coating for fabric and other surfaces.

poly-para-dinitrosobenzene. See "Polyac."

"Polydril."²³³ Trademark for a synthetic water-soluble polymer; used as a flocculating agent in the oil industry.

polyelectrolyte. A high polymer substance, either natural (protein, gum arabic) or synthetic (polyethyleneimine, polyacrylic acid salts) containing ionic constituents; they may be either cationic or anionic. The former type is widely used for industrial applications. Water solutions of both types are electrically conducting; some are effective in concentrations as low as 1 ppm. In a given polyelectrolyte, ions of one sign are attached to the polymer chain, while those of opposite sign are free to diffuse into the solution. Major uses are flocculation of solids (especially dissolved phosphates) in potable water, dispersion of clays in oil well drilling muds, soil conditioning, antistatic agents, and treatment of paper-mill waste water. Ion-exchange resins (q.v.) are cross-linked (stabilized) polyelectrolytes.

See also flocculant; "Purifloc"; "Cat-Floc."

"Poly-Em" Emulsions.⁵³³ Trademark for a series of polyethylene emulsions, many of which are designed for polishes.

polyene. Any unsaturated aliphatic or alicyclic compound containing more than four carbon atoms in

the chain and having at least two double bonds. Examples are pentadiene, cyclooctatriene.

polyester fiber. Generic name for a manufactured fiber (either as staple or continuous filament) in which the fiber-forming substance is any long chain synthetic polymer composed of at least 85% by weight of an ester of a dihydric alcohol and terephthalic acid (Federal Trade Commission). See "Dacron"; polyethylene terephthalate.

Properties: Strength (staple), 2.2 to 4.0 g per denier; (continuous filament), up to 9.5 g per denier. M.p. 264°C; water absorption 0.5%. Nonflammable.

Uses: Tire fabric; seat belts; reinforcement of rubber hose for seawater cooling systems; as blend in clothing fabrics; fire-hose jackets.

polyester film. Continuously extruded polyester sheet of various thicknesses, especially useful in electrical equipment because of its high resistivity. Its tensile strength of 25,000 psi is much greater than that of other plastic films. Sensitized polyester film is used in magnetic tapes, in the photocopying technique known as reprography.

polyester resin. Any of a group of thermosetting synthetic resins, which are polycondensation products of dicarboxylic acids with dihydroxy alcohols. They are thus a special type of alkyd resin but, unlike other types, are not usually modified with fatty acids or drying oils. The outstanding characteristic of these resins is their ability, when catalyzed, to cure or harden at room temperature under little or no pressure. Most polyesters now produced contain ethylenic unsaturation, generally introduced by unsaturated acids. The unsaturated polyesters are usually cross-linked through their double bonds with a compatible monomer, also containing ethylenic unsaturation, and thus become thermosetting. Flame resistance is imparted by using either acid or glycol ingredients having a high content of halogens, e.g., HET acid.

The principal unsaturated acids used are maleic and fumaric. Saturated acids, usually phthalic and adipic, may also be included. The function of these acids is to reduce the amount of unsaturation in the final resin, making it tougher and more flexible. The acid anhydrides are often used if available and applicable. The dihydroxy alcohols most generally used are ethylene, propylene, diethylene, and dipropylene glycols. Styrene and diallyl phthalate are the most common cross-linking agents. Polyesters are resistant to corrosion, chemicals, solvents, etc.

Forms: Sheets; powder; chips.

Uses: Reinforced plastics; automotive parts; boat hulls; foams; encapsulation of electrical equipment; protective coatings; ducts, flues, and other structural applications; low-pressure laminates; magnetic tapes; piping; bottles.

See also alkyd resin; "Dacron"; "Mylar."

polyethenoid. Characterizing an aliphatic compound having more than one ethene group $-\text{CH}=\text{CH}-$. Linoleic acid is a polyethenoid fatty acid.

polyether. A polymer in which the repeating unit contains a carbon-oxygen bond derived from aldehydes or epoxides or similar materials. Examples are "Delrin" and "Celcon."

polyether, chlorinated. A highly crystalline material that is 46% chlorine. Outstanding corrosion-resistance. Good electrical resistance. Readily prepared and fabricated.

Uses: Fluid-bed coating; tank linings; piping; valves; laboratory equipment; chemical processing equipment.

polyether foam. A polyurethane foam, either rigid or flexible, made by use of a polyether as distinct from a polyester or other resin component.

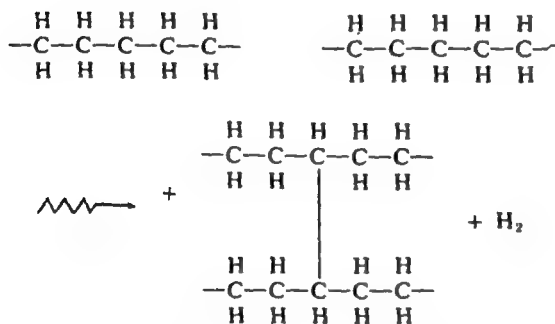

Hazard: See polyurethane.

polyether glycol. A compound with a structure skeleton such as HO-C-C-O-C-C-O-C-C-O-C-C-OH. The length of the chain can vary widely, and the number of consecutive carbon atoms may be greater than two. Examples are polyethylene glycol and polypropylene glycol.

polyethylene ($H_2C:CH_2$), chlorosulfonated. See "Hypalon." cross-linked (XLPE).

Properties: Thermosetting white solid; high temperature-resistant; excellent resistance to chemicals and to creep; high impact and tensile strength; high electrical resistivity; insoluble in organic solvents; does not stress-crack. Combustible. Nontoxic.

Derivation: (a) By irradiating linear polyethylene with electron beam or gamma radiation; cross-linking taking place through a primary valence bond, as shown:

(b) By chemical cross-linking agent such as an organic peroxide (e.g., benzoyl peroxide). All grades of polyethylene and most copolymers can be chemically cross-linked.

Uses: Wire and cable coatings and insulation (low-density grades); pipe and molded fittings (high-density grades). Special types having low electrical resistivity can be made; these can be regarded as semiconductors.

Note: In molding cross-linked polyethylene, the desired part must be formed before cross-linking is initiated, as material will not change its shape after cross-linking. Cross-linked polyethylene is a relatively new type of material, unlike other thermosets and thermoplastics. The variations in composition and wide range of properties approach the ideal of a universal material more closely than most polymers.

linear (low- and high-density).

Properties: Thermoplastic white solid; molecular weight 6000 or more; high neutron absorption capacity; excellent barrier to water vapor and moisture; combustible; nontoxic.

Low-density: Sp. gr. 0.915; tensile strength 1500 psi; impact strength over 10 ft-lb/in./notch; thermal expansion 17×10^{-3} in./in./°C. Resistant to solvents and corrosive solutions; attacked by surfactants.

High-density: Sp. gr. 0.95; tensile strength 4000 psi; impact strength 8 ft-lb/in./notch; good electrical resistivity. Film is gas-permeable and hydrophobic; does not resist nitric acid.

Derivation: By polymerization of ethylene (a) with peroxide catalyst (amorphous); (b) by metal alkyl catalysts in a hydrocarbon solvent (crystalline). (See "Marlex"). Method (a) can be used at pressures as low as 500 to 600 psi; conventional pressures are 15,000 to 30,000 psi.

Forms: Rods, bars, sheets, tubes; thin films; molding powders; fibers.

Containers: Drums; hopper cars.

Hazard: Film is combustible and tends to disintegrate into burning globules.

Uses (high-density): Blow-molded products; injection-molded items; film and sheet; piping; gasoline and oil containers. (Low-density): packaging film, especially for food products; paper coating; liners for drums and other shipping containers; wire and cable coating; toys; cordage; refuse and waste bags; chewing-gum base; squeeze bottles; shipping drums; electrical insulation.

Note: Ethylene may be copolymerized with varying percentages of other materials, e.g., 2-butene or acrylic acid; a crystalline product results from copolymerization of ethylene and propylene. When butadiene is added to the copolymer blend, a vulcanizable elastomer is obtained. See also polyethylene, cross-linked.

low molecular weight.

Properties: Molecular weight from 2000 to 5000.

Translucent white solids; excellent electrical resistance; abrasion-resistant; resistant to water and most chemicals; sp. gr. 0.92; slightly soluble in turpentine, petroleum naphtha, xylene, and toluene at room temperature; soluble in xylene, toluene, trichloroethylene, turpentine, and mineral oils at 180°F; practically insoluble in water; slightly soluble in methyl acetate, acetone, and ethanol up to the boiling point of these solvents. Available as emulsified and nonemulsified forms. Combustible.

Uses: Mold-release agent for rubber and plastics; paper and container coatings; liquid polishes and textile finishing agents.

polyethylene glycol (PEG; also called polyoxyethylene, polyglycol, or polyether glycol, q.v.). Any of several condensation polymers of ethylene glycol with the general formula $HOCH_2(CH_2OCH_2)_nCH_2OH$ or $H(OCH_2CH_2)_nOH$. Average molecular weights range from about 200 to 6000. Properties vary with molecular weight.

Properties: Clear, colorless, odorless, viscous liquids to waxy solids; soluble or miscible with water and for the most part with alcohol and other organic solvents; heat-stable; inert to many chemical agents; do not hydrolyze or deteriorate; have low vapor pressure. Combustible; nontoxic.

Derivation: By condensation of ethylene glycol, or of ethylene oxide and water.

Uses: Chemical intermediates (lower molecular weight varieties); plasticizers; softeners and humectants; lubricants; bases for cosmetics and pharmaceuticals; solvents; binders; metal and rubber processing; permissible additives to foods and animal feed; laboratory reagent. See also "Carbowax."

polyethylene glycol chloride $H(OCH_2CH_2)_nCl$. Any of a group of polymers, usually colorless liquids with very low vapor pressures at room temperature. Mo-

lular weights from about 100 to about 600. Miscible with water; sp. gr. (20°C) for a low molecular weight polymer is 1.18, for a high molecular weight polymer 1.14. The former sets to a glass at -90°C, the latter sets to a wax-like solid at 20°C. Used as solvents for cleaning, extracting, and dewaxing. Combustible.

polyethylene glycol ester. A mono- or di- ester resulting from the interaction of an organic acid with one or both of the glycol ends of the polyethylene glycol polymer. These are also called polyoxyethylene esters, polyglycol esters, or by a coined generic name.

polyethyleneimine ($\text{CH}_2\text{CH}_2\text{NH}$)_x. Highly viscous hygroscopic liquid when anhydrous; completely miscible with water and lower alcohols; insoluble in benzene. Reactive toward cellulose. Combustible.

Uses: Adhesive and anchoring agent for paper and cellophane; dewatering agent and wet strength improver in paper manufacture; fixative; levelling agent in textile fibers; antiblocking agent on plastic films; flocculating agent; ion exchange resins; complexing agents; disinfectant for textiles, skins; photographic chemistry; absorbent for carbon dioxide; water purification; polyelectrolyte.

polyethylene oxide. A plastic reported to be dimensionally stable at high and low temperatures and designed as a substitute for phenolics.

polyethylene oxide sorbitan fatty acid esters. See polysorbate.

polyethylene terephthalate. A polyester formed from ethylene glycol by direct esterification or by catalyzed ester exchange between ethylene glycol and dimethyl terephthalate. Offered as oriented film or fiber. It melts at 265°C; tenacity is 2.2 to 4 g/denier (staple) and up to 9.0 g/denier as continuous filament. It has good electrical resistance and low moisture absorption. Resists combustion and is self-extinguishing.

Uses: Blended with cotton, for wash-and-wear fabrics; blended with wool, for worsteds and suitings; packaging films; recording tapes; soft-drink bottles. See also "Dacron"; "Terylene"; "Mylar"; "Dalar."

polyethylene thiuram sulfide.

Derivation: Oxidation of diammonium ethylene bisdithiocarbamate with calcium hypochlorite.

Grades: 50% vegetable powder; 95% technical powder. Containers: 50-lb multiwall paper bags.

Hazard: May be toxic.

Use: Fungicide.

"Poly-FBA."¹⁵⁸ Trademark for poly-1,1-dihydroperfluorobutyl acrylate (q.v.).

"Polyfilm."²³³ Trademark for virgin polyethylene film specially formulated for converting and packaging.

"Polyflo."⁴¹⁶ Trademark for a series of all-organic inhibitor-dispersants designed for treatment of all fuel and diesel oils. Depending on precise inhibitor needs, this series contains products (1) to improve jet fuel thermal stability, (2) to stabilize No. 2 heating oils and diesel fuels against color deterioration and sludge deposition, (3) to eliminate fouling in feed exchangers and reboilers, (4) to eliminate tank bottoms in crude and residual oil storage tanks. Each member of the series exhibits a different degree of effectiveness in different types of stocks.

"Polyfon."²²⁸ Trademark for a sodium lignosulfonate produced from pure, sugar-free, alkali lignin.

Properties: Nonhygroscopic, free-flowing brown amorphous powder. Completely free of wood sugars, hemicelluloses or other degradation products. Soluble in cold water. Yields alkaline solution.

Uses: Dispersant; thinner; plasticizer; binder; grinding aid; anticaking agent; protective colloid.

polyformaldehyde. See paraformaldehyde.

polyformaldehyde resin. See acetal resin.

"Poly-G."⁸⁴ Trademark for a series of polyethylene glycols, polypropylene glycols and polyoxypropylene adducts of glycerol.

G200, 300, 400, and 600 are liquid polyethylene glycols; G1000, 1500, GB-1530 and BG-2000 are waxy polyethylene glycols. The number indicates the approximate molecular weight.

G420P, 1020P, 2020P are propylene oxide condensation polymers of propylene glycol.

G1030PG, 3030PG, 4030PG are propylene oxide condensation polymers of glycerol.

"Polygard."²⁴⁸ Trademark for a mixture of alkylated aryl phosphites.

Properties: Liquid; clear amber; sp. gr. 0.99; soluble in acetone, alcohol, benzene, carbon tetrachloride, solvent naphtha and ligroin; insoluble in water but can hydrolyze.

Use: Nondiscoloring stabilizer for rubber and plastics.

polyglycerol. One of several mixtures of ethers of glycerol with itself, ranging from diglycerol to triacontaglycerol. Some examples are: (a) diglycerol, possibly $(\text{CH}_2\text{OHCHOHCH}_2)_2\text{O}$, molecular weight 166, a liquid with 4 OH groups, viscosity of 287 cs at 150°F; (b) hexaglycerol, mol. wt. 462, a liquid with 8 OH groups, viscosity 1671 cs at 150°F; (c) decaglycerol, mol. wt. 758, a liquid with 12 OH groups, viscosity 3199 cs.

Properties: Viscous liquids to solids; soluble in water, alcohol, and other polar solvents. Act as humectants much like glycerin but have progressively higher molecular weights and boiling points. Combustible; low toxicity.

Derivation: Glycerol is heated with an alkaline catalyst (200-275°C) at normal or reduced pressure. A stream of inert gas may be used to blanket the reaction and help remove the water of reaction.

Uses: Surface-active agents, emulsifiers, plasticizers, adhesives, lubricants, and other compounds used for both edible and industrial applications.

polyglycerol ester. One of several partial or complete esters of saturated and unsaturated fatty acids with a variety of derivatives of polyglycerols ranging from diglycerol to triacontaglycerol. Prepared by (a) direct esterification and (b) transesterification reactions. Combustible; low toxicity.

Some examples of (a): decaglycerol monostearate, semisolid, sp. gr. 1.04; m.p. 51.9°C; decaglycerol monooleate, viscous liquid; sp. gr. 1.13, m.p. below zero; decaglycerol hexaoleate, liquid, sp. gr. 0.97, m.p. below zero.

Examples of (b): triglycerol monolinoleate, viscosity 322 cp (168°F) and triglycerol trilinoleate, viscosity 30.1 cp (168°F).

Uses: Lubricants, plasticizers, paint and varnish vehicles, gelling agents, urethane intermediates, adhesives, crosslinking agents, humectants, textile fiber finishes, functional fluids, surface-active agents, dis-

persants and emulsifiers in foods, pharmaceuticals, cosmetic preparations.

polyglycol. See polyethylene glycol.

polyglycol amine H-163 $\text{HO}[\text{C}_2\text{H}_4\text{O}]_x\text{C}_2\text{H}_4\text{NH}_2$.

Properties: Colorless liquid; sp. gr. 1.0556; b.p., decomposes; f.p. 14.5°C ; soluble in water; wt/gal 8.8 lb; flash point 295°F . Combustible; low toxicity. Containers: Drums.

polyglycol distearate (polyethylene glycol distearate) $\text{C}_{17}\text{H}_{35}\text{COO}(\text{CH}_2\text{CH}_2\text{O})_x\text{OCC}_{17}\text{H}_{35}$. Distearate ester of polyglycol.

Properties: A soft, off-white solid; sp. gr. 1.04 (50°C); m.p. 43°C ; pH of 10% dispersion 7.26; saponification number variable; soluble in chlorinated solvents, light esters and acetone. Slightly soluble in alcohols; insoluble in glycols, hydrocarbons and vegetable oils. Combustible; low toxicity.

Uses: Plasticizer for various resins; component of grinding and polishing pastes to promote easy removal in water.

polyglycol. See polyethylene glycol ester.

"Polygriptex." Trademark for an adhesive especially designed for bonding polyethylene sheeting to porous surfaces; used in making polyethylene-lined bags and multiwall kraft bags. Has good adhesion to waxed surfaces. Available in viscosities from 300 to 20,000 centipoises.

polyhalite $2\text{CaSO}_4 \cdot \text{MgSO}_4 \cdot \text{K}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$. A naturally occurring potash salt found in Germany, Texas, and New Mexico.

Use: Source of potash for fertilizer.

polyhexamethylenedipamide. Same as nylon 66.

polyhexamethylene sebacamide. Same as nylon 610.

polyhydric alcohol. See polyol.

polyimide. Any of a group of high polymers which have an imide group ($-\text{CONHCO}-$) in the polymer chain.

Properties: Specific gravity 1.42, tensile strength 13,500 psi, water absorption (24 hrs at 77°K) 0.3%, heat distortion point above 500°F , dielectric constant at 2000 m.c. 3.2, and coefficient of linear expansion 28.4×10^{-6} in./in./ $^\circ\text{F}$. High-temperature stability (up to 700°F); excellent frictional characteristics; good wear resistance at high temperatures; resists radiation; exhibits low outgassing in high vacuum; resistant to organic materials at quite high temperatures; not resistant to strong alkalies and to long exposure to steam. Flame retardant.

Uses: High-temperature coatings; laminates and composites for aerospace vehicles; ablative materials, oil sealants and retainers, adhesives, semiconductors, valve seats, bearings; insulation for cables, printed circuits, magnetic tapes (high- and low-temperature-resistant); flame-resistant fibers; binders in abrasive wheels.

polyindene resin. See coumarone-indene resin.

"Poly-Ionic."³⁰⁰ Trademark for a series of polyethylene emulsions. Used as softeners and lubricating agents for textiles.

polyisobutene. See polybutene.

polyisobutylene. See polybutene.

polyisocyanurate. See isocyanurate.

polyisoprene. $(\text{C}_5\text{H}_8)_n$. The major component of natural rubber; also made synthetically. Forms are stereo-

specific *cis*-1,4-, and *trans*-1,4-polyisoprene. Both can be produced synthetically by the effect of heat and pressure on isoprene in the presence of stereospecific catalysts. (See catalyst, stereospecific). Natural rubber is *cis*-1,4-; synthetic *cis*-1,4- is sometimes called synthetic natural rubber. *Trans*-1,4-polyisoprene resembles gutta-percha. Polyisoprene is thermoplastic until mixed with sulfur and vulcanized. Supports combustion; nontoxic. For further information on properties and uses, see rubber, natural and synthetic.

"Polylan."⁴⁹³ Trademark for a polyunsaturated ester of linoleic acid and lanolin alcohols. An amber, viscous oily liquid; soluble in mineral oil; castor oil; anhydrous ethanol, isopropanol, ethyl acetate; insoluble in water. Used as a hydrophobic conditioner in cosmetics and pharmaceuticals.

"Poly-Lease."¹⁷⁵ Trademark for an aerosol mold release and parting agent for plastics and rubber materials, based on a low molecular weight polyethylene lubricant. The usual precautions for shipping and handling aerosol containers apply.

"Polylite."³⁶ Trademark for a group of 100% reactive alkyd resins, dissolved in styrene and other monomers. Highly diversified applications both alone and in combination with such materials as fibrous glass. This group also includes resins for use with diisocyanate to form rigid or flexible polyurethane foams.

"Polylite."²⁴⁸ Trademark for nonylated diphenyl amine.

"Polymax."³³² Trademark for woven fabrics of polyolefin fibers for liquid and pneumatic filtration.

"Polymeg."²²⁴ Trademark for polytetramethylene ether glycols. Available in three molecular weight ranges: 1000, 2000 and 3000.

Properties: Waxy solids which melt to clear, viscous liquids at about 100°F . On supercooling (or nucleation) the liquid resolidifies. Sp. gr. 0.985 (1000 MW) to 0.982 (3000 MW) at 95°F ; soluble in aromatic and chlorinated hydrocarbons; slightly soluble in water, solubility decreasing with increasing molecular weight.

Use: Polyurethane technology.

polymer. A macromolecule formed by the chemical union of 5 or more identical combining units called monomers. In most cases the number of monomers is quite large (3500 for pure cellulose), and often is not precisely known. In synthetic polymers this number can be controlled to a predetermined extent, e.g., by shortstopping agents. (Combinations of 2, 3, or 4 monomers are called, respectively, dimers, trimers, and tetramers, and are known collectively as oligomers). A partial list of polymers by type is as follows:

- I. Inorganic
 - siloxane; sulfur chains; black phosphorus; boron-nitrogen; silicones.
- II. Organic
 1. Natural
 - (a) Polysaccharides
 - starch; cellulose; pectin; seaweed gums (agar, etc.); vegetable gums (arabic, etc.)
 - (b) Polypeptides (proteins)
 - casein; albumin; globulin; keratin; insulin; DNA
 - (c) Hydrocarbons
 - rubber (polyisoprene); gutta percha; balata.
 2. Synthetic
 - (a) Thermoplastic elastomers (unvulcanized); nylon; polyvinyl

chloride; polyethylene (linear); polystyrene; polypropylene; fluorocarbon resins; polyurethane; acrylate resins

(b) Thermosetting elastomers (vulcanized); polyethylene (crosslinked); phenolics; alkyds; polyesters

3. Semisynthetic cellulosics (rayon, methylcellulose, cellulose acetate); modified starches (starch acetate, etc.)

See also following entries.

polymer, addition. See addition polymer.

polymerase. An enzyme which catalyzes the formation of messenger DNA.

polymer, atactic. See atactic.

polymer, block. See block polymer.

polymer, condensation. A polymer formed by a condensation reaction (q.v.).

polymer, electroconductive. A polymer or elastomer made electrically conductive by incorporation of a substantial percentage of a suitable metal powder (e.g., aluminum) or acetylene carbon black; the proportion used must be high enough to permit the particles to be in contact with one another in the mixture. Polyelectrolytes such as ion-exchange resins, salts of polyacrylic acid and sulfonated polystyrene are electroconductive in the presence of water. Pyrolysis of polyacrylonitrile makes it electrically conductive without impairment of its structure.

polymer, graft. See graft polymer.

polymer, high. An organic macromolecule composed of a large number of monomers. The molecular weight may range from about 5000 into the millions (for some polypeptides). Natural high polymers are exemplified by cellulose ($C_6H_{10}O_5$)_n and rubber (C_5H_8)_n. Proteins are natural high polymer combinations of amino acid monomers. The dividing line between low and high polymers is considered to be in the neighborhood of 5000 to 6000 molecular weight.

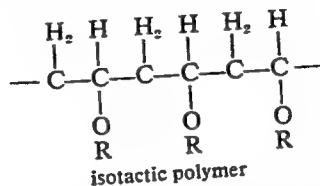

Synthetic high polymers (or "synthetic resins") include a wide variety of materials having properties ranging from hard and brittle to soft and elastic. Addition of such modifying agents as fillers, colorants, etc., yields an almost infinite number of products collectively called plastics (q.v.). High polymers are the primary constituents of synthetic fibers, coating materials (paints and varnishes), adhesives, sealants, etc. Polymers having special elastic properties are called rubbers, or elastomers (q.v.).

Synthetic polymers in general can be classified: (1) by thermal behavior, i.e., thermoplastic and thermosetting (q.v.); (2) by chemical nature, i.e., amino, alkyd, acrylic, vinyl, phenolic, cellulosic, epoxy, urethane, siloxane, etc., and (3) by molecular structure, i.e., atactic, stereospecific, linear, cross-linked, block, graft, ladder, etc. (see specific entries). Copolymers (q.v.) are products made by combining two or more polymers in one reaction (styrene-butadiene). See also cross-linking.

polymer, inorganic. A polymer in which the main chain contains no carbon atoms and in which behavior similar to that of an organic polymer can be developed, i.e., covalent bonding and cross-linking, as in silicone polymers. Here the element silicon replaces carbon in the straight chain; substituent groups are often present, forming highly useful poly-

mers. Other inorganic high polymers are black phosphorus, boron and sulfur, all of which can form polymeric structures under special conditions. At present these have little or no commercial significance.

polymer, isotactic. A type of polymer structure in which groups of atoms which are not part of the backbone structure are located either all above or all below the atoms in the backbone chain, when the latter are all in one plane. See polymer, stereospecific.

polymerization. A chemical reaction, usually carried out with a catalyst, heat or light, and often under high pressure, in which a large number of relatively simple molecules combine to form a chain-like macromolecule.

The polymerization reaction occurs spontaneously in nature; industrially it is performed by subjecting unsaturated or otherwise reactive substances to conditions that will bring about combination. This may occur by *addition*, in which free radicals are the initiating agents that react with the double bond of the monomer by adding to it on one side, at the same time producing a new free electron on the other:

By this mechanism the chain becomes self-propagating. Polymerization may also occur by condensation, involving the splitting out of water molecules by two reacting monomers, and by so-called oxidative coupling (q.v.). The degree of polymerization (D.P.) is the number of monomer units in an average polymer unit of a given sample.

Polymerization techniques may be: (1) in the gas phase at high pressures and temperatures (200°C); (2) in solution at normal pressure and temperatures from -70° to +70°C; (3) bulk or batch polymerization at normal pressure at 150°C; (4) in suspension at normal pressure at 60° to 80°C; (5) in emulsion form at normal pressure at -20° to +60°C (used for copolymers). Catalysts of the peroxide type are necessary with some of these methods.

See also polymer, stereospecific; free radical.

polymer, ladder. See ladder polymer.

polymer, low. A polymer comprised of comparatively few monomer units and having a molecular weight from about 300 to 5000.

polymer, natural. See polymer.

polymer, stereoblock. See stereoblock polymer.

polymer, stereospecific (stereoregular). A polymer whose molecular structure has a definite spatial arrangement, i.e., a fixed position in geometrical space for the constituent atoms and atomic groups comprising the molecular chain, rather than the random and varying arrangement that characterizes an amorphous polymer. Achievement of this specific steric (three-dimensional) structure (also called tacticity, q.v.) requires use of special catalysts such as those developed by Ziegler and Natta (q.v.) about 1950

Such polymers are wholly or partially crystalline. Synthetic natural rubber, cis-polyisoprene, is an example of a stereospecific polymer made possible by this means. There are five types of stereospecific (or stereoregular) structures; cis, trans, isotactic, syndiotactic, and tritactic. See also catalyst, stereospecific.

polymer, syndiotactic. See syndiotactic polymer.

polymer, synthetic. See polymer.

polymer, water-soluble. Any substance of high molecular weight that swells or dissolves in water at normal temperature. These fall into several groups, including natural, semisynthetic, and synthetic products. Their common property of water solubility makes them valuable for a wide variety of applications as thickeners, adhesives, coatings, food additives, textile sizing, etc. For further details see specific entries.

(1) *Natural.* This type is principally comprised of gums (q.v.), which are complex carbohydrates of the sugar group. They occur as exudations of hardened sap on the bark of various tropical species of trees. All are strongly hydrophilic. Examples are arabic, tragacanth, karaya, etc.

(2) *Semisynthetic.* This group (sometimes called water-soluble resins) includes such chemically treated natural polymers as carboxymethylcellulose, methylcellulose and other cellulose ethers, as well as various kinds of modified starches (ethers and acetates).

(3) *Synthetic.* The principal members of this class are polyvinyl alcohol (q.v.), ethylene oxide polymers, polyvinyl pyrrolidone, polyethyleneimine, etc.

polymethacrylate resin. See acrylic resin.

polymethylbenzene. See durene and pseudocumene, the two members of this group with some commercial production and use.

polymethylene polyphenol. See "Tetra-Flex."

polymethylene polyphenylisocyanate. A polymer of diphenylmethane 4,4'-diisocyanate (q.v.).

polymethylene wax. See wax, polymethylene.

poly-4-methylpentene-1.

Properties: High resistance to all chemicals except carbon tetrachloride and cyclohexane. Excellent heat resistance; high clarity and light transmittance. Temperature limit 170°C. Sp. gr. 0.83.

Uses: Laboratory ware (beakers, graduates, etc.); electronic and hospital equipment; food packaging, especially types subject to high temperature such as trays for TV dinners, etc.; light reflectors.

poly(methyl vinyl ether). See polyvinyl methyl ether.

polymorphism. See allotropy.

"Polymul MS-40."³⁰⁹ Trademark for a polyethylene-wax dispersion for fabric finishing. Contains non-oxidized grade of polyethylene which is odor-free.

polymyxin. Generic term for a series of antibiotic substances produced by strains of *Bacillus polymyxa*. Various polymyxins are differentiated by the letters A, B, C, D and E. All are active against certain gram-negative bacteria. Polymyxin B (q.v.) is most used.

Properties: All are basic polypeptides, soluble in water; the hydrochlorides are soluble in water and methanol; insoluble in ether, acetone, chlorinated solvents and hydrocarbons. Permissible food additives. Toxicity low or negligible.

Uses: Medicine (antibiotic); beer production.

polynuclear. Descriptive of an aromatic compound containing four or more closed rings, usually of the benzenoid type. See also polycyclic; nucleus (3).

"Polynycel."³⁰⁹ Trademark for aromatic amino condensates. Used as leveling agents for dye retardants for textiles, union dyeing of wool and nylon.

polyolefin. A class or group name for thermoplastic polymers derived from simple olefins (q.v.); among the more important are polyethylene, polypropylene, polybutenes, polyisoprene, and their co-polymers. Many are produced in the form of fibers. This group comprises the largest tonnage of all thermoplastics produced.

polyol. A polyhydric alcohol, i.e., one containing three or more hydroxyl groups. Those having three OH groups (trihydric) are glycerols; those with more than three are called sugar alcohols, with general formula $\text{CH}_2\text{OH}(\text{CHOH})_n\text{CH}_2\text{OH}$, where n may be from 2 to 5. These react with aldehydes and ketones to form acetals and ketals. See also alcohol; glycerol.

polyorganosilicate graft polymer. An organoclay to which a monomer or an active polymer has been chemically bonded, often by the use of ionizing radiation. An example is the bonding of styrene to a polysilicate containing vinyl radicals, resulting in the growth of polystyrene chains from the surface of the silicate. Such complexes are stable to organic solvents. They have considerable use potential in the ion-exchange field, as ablative agents, reinforcing agents and hydraulic fluids.

See also: organoclay; graft polymer.

"Polyotic."⁵⁷ Trademark for tetracycline (q.v.).

"Polyox."²¹⁴ Trademark for a series of water-soluble ethylene oxide polymers with molecular weights in the 100,000 to several million range.

Uses: Textile warp size, paper coatings, detergents, hair spray, toothpastes, water-soluble packaging film, adhesives.

polyoxadiazole. A polymer of oxadiazole, cyclic $\text{C}_2\text{N}_2\text{O}$, prepared by cyclodehydration (ring formation from a chain with subsequent loss of water) of polyisophthalic hydrazide. Because of its high temperature tolerance (above 750°F) fibers made from it may be useful for space vehicles.

polyoxamide. A nylon-type material made from oxalic acid and diamines.

polyoxetane. See oxetane; "Penton."

polyoxyethylene. See polyethylene glycol.

polyoxyethyleneoxypropylene (POEOP). A polymer of ethylene and propylene glycols (ethylene oxidepropylene oxide). Used as a solvent.

polyoxyethylene fatty acid ester. See polysorbate.

polyoxyethylene (20) sorbitan monolaurate. See polysorbate.

polyoxyethylene (2) sorbitan monooleate. See polysorbate.

polyoxyethylene (20) sorbitan monostearate. See polysorbate.

polyoxyethylene (20) sorbitan tristearate. See polysorbate.

polyoxyethylene (8) stearate. A mixture of the mono- and diesters of stearic acid and mixed polyoxyethyl-

ene diols having an average polymer length of about 7.5 oxyethylene units.

Properties: Cream-colored, soft, waxy or pasty solid at 25°C; faint, fatty odor and a slightly bitter, fatty taste. Soluble in toluene, acetone, ether, and ethanol. Nontoxic.

Use: Emulsifier in bakery products.

polyoxyethylene (40) monostearate (polyethylene glycol stearate). A mixture of the mono- and distearate esters of mixed polyoxyethylene diols and corresponding free glycols. The monostearate can be represented as: $H(OCH_2CH_2)_nOCOC_{17}H_{35}$ (n is approximately 40).

Properties: Waxy, light tan, nearly odorless solid; congealing range 39–45°C; soluble in water, alcohol, ether, and acetone; insoluble in mineral oil and vegetable oils. Nontoxic.

Grade: U.S.P.

Uses: Ointments; emulsifier; surfactant; food additive.

polyoxymethylene. Any of several polymers of formaldehyde and trioxane. See acetal resin.

polyoxypropylene diamine (POPDA). Any of six high molecular weight amines of low viscosity and vapor pressure, high primary amine content, and light color. Used as cross-linking agents in epoxy coatings, imparting high flexibility and adhesion at low temperatures. Other possible uses are in polyamide and polyurethane coatings, adhesives, elastomers and foams, as intermediates for textile and paper treatment, and viscosity index improvers in lube oils.

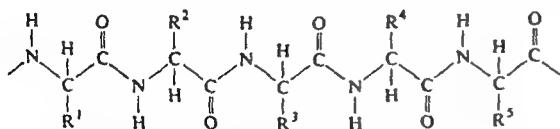

polyoxypropylene ester. See polypropylene glycol ester.

polyoxypropylene-glycerol adduct. One of several condensation polymers of propylene oxide and glycerol, with molecular weights in the range 1000 to 4000. Clear, stable, almost colorless, noncorrosive liquids. Uses similar to those of polypropylene glycol (q.v.).

"Poly-pale."²⁶⁶ Trademark for pale, hard, thermoplastic resins; 40% dimeric resin acids; acid number 145; USDA color WG; softening point 102°C. Available in solid and flake forms.

Uses: Adhesives, lacquers, varnishes, printing inks.

polypeptide (peptide). The class of compounds composed of acid units chemically bound together with amide linkages (CONH) with elimination of water. A polypeptide is thus a polymer of amino acids, forming chains that may consist of several thousand amino acid residues. A segment of such a chain is as follows:

The sequence of amino acids in the chain is of critical importance in the biological functioning of the protein, and its determination is one of the most difficult problems in molecular biology. The chains may be relatively straight, or they may be coiled or helical. In the case of certain types of polypeptides, such as the keratins, they are cross-linked by the disulfide bonds of cystine. Linear polypeptides can be regarded as proteins. See also protein; polyamide; keratin.

polyphenylene oxide. See "PPO."

polyphenylene triazole [$-C_6H_4-C_2N_3(C_6H_5)-$]_n. A polymer stated to be serviceable up to 500°F for films, coatings, adhesives, and lamination.

"Polyphos."⁸⁴ Trademark for a water-soluble glassy sodium phosphate of standardized composition, $(Na_{12}P_{10}O_{31})$ analyzing 63.5% P_2O_5 (ratio of $Na_2O:P_2O_5$ is 1.2:1). It is closely similar to a sodium hexametaphosphate and sodium tetraphosphate; frequently the three names are used interchangeably.

Grades: Ground; walnut-size to pea-size lumps.

Containers: 100-lb bags; 100-, and 350-lb drums.

Uses: Boiler water compounds; detergents; textiles; leather tanning; photographic film developing; deflocculation of clays; flotation and desliming of minerals; dispersion of pigments; paper processing; industrial and municipal water treatment.

polyphosphazene. See phosphazene.

polyphosphoric acid $H_{n+2}P_nO_{3n+1}$, for $n > 1$. Any of a series of strong acids, from pyrophosphoric acid, $H_4P_2O_7$ ($n = 2$), through metaphosphoric acid (large values of n).

Properties: Viscous, water-white liquid; water-soluble; does not crystallize on standing. Hygroscopic. The commercial acid is a mixture of orthophosphoric acid with pyrophosphoric, triphosphoric and higher acids and is sold on the basis of its calculated content of H_3PO_4 , as, for example 115%. Superphosphoric acid is a similar mixture sold at 105% H_3PO_4 . These acids revert slowly to orthophosphoric acid on dilution with water.

Hazard: Moderately toxic by ingestion; strong irritant.

Uses: Dehydrating, catalytic and sequestering agents; for metal treating; many applications where a concentrated monoxidizing acid is needed; laboratory reagent.

See also phosphoric acid.

polypropylene $(C_3H_5)_n$. A synthetic crystalline thermoplastic polymer, with molecular weight of 40,000 or more. Note: low molecular weight polymers are also known which are amorphous in structure, and used as gasoline additives, detergent intermediates, greases, sealants, and lube oil additives; also available as a high-melting wax.

Derivation: Polymerization of propylene with a stereospecific catalyst (q.v.) such as aluminum alkyl.

Properties: Translucent white solid; specific gravity 0.90; m.p. 168–171°C; tensile strength 5000 psi; flexural strength 7000 psi; usable up to 250°F. Insoluble in cold organic solvents; softened by hot solvents. Maintains strength after repeated flexing. Degraded by heat and light unless protected by antioxidants. Readily colored; good electrical resistance; low water absorption and moisture permeability; poor impact strength below 15°F; not attacked by fungi or bacteria; resists strong acids and alkalis up to 140°F; but is attacked by chlorine, fuming nitric acid, and other strong oxidizing agents. Combustible, but slow-burning. Nontoxic. Fair abrasion and good heat resistance if properly modified. Can be chrome-plated, injection- and blow-molded, and extruded.

Forms: Molding powder; extruded sheet; cast film (1 to 10 mils); textile staple and continuous filament yarn; fibers with diameters from 0.05 to 1 micron and fiber webs down to 2 microns thick; low-density foam.

Uses: Packaging film; molded parts for automobiles, appliances, housewares, etc.; wire and cable coating;

food container closures; coated and laminated products; bottles (with PVC); printing plates; fibers for carpets and upholstery; cordage and bristles; storage battery cases; crates for soft-drink bottles; laboratory ware; toys; synthetic seaweed to encourage silt deposition; radiator grills; trays and containers for storing precision equipment; artificial grass and turfs; plastic pipe; wearing apparel (acid-dyed); fish nets; surgical casts; strapping; synthetic paper; reinforced plastics.

polypropylenebenzene. See dodecylbenzene.

polypropylene, chlorinated. White, odorless, nonflammable powder. A film-forming polymer used in coatings, inks, adhesives and paper coatings.

polypropylene glycol ester. Exactly analogous to polyethylene glycol ester (q.v.).

polypropylene glycol monobutyl ether. See butoxy polypropylene glycol.

polypropylene glycol (PG). $\text{HO}(\text{C}_3\text{H}_6\text{O})_n\text{H}$. One of a group of compounds comparable to polyethylene glycols (q.v.), but more oil-soluble and substantially less water-soluble. Classified by approximate molecular weight, as 425, 1025, and 2025. Non-volatile, noncorrosive liquids; lower molecular weight members are soluble in water. Solvents for vegetable oils, waxes, resins. Combustible; low toxicity.

Uses: Hydraulic fluids; rubber lubricants; antifoam agents; intermediates in urethane foams, adhesives, coatings, elastomers; plasticizers; paint formulations; laboratory reagent.

polypropyleneimine. Polymeric form of propyleneimine (q.v.). Available in 50% aqueous solution.

Uses: Textile paper, and rubber industries.

polypropylene oxide ($\text{C}_3\text{H}_6\text{O}$)_n. A derivative of propylene used as intermediate for urethane foams.

polypyrrolidone. Synonym for nylon-4.

"Polyrad."²⁶ Trademark for reaction products of "Amine D" and ethylene oxide.

Grades: Various grades which differ in chain length of polyoxyethylene units and free amine content. Vary in viscosity at 25°C from 0.5 to 24.8 poises.

Uses: Corrosion inhibitors and detergents in petroleum processing equipment; wetting and emulsifying agents; inhibiting hydrochloric acid.

"Polyram."⁵⁵ Trademark for a wettable powder used as a fungicide and approved for many vegetables. Toxic by ingestion and inhalation.

polysaccharide. A combination of nine or more monosaccharides, linked together by glycosidic bonds. Examples: starch, cellulose, glycogen.

See also carbohydrate; phycocolloid.

polysiloxane. See siloxane.

"Poly-Solv."⁸⁴ Trademark for a series of glycol ether solvents for paints, varnishes, dry cleaning soaps, cutting oils, insecticides.

D2M. Diethylene glycol dimethyl ether. Used as anhydrous reaction medium for organometallic syntheses.

polysorbate (USAN name for a polyoxyethylene fatty acid ester). One of a group of nonionic surfactants obtained by esterification of sorbitol (q.v.) with one or three molecules of a fatty acid (stearic, lauric, oleic, palmitic) under conditions which cause splitting out of water from the sorbitol, leaving sorbitan. About 20 moles of ethylene oxide per mole of sorbi-

tol are used in the condensation to effect water solubility.

Properties: Lemon to amber oily liquids; sp. gr. about 1.1; faint odor and bitter taste; most types are soluble in water, alcohol, and ethyl acetate. Combustible; nontoxic.

Grades: Polysorbate 20 (polyoxyethylene (20) sorbitan monolaurate). Polysorbate 60 (polyoxyethylene (20) sorbitan monostearate). Polysorbate 80 (polyoxyethylene (20) sorbitan monooleate). Polysorbate 65 (polyoxyethylene (20) sorbitan tristearate).

Uses: Surfactant; emulsifying agent; dispersing agents; shortenings and baked goods; pharmaceuticals; flavoring agents; foaming and defoaming agents.

See also sorbitan fatty acid ester.

polystyrene ($\text{C}_6\text{H}_5\text{CHCH}_2$)_n. Polymerized styrene (q.v.), a thermoplastic synthetic resin of variable molecular weight depending on degree of polymerization.

Properties: Transparent, hard solid; high strength and impact resistance; excellent electrical and thermal insulator. Attacked by hydrocarbon solvents but resists organic acids, alkalis, and alcohols. Not recommended for outdoor use; unmodified polymer yellows when exposed to light, but light-stable modified grades are available. Easily colored, molded and fabricated. Copolymerization with butadiene and acrylonitrile and blending with rubber or glass fiber increase impact strength and heat resistance. (See ABS; SAN). Nontoxic.

Forms: Sheet, plates, rods, rigid foam, expandable beads or spheres.

Hazard: Combustible; autoignition temperature about 800°F. See also under foam, plastic.

Uses: Refrigerator doors; air conditioner cases; containers and molded household wares; machine housings; electrical equipment; toys; packaging; clock and radio cabinets; phonograph records. (As foam); thermal insulation; light construction as in boats, etc.; ice buckets, water coolers; fillers in shipping containers; furniture construction. (As spheres): Radiator leak stopper.

See also "Styron"; "Styrofoam."

"Polysulfide."²⁸ Trademark for a mixture similar to sulfated potash (q.v.), in which sodium replaces sulfur. Yellow to yellow-green powder; sodium polysulfide content, 56% min; total sulfur, 50.7% min.

Containers: 10-lb tins (6/case); 100-lb drums.

Uses: Coloring copper and brass; stripping copper-plated deposits; purifying cyanide plating solutions.

polysulfide elastomer. A synthetic polymer in either solid or liquid form obtained by the reaction of sodium polysulfide with organic dichlorides such as dichlorodiethyl formal, alone or mixed with ethylene dichloride. Outstanding for resistance to oils and solvents and for impermeability to gases. Poor tensile strength and abrasion resistance but are resilient and have excellent low-temperature flexibility. Some grades have fairly strong odor, which is not objectionable in most applications. Sealant grades are furnished in two parts which cure at room temperature when blended.

Uses: Gasoline and oil-loading hose; sealants and adhesive compositions; binder in solid rocket propellants; gaskets; paint spray hose.

See also "Thiokol."

polysulfone. A synthetic thermoplastic polymer.

Properties: Hard, rigid transparent solid; tensile strength 10,000 psi; sp. gr. 1.24; flexural strength 15,000 psi; good electrical resistance; minimum creep; low expansion coefficient. Soluble in aromatic

hydrocarbons, ketones and chlorinated hydrocarbons; resistant to corrosive acids and alkalis, to heat and oxidation, and to detergents, oils, and alcohols. Dimensionally stable over wide temperature range -150 to 300°F . Tends to absorb moisture. Readily processed and fabricated. Combustible but self-extinguishing.

Derivation: Condensation of bis-phenol A and dichlorophenyl sulfone.

Uses: Power-tool housings; electrical equipment; extruded pipe and sheet; auto components; electronic parts; appliances; computer components; base matrix for stereotype printing plates.

"Poly-Tergent."⁸⁴ Trademark for a series of emulsifiers.

polyterpene resin. A class of thermoplastic resins or viscous liquids of amber color, obtained by polymerization of turpentine in the presence of catalysts such as aluminum chloride or mineral acids. The resins consist essentially of polymers of alpha- or beta-pinene and are soluble in most organic solvents. Uses: Paints; rubber plasticizers; curing concrete; impregnating paper; adhesives; hot-melt coatings; pressure-sensitive tapes.

See also pinene.

polytetrafluoroethylene (PTFE: TFE) $(\text{C}_2\text{F}_4)_n$. A polymer of tetrafluoroethylene. It is essentially a straight chain of the repeating unit $[-\text{CF}_2-\text{CF}_2-]_n$. Soft and waxy, with a milk-white color. It can be molded by powder metallurgy techniques involving mixing with a diluent that is subsequently removed and sintering at 700°F .

Properties: Highly resistant to oxidation and action of chemicals, including strong acids, alkalis, oxidizing agents; resistant to nuclear radiation and ultraviolet rays, ozone, and weather. Halogenated solvents at high temperatures and pressures have some adverse effect. Retains useful properties from -450° to $+550^{\circ}\text{F}$ and is strong and tough. Low coefficient of friction (0.05), and antistick properties; excellent resistance to electricity. Coefficient of thermal expansion greater than other plastics and metals. Non-flammable.

Forms: Extrusion and molding powders, aqueous dispersion, film, multifilament fiber.

Uses: Gaskets, liners, seals, flexible hose; ablative coatings for rockets and space vehicles; chemical process equipment; coatings in aerospace; coaxial spacers, insulators, wire coating and tape in electrical and electronic fields; bearings, seals, piston rings for mechanical goods; antistick coatings for cooking vessels; felts, packings and bearings.

See also "Teflon"; "Halon."

polytetramethylene ether glycol. See "Polymeg."

"Poly-Tex."⁴⁷⁴ Trademark for polyvinyl acetate emulsion resins and thermosetting acrylic resins.

polythene. Generic name for polyethylene (q.v.); no longer current in the United States, but is still used in England.

polythiadiazole $[-\text{C}_6\text{H}_4-\text{C}_2\text{N}_2\text{S}-]_n$. A polymer made from polyoxathiahydrazide. Can be converted to fibers. Stated to retain properties to 750°F , and to have resistance to thermal degradation such that it retains 60 or 70% of original tenacity after 32 hours at 750°F .

polythiazyl $(\text{SN})_n$. An experimental polymer of sulfur nitride with covalent linkages, said to have the optical and electrical properties characteristic of metals. Thin films are reported to exhibit epitaxial growth.

polytrifluorochloroethylene resin. See chlorotrifluoroethylene resin.

polyunsaturated fat. A fat or oil based at least partly on fatty acids having two or more double bonds per molecule, such as linoleic or linolenic acids. Examples are corn oil and safflower oil.

Uses: Margarine and dietary foods; salad dressings, etc.

polyurethane. A thermoplastic polymer (which can be made thermosetting) produced by the condensation reaction of a polyisocyanate and a hydroxyl-containing material e.g., a polyol derived from propylene oxide or trichlorobutylene oxide. The basic polymer unit is formed as follows: $\text{R}_1\text{NCO} + \text{R}_2\text{OH} \rightarrow \text{R}_1\text{NHCOOR}_2$.

Fiber:

Properties: High elastic modulus, good electrical resistance; high moisture-proofness; crystalline structure. Combustible.

Derivation: Reaction of hexamethylene diisocyanate and 1,4-butanediol.

Uses: Chiefly in so-called spandex fibers (q.v.) for girdles and other textile structures requiring exceptional elasticity; bristles for brushes, etc.

Coatings:

Properties: Excellent hardness, gloss, flexibility, abrasion resistance, and adhesion; resistant to impact, weathering, acids and alkalis; attacked by aromatic and chlorinated solvents. Applied by brush, spray, or dipping. Combustible.

Derivation: Formed from "prepolymers" (q.v.) containing isocyanate groups (toluene and 4,4-diphenyl methane diisocyanates) and hydroxyl-containing materials such as polyols and drying oils.

Uses: Baked coatings; two-component formulations; wire coatings; tank linings; maintenance paints; masonry coating.

Elastomers:

Properties: Good resistance to abrasion, weathering, and organic solvents; tend to harden and become brittle at low temperatures. Combustible.

Derivation: Reaction of polyisocyanates with linear polyesters or polyethers containing hydroxyl groups.

Uses: Sealants and caulking agents; adhesives; films and linings; shoe uppers and heels; encapsulation of electronic parts; binders for rocket propellants; abrasive wheels and other mechanical items; auto bumpers, fenders and other components.

Foams:

Properties: Both flexible and rigid foams are available. Density varies from 2 to 50 pounds per cubic foot; thermal conductivity as low as 0.11; excellent insulators.

Hazard: Combustible unless protected by effective thermal barrier. See also under foam, plastic.

Derivation: A polyether such as polypropylene glycol is treated with a diisocyanate in the presence of some water and a catalyst (amines, tin soaps, organic tin compounds). As the polymer forms, the water reacts with the isocyanate groups to cause cross linking, and also produces carbon dioxide which causes foaming. In other cases trifluoromethane or similar volatile material may be used as blowing agent.

Flexible foams are based on polyoxypropylenediols of 2000 molecular weight and triols up to 4000.

Rigid foams are based on polyethers made from sorbitol, methyl glucoside, or sucrose.

Uses: (Flexible) Furniture; mattresses; laminates and linings; building insulation; flooring leveling; seat cushions and other automotive accessories; carpet underlays; upholstery; absorbent of crude oil spills on seawater. (Rigid) Furniture; packaging and packing; marine flotation; auto components; cigarette filters; light structures, as boat hulls; soundproofing; salvaging operations; ship-building (for buoyancy); transportation insulation for box cars, refrigerated cars, tank and hopper cars, trucks and trailers (claimed to be twice as effective as glass fiber); insulation for storage tanks, ships' holds, and pipelines.

polyvinyl acetal. One of the family of vinyl resins resulting from the condensation of polyvinyl alcohol with an aldehyde; acetaldehyde, formaldehyde and butyraldehyde are commonly used. The three main groups are polyvinyl acetal itself, polyvinyl formal, and polyvinyl butyral. These are all thermoplastic, and can be processed by extruding, molding, coating and casting. They are used chiefly in adhesives, paints and lacquers, and films. Polyvinyl butyral is used in sheet form as an interlayer in safety glass and shatter-resistant acrylic protection in aircraft.

polyvinyl acetate (PVAc). $[-CH_2CH(OOCCH_3)-]_x$. A thermoplastic high polymer.

Properties: Colorless, odorless, transparent solid; sp. gr. 1.19 at 15°C; insoluble in water, gasoline, oils and fats; soluble in low molecular weight alcohols, esters, benzene, and chlorinated hydrocarbons. Resistant to weathering. Combustible; nontoxic.

Derivation: Polymerization of vinyl acetate with peroxide catalysts.

Uses: Latex water paints; adhesives for paper, wood, glass, metals, and porcelain; intermediate for conversion to polyvinyl alcohol and acetals; sealant; shatterproof photographic bulbs; paper coating and paperboard; bookbinding; textile finishing; nonwoven fabric binder; component of lacquers, inks, and plastic wood; strengthening agent for cements.

polyvinyl alcohol (PVA; PVOH) $(-CH_2CHOH-)_x$. A water-soluble synthetic polymer made by alcoholysis of polyvinyl acetate.

Properties: White to cream-colored powder; sp. gr. 1.27–1.31. Refractive index 1.49–1.53. Properties depend on degree of polymerization (q.v.) and the percentage of alcoholysis, both of which are controllable in processing. Water solubility increases as molecular weight decreases; strength, elongation, tear resistance, and flexibility improve with increasing molecular weight decreases; strength, elongation, tear resistance, and flexibility improve with increasing molecular weight. Tensile strength up to 22,000 psi; decomposes at 200°C. PVA has high impermeability to gases; is unaffected by oils, greases, and petroleum hydrocarbons. Attacked by acids and alkalis. It forms films by evaporation from water solution. Combustible. Low toxicity.

Grades: Super-high viscosity (m.w. 250,000–300,000); high-viscosity (m.w. 170,000–220,000); medium-viscosity (m.w. 120,000–150,000); low viscosity (m.w. 25,000–35,000).

Uses: Textile warp and yarn size; laminating adhesives; binder for cosmetic preparations, ceramics, leather, cloth, nonwoven fabrics, and paper; paper coatings; greaseproofing paper; emulsifying agent; thickener and stabilizer; photosensitive films; cements and mortars; intermediate for other polyvinyls; component of mixtures for coloring shell eggs.

polyvinylbenzyltrimethyl ammonium chloride. An electrically conductive polymer, used to increase the conductivity of papers.

polyvinyl butyral. See polyvinyl acetal.

polyvinyl carbazole. A brown, thermoplastic resin obtained by the reaction of acetylene with carbazole. It softens about 150°C, has excellent dielectric properties, good heat and chemical stability, but poor mechanical strength. It is used principally as a substitute for mica in electrical equipment and as an impregnant for paper capacitors.

polyvinyl chloride (PVC) $(-H_2CCHCl-)_x$. A synthetic thermoplastic polymer.

Properties: White powder or colorless granules. Resistant to weathering and moisture; dimensionally stable; good dielectric properties; resistant to most acids, fats, petroleum hydrocarbons and fungus. Readily compounded into flexible and rigid forms by use of plasticizers, stabilizers, fillers, and other modifiers. Easily colored and processed by blow molding, extrusion, calendaring, fluid bed coating, etc. Available as film, sheet, fiber and foam.

Derivation: Polymerization of vinyl chloride (q.v.) by suspension, emulsion, and solution methods. May be copolymerized with up to 15% of other vinyls.

Hazard: Decomposes at 300°F, evolving toxic fumes of hydrogen chloride. Tolerance, 1 ppm in air. See also vinyl chloride, and note.

Uses: Piping and conduits of all kinds; siding; gutters; window and door frames; officially approved for use in interior piping, plumbing, and other construction uses; raincoats, toys, gaskets, garden hose, electrical insulation, shoes, magnetic tape, film and sheeting; containers for toiletries, cosmetics, household chemicals and food products; fibers for athletic supports; sealant liners for ponds and reservoirs; adhesive and bonding agent; plastisols and organosols; tennis court playing surfaces; flooring; coating for paper and textiles; wire and cable protection; base for synthetic turf; phonograph records.

Note: Use of PVC in rigid and semirigid food containers, such as bottles, boxes, etc., is under restriction by FDA, as well as in coatings for fresh citrus fruits. Its use in thinner items such as films and package coatings is permissible. Possibility of migration of vinyl chloride monomer into food products is the critical factor; this tends to increase with the thickness of the material.

polyvinyl chloride-acetate. A vinyl chloride and vinyl acetate that is inherently more flexible than polyvinyl chloride. The copolymer usually contains 85 to 97% of the chloride. It is generally similar in properties and uses to polyvinyl chloride.

polyvinyl dichloride (PVDC). A chlorinated polyvinyl chloride. Has high strength and superior chemical resistance over a broad temperature range; self-extinguishing. Used for pipe and fittings for hot corrosive materials up to 212°F. Is immune to solvation or direct attack by inorganic reagents, aliphatic hydrocarbons and alcohols.

polyvinyl ether. See polyvinyl ethyl ether; polyvinyl isobutyl ether; polyvinyl methyl ether; polyvinyl methyl ether-maleic anhydride.

polyvinyl ethyl ether (PVE; polyvinyl ether) $[-CH(OC_2H_5)CH_2-]_n$.

Properties: Viscous gum to rubbery solid, depending on molecular weight. Colorless when pure; sp. gr. 0.97 (20°C); refractive index 1.45 (25°C). Insoluble in water; soluble in nearly all organic solvents. Sta-

ble toward dilute and concentrated alkalis and dilute acids. Compatible with a limited number of commercial resins, including rosin derivatives and some phenolics.

Derivation: Polymerization of vinyl ethyl ether.

Uses: Pressure-sensitive tape; to improve adhesion to porous surfaces, cellophane, cellulose acetate and vinyl sheet.

polyvinyl fluoride ($-\text{H}_2\text{CCHF}-$)_n. Polymer of vinyl fluoride. In film form it is characterized by superior resistance to weather, high strength, high dielectric constant, low permeability to air and water, as well as oil, chemical solvent and stain resistance.

Hazard: Not recommended for food packaging. Evolves toxic fumes on heating.

Uses: Protective material for outdoor use; packaging; electrical equipment.

polyvinyl formal. See polyvinyl acetal.

polyvinylidene chloride (saran). A stereoregular, thermoplastic polymer.

Properties: Tasteless, odorless, nontoxic; abrasion-resistant; low vapor transmission; impermeable to flavor. Highly inert to chemical attack; softened by chlorinated hydrocarbons and soluble in cyclohexanone and dioxane. Combustible but self-extinguishing.

Derivation: Polymerization of vinylidene chloride (q.v.) or copolymerization of vinylidene chloride with lesser amounts of other unsaturated compounds.

Forms: Extruded and molded products; oriented fibers; films.

Uses: Packaging of food products, especially meats and poultry; insecticide-impregnated multiwall paper bags; pipes for chemical processing equipment; seat covers, upholstery, fibers, bristles, latex coatings.

See also saran fiber; "Cryovac."

polyvinylidene fluoride $\text{CH}_2 = \text{CF}_2$. A thermoplastic fluorocarbon polymer suitable for compression and injection molding and extrusion.

Properties: Crystalline melting point 340°F. Thermally stable from -80 to 300°F. Self-extinguishing and nondripping. Tensile strength 7000 psi at 77°F; yield stress 5500 psi; elongation 300%; compression strength 10,000 psi; thermal conductivity 1.05 Btu/hr/sq ft/°F/in; water absorption 0.04% in 24 hrs; sp. gr. 1.76; refractive index 1.42. Resistant to oxidative degradation, electricity, acids, alkalis, oxidizers, halogens. Somewhat soluble in dimethylacetamide; attacked by hot conc. sulfuric acid or n-butylamine.

Forms: Powder, pellets, solution, and dispersion.

Uses: Insulation for high-temperature wire, tank linings, chemical tanks and tubing, protective paints and coatings with exceptional resistance (30 years) to weathering and U.V.; valve and impeller parts; shrinkage tubing to encapsulate resistors, diodes, and soldered joints; sealant.

polyvinyl isobutyl ether (PVI; polyvinyl ether)

$[-\text{CH}(\text{OCH}_2\text{CH}(\text{CH}_3)_2)\text{CH}_2-]$ _n.

Properties: White, opaque elastomer or viscous liquid depending on molecular weight; almost odorless. Sp. gr. 0.91-0.93 (20°C); refractive index 1.45-1.46 (25°C). Insoluble in water, ethanol, and acetone; soluble in most other organic solvents. Stable toward dilute and concentrated alkalis and dilute acids. Compatible with a limited number of commercial resins, including rosin derivatives and some phenolics. Combustible.

Derivation: Polymerization of vinyl isobutyl ether (q.v.) by peroxides or acid catalysts.

Grades: As 100% material in three molecular weight ranges.

Uses: Adhesives, waxes, tackifiers, plasticizers, surface coatings, laminating agents, cable filling compositions, lubricating oils.

polyvinyl methyl ether (PVM). $(-\text{CH}_2\text{CHOCH}_3-)$ _n. A nonionic polymer of high molecular weight.

Properties: Colorless (when pure) tacky liquid; soluble in water below 32°C, above which it precipitates from water but redissolves on cooling. Soluble in most organic solvents except aliphatic hydrocarbons. Compatible with rubber latexes, rosin derivatives, and some phenolics. Sp. gr. 1.05; refractive index 1.47; solidifies near 0°C. Combustible; low toxicity.

Derivation: Polymerization of vinyl methyl ether (q.v.) with peroxides or acid catalysts.

Uses: Pressure-sensitive and hot-melt adhesives; bonding of paper to polyethylene; laminating adhesive; tackifier and plasticizer for coatings; heat sensitizer for rubber latex; pigment binder in textile finishing; printing inks; protective colloid in emulsions.

polyvinyl methyl ether-maleic anhydride (PVM/MA). Water-soluble copolymer of vinyl methyl ether and maleic anhydride

$[-\text{CH}_2\text{CHOCH}_3\text{CHCOOCOCH}-]$ _n.

Uses: Protective colloid, dispersing agent, thickener, binder, adhesive and size in coatings, detergents, emulsions, paper, textiles, leather, latex, rust preventive, foam stabilizer.

poly-2-vinylpyridine $(-\text{CH}(\text{C}_3\text{H}_4\text{N})-\text{CH}_2-)$ _n. A vinyl-type polymer suggested for use as a photographic dye mordant, tablet coating material, antistat for textiles and paper, and textile dye receptor.

polyvinylpyrrolidone (PVP) ($\text{C}_6\text{H}_9\text{NO}$)_n.

Properties: White, free-flowing amorphous powder or aqueous solution. Soluble in water and organic solvents. Combustible with wide range of hydrophilic and hydrophobic resins. Sp. gr. 1.23-1.29; bulk density 25 lb per cubic foot. Hygroscopic; nontoxic.

Grades: Various molecular weights: 10,000; 40,000; 160,000; 360,000.

Uses: Pharmaceuticals; blood plasma expander; cast films adherent to glass, metals, and plastics; complexing agent; detoxification of chemicals such as dyes, iodine, phenol, and poisonous drugs; tableting; photographic emulsions; cosmetics (hair sprays, shampoos, hand creams, skin lotions); dentifrices; dye-stripping; textile finishes; protective colloid; detergents; adhesives; beer and wine clarification.

polyvinyl resin (vinyl plastic). Any of a series of polymers (resins) derived by polymerization or copolymerization of vinyl monomers ($\text{CH}_2=\text{CH}-$) including vinyl chloride and acetate, vinylidene chloride, methyl acrylate and methacrylate, acrylonitrile, styrene, the vinyl ethers, and numerous others. Specifically, polyvinyl chloride, acetate, alcohol, etc., and copolymers or closely related materials. See under both vinyl and polyvinyl.

"Polywood."⁴⁴⁸ Trademark for polyester coatings for wood furniture and other wood products.

"Polyzime" P.²¹² Trademark for a product containing diastatic and proteolytic enzymes.

Properties: Dry, fine white powder; fully water soluble; nontoxic; nonflammable; optimum pH for dia-

static reaction, 7.0-7.2, for proteolytic reaction 7.5-8.0; optimum temperature 45°C.

Use: Desizing of textile fabrics preparatory to dyeing, bleaching, mercerizing printing and finishing.

"Poly-Zole" AZDN.⁵¹¹ Trademark for azodiisobutyronitrile, a blowing agent and catalyst for plastics.

"Pomalus."²⁴³ Trademark for food grade of malic acid.

Ponceau 3R (CH₃)₂C₆H₂NNC₁₀H₄(OH)(SO₃Na)₂. 3-Hydroxy-4-[2,4,5-trimethylphenyl]azo]-2,7-naphthalenedisulfonic acid, disodium salt. A water-soluble red dye, C.I. No. 16155.

Properties: Dark-red powder. Soluble in water and acids to form a cherry-red solution; slightly soluble in alcohol; insoluble in alkalis.

Uses: Dyeing wool; biological stain.

"Ponolith."²⁸ Trademark for a type of highly dispersed pigments used primarily for the coloring and tinting of paper.

"Ponsol."²⁸ Trademark for a series of vat dyes derived from anthraquinone. Used for dyeing and printing of cotton and rayon.

"Ponstan."³³⁰ Trademark for mefenamic acid.

"Pontachrome."²⁸ Trademark for a series of colors used on wool and nylon. Dyed by forming chromium lakes on the fiber.

"Pontacyl."²⁸ Trademark for a series of acid colors for wool, nylon, silk, leather, paper, and some types of "Orlon" acrylic fiber. Dyed in an acid bath. Produces bright shades.

"Pontamine."²⁸ Trademark for a series of dyes and developers for textile fibers, paper and leather.

pontianak. A type of Manila resin (q.v.) which is semi-fossil, hard, and soluble in oils and hydrocarbons.

Uses: Adhesives; paints, varnishes, and lacquers. See also copal resin.

"Pontocaine" Hydrochloride.¹⁶² Trademark for tetracaine hydrochloride (q.v.).

POPDA. See polyoxypropylene diamine.

POPOP. Abbreviation for phenyl-oxazolyl-phenyl-oxazolyl-phenyl. See 1,4-bis[2-(5-phenyloxazolyl)]-benzene.

porcelain. Potassium aluminum silicate (4K₂O · Al₂O₃ · 3SiO₂). A mixture of clays, quartz and feldspar, usually containing at least 25% of alumina. Ball and china clays are ordinarily used. A slip or slurry is formed with water to form a plastic, moldable mass, which is then glazed and fired to a hard, smooth solid.

Properties: High impact strength; impermeable to liquids and gases; resistant to chemicals except hydrofluoric acid and hot, strong caustic solutions; usable up to 2000°F but subject to heat shock; sp. gr. 2.41, Mohs hardness 6-7, compression strength 100,000 psi.

Grades: Chemical and electrical.

Uses: Reaction vessels, sparkplugs, electrical resistors; electron tubes; corrosion-resistant equipment; ball mills and grinders; food-processing equipment; piping, valves, pumps, tower packing, lab ware.

See also ceramics; porcelain enamel; porcelain, zircon.

porcelain enamel. A substantially vitreous inorganic coating bonded to metal by fusion above 800°F (ASTM). Composed of various blends of low-sodium

frit (q.v.), clay, feldspar and other silicates; ground in a ball mill and sprayed onto a metal surface (steel, iron, or aluminum) to which it bonds firmly after firing, giving a glass-like, fire-polished surface.

Properties: High hardness, abrasion and chemical resistance except to HF and hot, strong caustic; low expansion coefficient; corrosion-resistant; stable to heat-shock; easy to clean and decontaminate.

Uses: Chemical reaction equipment; light reflectors; lab bench tops; storage tanks and containers; high-temperature process equipment; sea-water treatment and marine engine parts; glazing frit.

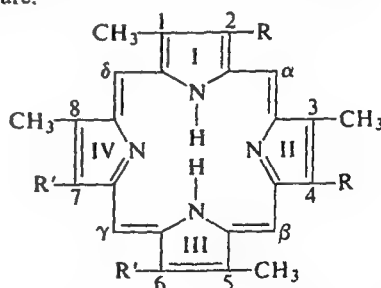

See also porcelain; glaze.

porcelain, zircon. (ZrO₂ · SiO₂). A special high-temperature porcelain used for spark plugs and furnace trays because of its high mechanical strength and heat-shock resistance. Usable up to 1700°C. High dielectric strength, but rather low power factor at high frequencies.

"Porocel."⁹⁹ Trademark for an activated bauxite. Supplied in various standard meshes, moisture contents, and in regular low iron and low silica grade. Use: Absorbent catalysts.

poromeric. A term coined to describe the microporosity, air-permeability, and water- and abrasion resistance of natural and synthetic leather. The pores decrease in diameter from the inner surface to the outer and thus permit air and water vapor to leave the material while excluding water from the outside. Polyester-reinforced urethane resins have poromeric properties, and vinyl resins have been used as leather substitutes with some success, primarily for shoe uppers. A recently introduced synthetic poromeric for this purpose is trademarked "Xylee."

porphyrin. Any of several physiologically active nitrogenous compounds occurring widely in nature. The parent structure is comprised of four pyrrole rings, shown as I, II, III, IV in the diagram below, together with four nitrogen atoms and two replaceable hydrogens, for which various metal atoms can be readily substituted. A metal-free porphyrin molecule has the structure:

Porphyrins of this type have been made synthetically by passing an electric current through a mixture of ammonia, methane, and water vapor. Biochemists believe that this phenomenon may account for the original formation of chlorophyll and other porphyrins which have been essential factors in the origin of life.

The most important porphyrin derivatives are characterized by a central metal atom; hemin is the iron-containing porphyrin essential to mammalian blood, and chlorophyll is the magnesium-containing porphyrin that catalyzes photosynthesis. Other derivatives of importance are cytochromes, which function in cellular metabolism, and the phthalocyanine group of dyes.

"Poroplastic."⁵⁷⁸ Trademark for a microporous plastic material reported to be effective for the controlled release of fragrances, flavors, medicinals, pesticides, etc. It has the mechanical properties of a polymer with pore size of molecular dimensions, which enable it to carry a "payload" of up to 98% of a liquid or solid immobilized within its structure. Compounds can be selectively admitted into or excluded from the material on a precisely controlled basis. Produced as microbeads, films, and granules.

porpoise oil (dolphin oil).

Properties: Pale yellow liquid; sp. gr. 0.926–0.929; saponification value about 290; iodine value 10 to 30. Soluble in ether, chloroform, benzene and carbon disulfide. The refined jaw and head oil has uniquely low pour point and high lubricity and is highly resistant to gumming, oxidation and evaporation.

Grades: Technical; also sold as body oil, jaw oil and junk oil (from the face blubber).

Containers: Steel drums; tins; glass bottles; vials.

Uses: Lubricant for watches and precision instruments.

"Portite."³²⁶ Trademark for corrosion-resistant masonry sulfur-base cement.

Portland cement. See cement, Portland.

potash. See potassium carbonate. Also refer to American Potash Institute, 16th St. N.W., Washington, D.C.

potash alum. See aluminum potassium sulfate.

potash, caustic. See potassium hydroxide.

potash chrome alum. See chromium potassium sulfate.

potash feldspar. See feldspar.

potash magnesia double salt. A material containing potassium carbonate, magnesium sulfate and a low proportion of chloride, containing 20–30% K₂O and used as a fertilizer.

potash, sulfurated (potassium, sulfurated). A mixture composed chiefly of potassium polysulfides and potassium thiosulfate, containing not less than 12.8% sulfur in combination as sulfide.

Properties: Liver brown when freshly made, changing to a greenish yellow; odor of hydrogen sulfide; bitter, acid, and alkaline taste; decomposes upon exposure to air; soluble in water leaving a residue.

Grade: U.S.P.

Uses: Medicine; decorative color effects on brass, bronze and nickel.

potassium K Element of atomic number 19, group 1A of the periodic system; an alkali metal. Atomic weight 39.102; valence 1. Potassium 40 is a naturally occurring radioactive isotope. There are also two stable isotopes. The synthetic isotope, potassium 42, is used in tracer studies, primarily in medicine. An essential element in plant growth; occurs in all soils.

Properties: Soft, silvery metal; rapidly oxidized in moist air. Sp. gr. 0.862; m.p. 63°C; b.p. 770°C. Soluble in liquid ammonia, aniline, mercury, and sodium. Derivation: Ores and deposits in Stassfurt (Germany), Carlsbad (New Mexico), Saskatchewan (Canada), Seale Lake (California), Great Salt Lake (Utah), Yorkshire (England), Ural Mts (USSR), Israel and eastern Mediterranean area. Most important ores

are carnallite, sylvite, and polyhalite. Thermochemical distillation of potassium chloride with sodium is the chief U.S. method of production.

Grades: Technical; 99.95% pure.

Hazard: Dangerous fire risk; reacts with moisture to form potassium hydroxide and hydrogen. The reaction evolves much heat causing the potassium to melt and spatter. It also ignites the hydrogen. Burning potassium is difficult to extinguish; dry powdered soda ash or graphite or special mixtures of dry chemical is recommended. It can ignite spontaneously in moist air. Moderate explosion risk by chemical reaction. Potassium metal will form the peroxide and the superoxide at room temperature even when stored under mineral oil; may explode violently when handled or cut. Oxide-coated potassium should be destroyed by burning. Store in inert atmospheres, such as argon or nitrogen, or under liquids which are oxygen-free, such as toluene or kerosene, or in glass capsules which have been filled under vacuum or inert atmosphere.

Uses: Preparation of potassium peroxide; heat exchange alloys (See NaK); laboratory reagent; seeding of combustion gases in magnetohydrodynamic generators.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

potassium abietate K₂CC₁₉H₂₉. Water-soluble soap resulting from action of rosin and potassium hydroxide. Used as a pesticide.

potassium acetate KC₂H₃O₂.

Properties: White, crystalline deliquescent powder; saline taste. Soluble in water and alcohol; insoluble in ether. Solutions alkaline to litmus but not to phenolphthalein. M.p. 292°C; sp. gr. 1.57 (25°C). Low toxicity; combustible.

Derivation: By the action of acetic acid on potassium carbonate.

Grades: Pure; pure fused; C.P.; N.F. reagent.

Containers: Bottles; drums.

Uses: Dehydrating agent; textile conditioner; reagent in analytical chemistry; medicine; acetone; cacodylic derivatives; crystal glass; laboratory reagent.

potassium acid carbonate. See potassium bicarbonate.

potassium acid fluoride. See potassium bifluoride.

potassium acid oxalate. See potassium binoxalate.

potassium acid phosphate. See potassium phosphate, monobasic.

potassium acid saccharate HOOC(CHOH)₄COOK.

Properties: Light, off-white powder; pH of solution, 3.5; slightly soluble in cold water; soluble in hot water, acid, or alkaline solutions. Combustible.

Uses: Chelating agent; rubber formulations; metal plating; soaps and detergents.

potassium acid sulfate. See potassium bisulfate.

potassium acid sulfate, anhydrous. See potassium pyrosulfate.

potassium acid sulfite. See potassium bisulfite.

potassium acid tartrate. See potassium bitartrate.

potassium alginate (potassium polymannuronate)

(C₆H₇O₆K)_n. Hydrophilic colloid having a molecular weight of 32,000 to 250,000.

Properties: Occurs in filamentous, grainy, granular,

and powdered forms. It is colorless or slightly yellow and may have a slight characteristic smell and taste. Slowly soluble in water forming a viscous solution; insoluble in alcohol. Combustible; nontoxic. Grades: Technical; F.C.C.
Uses: Thickening agent and stabilizer in dairy products, canned fruits and sausage casings; emulsifier. See also alginic acid.

potassium alum. See aluminum potassium sulfate.

potassium aluminate $K_2Al_2O_4 \cdot 3H_2O$.

Properties: Hard crystals, lustrous. Soluble in water with hydrolysis to form strongly alkaline solution; insoluble in alcohol.
Derivation: By fusing potassium hydroxide with aluminum oxide.
Grade: Technical.
Uses: Dyeing, printing (mordant); lakes; paper sizing.

potassium aluminosilicate. See feldspar.

potassium aluminum fluoride K_3AlF_6 .

Properties: White powder; slightly soluble in water.
Derivation: Aluminum fluoride, ammonium fluoride, and potassium chloride.
Containers: Fiber cans.
Hazard: Toxic by ingestion and inhalation; strong irritant. Tolerance (as F), 2.5 mg per cubic meter of air.
Use: Insecticide.

potassium aluminum sulfate. See aluminum potassium sulfate.

potassium antimonyl tartrate. See antimony potassium tartrate.

potassium argentocyanide. See silver potassium cyanide.

potassium arsenate (Macquer's salt) KH_2AsO_4 .

Properties: Colorless crystals; sp. gr. 2.867; m.p. 288°C; soluble in water; insoluble in alcohol.
Hazard: Highly toxic by ingestion and inhalation; strong irritant.
Uses: Manufacture of fly paper; insecticidal preparations; laboratory reagent; preserving hides; printing textiles.
Shipping regulations: (Rail, Air) Poison label.

potassium arsenite (potassium metaarsenite)

$KH(AsO_2)_2 \cdot H_2O$.
Properties: White powder; hygroscopic; decomposes slowly in air. Variable composition. Keep well stoppered! Soluble in water; slightly soluble in alcohol.
Grades: Technical; reagent.
Hazard: Highly toxic by ingestion and inhalation; strong irritant.
Uses: Medicine; mirrors.
Shipping regulations: (Rail, Air) Poison label.

potassium aurate $KAuO_2 \cdot 3H_2O$.

Properties: Yellow crystals; soluble in water, alcohol.
Derivation: Gold oxide dissolved in potassium hydroxide solution.
Use: To prepare other gold compounds.

potassium beryllium fluoride. See beryllium potassium fluoride.

potassium bicarbonate (potassium acid carbonate; baking soda) $KHCO_3$.

Properties: Colorless, odorless, transparent crystals or white powder; slightly alkaline, salty taste. Soluble in water and potassium carbonate solution; insoluble in alcohol. Sp. gr. 2.17; m.p., dec. between 100° and 120°C; refractive index 1.482.

Derivation: By passing carbon dioxide into a solution of potassium carbonate in water.

Grades: Commercial; highest purity; U.S.P.; reagent; F.C.C.

Containers: Drums; bags.

Uses: Baking; soft drinks; medicine (antacid); manufacture of pure potassium carbonate; fire-extinguishing agent; low pH liquid detergents; laboratory reagent.

potassium bichromate. See potassium dichromate.

potassium bifluoride (potassium acid fluoride; potassium hydrogen fluoride) KHF_2 .

Properties: Colorless crystals; decomposed by heat. Soluble in alcohol (dilute), water; insoluble in alcohol (absolute). Sp. gr. 2.37; decomposes about 225°C.
Grade: Technical.
Hazard: Highly toxic and corrosive to tissue. Tolerance (as F), 2.5 mg per cubic meter of air.
Uses: Etching glass; production of fluorine; flux in metallurgy.
Shipping regulations: (Air) Solid: Poison label. Solution: Corrosive label.

potassium binoxalate (potassium acid oxalate; acid potassium oxalate; sorrel salt) $KHC_2O_4 \cdot \frac{1}{2}H_2O$.

Properties: White crystals; bitter, sharp taste; somewhat hygroscopic. Soluble in water; insoluble in alcohol; sp. gr. of the anhydrous salt 2.088; m.p. decomposes when heated.
Derivation: Neutral potassium oxalate and oxalic acid are dissolved in water and crystallized.
Hazard: Toxic, by ingestion.
Uses: Removing ink stains; scouring metals; cleaning wood; photography; bleaching; laboratory reagent.

potassium bismuth tartrate (bismuth potassium tartrate).

Properties: White, granular powder. Odorless; sweet taste; variable composition. Contains 60 to 64% bismuth. Decomposed by dilute mineral acid; darkens when exposed to light. Soluble in water; insoluble in alcohol, chloroform, ether.
Use: Medicine.

potassium bisulfate (acid potassium sulfate; potassium hydrogen sulfate; potassium acid sulfate) $KHSO_4$.

Properties: Colorless crystals; the fused salt is deliquescent. Soluble in water, yielding a solution with acid reaction; decomposes in alcohol. Sp. gr. 2.245; m.p. 214°C; b.p., decomposes. Low toxicity.
Derivation: Heating potassium sulfate with sulfuric acid.
Uses: Conversion of wine lees and tartrates into potassium bitartrate; flux; manufacture of mixed fertilizers; anisole; methyl acetate; ethyl acetate; laboratory reagent.

potassium bisulfide. See potassium hydrosulfide.

potassium bisulfite (potassium acid sulfite; potassium hydrogen sulfite) $KHSO_3$.

Properties: White, crystalline powder; sulfur dioxide odor. Soluble in water; insoluble in alcohol. M.p., decomposes at 190°C. Low toxicity.
Derivation: Sulfur dioxide is passed through a solution of potassium carbonate until no more carbon dioxide is given off; the solution is concentrated and allowed to crystallize.
Grades: Commercial; reagent; medicinal.
Uses: Reduction of various organic compounds; purification of aldehydes and ketones, iodine, sodium hydrosulfite; antiseptic; source of sulfurous acid, particularly in brewing; analytical chemistry; tan-

ning; bleaching straw and textile fibers; chemical preservative in foods, except meats and other sources of vitamin B₁.

potassium bitartrate (cream of tartar; potassium acid tartrate) $\text{KHC}_4\text{H}_4\text{O}_6$.

Properties: White crystals or powder; soluble in water; pleasant slightly acid taste; insoluble in alcohol. Sp. gr. 1.984 (18°C). Nontoxic.

Derivation: From wine lees by extraction with water and crystallization.

Grades: Technical; N.F.; F.C.C.

Containers: Barrels; multiwall paper bags.

Uses: Baking powder; preparation of other tartrates; medicine; galvanic tinning of metals; in foods as acid and buffer.

potassium borate. See potassium tetraborate.

potassium borofluoride. See potassium fluoborate.

potassium borohydride KBH_4 .

Properties: White crystalline powder; soluble in water, alcohol, ammonia; insoluble in ethers and hydrocarbons; sp. gr. 1.18; stable in moist and dry air; stable in vacuum to 500°C. Decomposed by acids with evolution of hydrogen.

Derivation: By metathetical reaction of sodium borohydride and potassium hydroxide.

Grades: Technical; powder; pellets.

Containers: Glass bottles; polyethylene bags in drums.

Hazard: Flammable, dangerous fire risk.

Uses: Source of hydrogen and other borohydrides; reducing agent for aldehydes, ketones and acid chlorides.

Shipping regulations: (Rail) Flammable Solid, n.o.s., Yellow label. (Air) Flammable Solid label.

potassium bromate KBrO_3 .

Properties: White crystals or crystalline powder. Soluble in water; slightly soluble in alcohol; sp. gr. 3.27; m.p. 434°C, with decomposition above 370°C. Strong oxidizing agent.

Derivation: By passing bromine into a solution of potassium hydroxide.

Grades: Pure; C.P.; F.C.C.

Hazard: Dangerous fire risk in contact with organic materials.

Uses: Laboratory reagent; oxidizing agent; permanent wave compounds; maturing agent in flour; dough conditioner; food additive.

Shipping regulations: (Rail) Yellow label; (Air) Oxidizer label.

Note: Food additive uses restricted as to proportions used.

potassium bromide KBr .

Properties: White, crystalline granules or powder; pungent, strong, bitter saline taste; somewhat hygroscopic. Soluble in water and glycerin; slightly soluble in alcohol and ether; sp. gr. 2.749; m.p. 730°C; b.p. 1435°C.

Derivation: Solutions of iron bromide and potassium carbonate are mixed and heated, the solution filtered and concentrated and the bromide crystallized out.

Grades: Technical; C.P.; N.F.; reagent; single crystals.

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Medicine; photography (gelatin bromide papers and plates); process engraving and lithography; special soaps; spectroscopy; infrared transmission; laboratory reagent.

potassium tert-butoxide. See potassium tert-butyrate.

potassium tert-butyrate (potassium tert-butoxide)

$(\text{CH}_3)_3\text{COK}$. White, hygroscopic powder; a strong organic base.

Hazard: Flammable; may cause severe caustic burns.

potassium carbonate (potash, pearl ash) (a) K_2CO_3 ; (b) $\text{K}_2\text{CO}_3 \cdot 1\frac{1}{2}\text{H}_2\text{O}$.

Properties: White, deliquescent, granular translucent powder; alkaline reaction. Soluble in water; insoluble in alcohol. (a) Sp. gr. 2.428 (19°C); m.p. 891°C; b.p., decomposes. Noncombustible.

Derivation: (1) Engel-Precht process uses magnesium oxide, potassium chloride, and carbon dioxide, separating the Engels salt ($\text{MgCO}_3 \cdot \text{KHCO}_3 \cdot 4\text{H}_2\text{O}$). Decomposition leaves potassium bicarbonate in solution which can be processed to potassium carbonate. (2) Alkyl amines or ion-exchange resins can be used with potassium chloride and carbon dioxide to yield potassium bicarbonate, which is calcined to the carbonate. This is analogous to the Solvay process for sodium carbonate (q.v.).

Grades: Crystals; technical; reagent; calcined 80-85%, 85-90%, 90-95%, 96-98%; hydrated 80-85%; F.C.C.

Containers: Drums; bags; kegs; barrels; unit trains.

Hazard: Solutions irritant to tissue.

Uses: Special glasses (optical and color TV tubes), potassium silicate; dehydrating agent; pigments; printing inks; laboratory reagent; soft soaps; raw wool washing; general-purpose food additive.

potassium chlorate KClO_3 .

Properties: Transparent, colorless crystals or white powder; cooling, saline taste. Soluble in water, alkalis, and alcohol. Sp. gr. 2.337; m.p. 356°C; b.p., decomposes at 400°C, giving off oxygen.

Derivation: (a) By electrolyzing a hot concentrated alkaline solution of potassium chloride. Preferably (b) by interaction of solutions of potassium chloride and sodium chlorate or calcium chlorate.

Hazard: Moderately toxic; flammable; forms explosive mixtures with combustible materials (sulfur, sugar, etc.). Strong oxidizing agent.

Uses: Oxidizing agent; explosives; matches; source of oxygen; textile printing; pyrotechnics; percussion caps; medicines; dyes; paper manufacture; disinfectant; bleaching.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label. Legal label name (Rail): chlorate of potash.

potassium chloride KC .

Properties: Colorless or white crystals; strong saline taste. Occurs naturally as sylvite. Soluble in water; slightly soluble in alcohol; insoluble in absolute alcohol. Sp. gr. 1.987; m.p. 772°C; sublimes at 1500°C; noncombustible; low toxicity.

Derivation: (a) Mined from sylvite deposits in New Mexico and Saskatchewan, purified by fractional crystallization or flotation; (b) extracted from salt lake brines, and purified by recrystallization.

Grades: Chemical (99.5 and 99.9%); agricultural grades sold as 60-62%, 48-52% and 22% K_2O ; single crystals; U.S.P.; F.C.C.

Containers: Bags; drums; bulk.

Uses: Fertilizer; source of potassium salts; pharmaceutical preparations; photography; spectroscopy; plant nutrient; salt substitute; laboratory reagent.

potassium chloroaurate. See potassium gold chloride.

potassium chlorochromate (Peligot's salt) KClCrO_4 .
Properties: Red crystals; on heating liberates chlorine.
Soluble in water (dec). Sp. gr. 2.497.
Use: Oxidizing agent.

potassium chloroiridate. See iridium potassium chloride.

potassium chloroplatinate (platinum potassium chloride; potassium platinichloride) K_2PtCl_6 .
Properties: Small, orange-yellow crystals or powder.
Insoluble in alcohol; very slightly soluble in water; m.p. decomposes when heated. Sp. gr. 3.499 (24°C); decomposes at 250°C .
Derivation: By adding platinic chloride to a solution of a potassium salt and crystallizing.
Use: Photography; laboratory reagent.

potassium chromate (potassium chromate, yellow; neutral potassium chromate) K_2CrO_4 .
Properties: Yellow crystals; soluble in water; insoluble in alcohol; sp. gr. 2.7319; m.p. 971°C .
Derivation: Roasting powdered chromite with potash and limestone, treating the cinder with hot potassium sulfate solution and leaching.
Grades: Technical; reagent.
Containers: Bottles; drums.
Hazard: Toxic by ingestion and inhalation.
Uses: Reagent in analytical chemistry; aniline black; textile mordant; enamels; chromate pigments; inks; medicine; fungicide; leather finishing; chromium compounds.

potassium chromate, red. See potassium dichromate.

potassium chromium sulfate. See chromium potassium sulfate.

potassium citrate $\text{K}_3\text{C}_6\text{H}_5\text{O}_7 \cdot \text{H}_2\text{O}$.
Properties: Colorless or white crystals or powder; deliquescent; cooling saline taste; odorless. Soluble in water and glycerol; almost insoluble in alcohol. Sp. gr. 1.98; m.p., decomposes when heated to about 230°C . Nontoxic.
Derivation: Action of citric acid on potassium carbonate.
Grades: Technical; C.P.; N.F.; F.C.C.
Containers: 25- to 250-lb drums.
Uses: Medicine; sequestrant, stabilizer, buffer in foods.

potassium cobaltinitrite. See cobalt potassium nitrite.

potassium columbate. Obsolete name for potassium niobate.

potassium copper cyanide (copper potassium cyanide; potassium cuprocyanide).
Properties: White, crystalline, double salt of copper cyanide and potassium cyanide. Copper content (Cu) min 25.8%; free KCN 1.25-3.0%.
Containers: 100-lb drums.
Hazard: Highly toxic.
Uses: For preparing and maintaining cyanide copper plating baths based on potassium cyanide.
Shipping regulations: (Air) Poison label. Legal label name potassium cuprocyanide.

potassium copper ferrocyanide. See copper potassium ferrocyanide.

potassium cupric ferrocyanide. See copper potassium ferrocyanide.

potassium cuprocyanide. Legal label name (Air) for potassium copper cyanide (q.v.).

potassium cyanate KOCN .
Properties: Colorless crystals; sp. gr. 2.05; decom-

poses $700-900^\circ\text{C}$. Soluble in water; insoluble in alcohol.

Derivation: Heating potassium cyanide with lead oxide.

Uses: Herbicide; manufacture of organic chemicals and drugs; treatment of sickle cell anemia.

potassium cyanide KCN .

Properties: White, amorphous, deliquescent lumps or crystalline mass; faint odor of bitter almonds. Soluble in water, alcohol and glycerol. Sp. gr. 1.52 (16°C); m.p. 634°C .

Derivation: Absorption of hydrocyanic acid in potassium hydroxide.

Grades: Commercial; pure; solution; reagent.

Containers: 25-, 100-lb drums.

Hazard: Highly toxic; absorbed by skin. Tolerance (as CN), 5 mg per cubic meter of air.

Uses: Extraction of gold and silver from ores; reagent in analytical chemistry; insecticide; fumigant; manufacture of various intermediate organic cyanogen derivatives.

Shipping regulations: (solid and solution) (Rail, Air) Poison label. Legal label name (Rail) Cyanide of potassium.

potassium cyanoargenate. See silver potassium cyanide.

potassium cyanoaurite. See potassium gold cyanide.

potassium cyclamate. See sodium cyclamate.

potassium di-n-butyl dithiocarbamate $(\text{C}_4\text{H}_9)_2\text{NCSSK}$.
A 50% aqueous solution is a straw-colored liquid; sp. gr. 1.08-1.12. Used as an ultra-accelerator for natural and synthetic latexes.

potassium dichloroisocyanurate $\text{Cl}_2\text{K}(\text{NCO})_3$. A cyclic compound. See also dichloroisocyanuric acid.
Properties: White; slightly hygroscopic; crystalline powder or granules; loose bulk density (approx) powder 37 lb/cu ft, granular 64 lb/cu ft. Active ingredient approx 59% available chlorine, decomp. at 240°C .

Containers: 200-lb fiber drums.

Hazard: Dangerous fire risk in contact with organic materials. Strong oxidizing agent. Toxic by ingestion.

Uses: Household dry bleaches, dishwashing compounds, scouring powders, detergent-sanitizers; replacement for calcium hypochlorite.

Shipping regulations: (Dry, containing more than 39% available chlorine) (Rail) Yellow label. (Air) Oxidizer label.

potassium dichromate (potassium bichromate; red potassium chromate) $\text{K}_2\text{Cr}_2\text{O}_7$.

Properties: Bright, yellowish red transparent crystals; bitter, metallic taste. Soluble in water; insoluble in alcohol. Sp. gr. 2.676 (25°C); m.p. 396°C ; b.p., decomposes at 500°C .

Derivation: By adding sulfuric acid to crude potassium chromate solution.

Grades: Commercial; highest purity; highest purity fused; reagent.

Containers: 100-lb bags; 400-lb drums.

Hazard: Toxic by ingestion and inhalation. Dangerous fire risk in contact with organic materials. Strong oxidizing agent. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Oxidizing agent (chemicals, dyes, intermediates); analytical reagent; brass pickling compositions; electroplating; pyrotechnics; explosives; safety matches; textiles; dyeing and printing; glass; chrome

glues and adhesives; chrome tanning leather; wood stains; poison fly paper; process engraving and lithography; photography; pharmaceutical preparations; synthetic perfumes; chrome alum manufacture; pigments; alloys; ceramic products.

potassium dihydrogen phosphate. See potassium phosphate, monobasic.

potassium dimethyldithiocarbamate. See sodium dimethyldithiocarbamate.

potassium diphosphate. See potassium phosphate, monobasic.

potassium dithionate (potassium hyposulfate) $K_2S_2O_6$. Properties: Colorless crystals; soluble in water; insoluble in alcohol. Sp. gr. 2.2.78.
Use: Reagent.

potassium endothall (dipotassium salt of endothall, q.v.). The water solution is an amber liquid, used as a contact herbicide.

potassium ethyldithiocarbonate. See potassium xanthate.

potassium ethylxanthate. See potassium xanthate.

potassium ethylxanthogenate. See potassium xanthate.

potassium ferric oxalate $K_3Fe(C_2O_4)_3 \cdot 3H_2O$. Properties: Monoclinic green crystals; loses 3 molecules water at $100^\circ C$; decomposes $230^\circ C$; soluble in water, acetic acid; incompatible with alkali and ammonia, since these react to precipitate ferric hydroxide.
Use: Photography and blue-printing.

potassium ferricyanide (red prussiate of potash; red potassium prussiate) $K_3Fe(CN)_6$.

Properties: Bright red, lustrous crystals or powder. Soluble in water; slightly soluble in alcohol. Sp. gr. 1.85 ($25^\circ C$).

Derivation: Chlorine is passed into a solution of potassium ferrocyanide, the ferricyanide separating out. Grades: Pure crystals; pure powder; reagent; technical. Containers: 25-, 100-, 350-lb drums.

Hazard: Decomposes on strong heating to evolve highly toxic fumes, but the compound itself has low toxicity. Uses: Tempering steel; etching liquid; production of pigments; electroplating; sensitive coatings on blue-print paper; fertilizer compositions; laboratory reagent.

potassium ferrocyanide (yellow prussiate of potash; yellow potassium prussiate) $K_4Fe(CN)_6 \cdot 3H_2O$.

Properties: Lemon yellow crystals or powder; mild saline taste; effloresces on exposure to air. Soluble in water; insoluble in alcohol. Sp. gr. 1.853 ($17^\circ C$); m.p., loses its water of crystallization when heated to $70^\circ C$; b.p., decomposes.

Derivation: From nitrogenous waste products, iron filings and potassium carbonate.

Grades: Technical; C.P.

Containers: Drums; multiwall paper sacks.

Hazard: On heating to red heat it evolves highly toxic fumes, but the compound itself has low toxicity. Uses: Medicine; potassium cyanide and ferricyanide; dry colors; tempering steel; dyeing; explosives; process engraving and lithography; laboratory reagent.

potassium fluoborate (potassium borofluoride) KBF_4 . Properties: Colorless crystals; sp. gr. 2.498 ($20^\circ C$); decomp. $350^\circ C$; very slightly soluble in water; insoluble in alcohol, ether, alkalis.

Derivation: By the reaction of boric acid, hydrofluoric acid, and potassium hydroxide.

Containers: Fiber drums.

Uses: Sand-casting of aluminum and magnesium; grinding aid in resinoid grinding wheels; flux for soldering and brazing; electrochemical processes and chemical research.

potassium fluoride (a) KF ; (b) $KF \cdot 2H_2O$.

Properties: White, crystalline, deliquescent powder; sharp saline taste. Soluble in water and hydrofluoric acid; insoluble in alcohol. Sp. gr. (a) 2.454, (b) 2.454. M.p. (a) $846^\circ C$; b.p. $1505^\circ C$.

Derivation: By saturation of hydrofluoric acid with potassium carbonate.

Grades: Technical; free of arsenic; C.P.

Containers: Polyethylene bottles; drums.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Etching glass; preservative; insecticide; production of fluorine.

Shipping regulations: (Air) (solid) No label required; (solution) Corrosive label.

potassium fluosilicate (potassium silicofluoride) K_2SiF_6 .

Properties: White odorless, crystalline powder; sp. gr. 3.0; slightly soluble in water; soluble in hydrochloric acid.

Containers: 100-, 200-, 400-lb and in bulk.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Vitreous enamel frits; synthetic mica; metallurgy of aluminum and magnesium; ceramics; insecticide.

potassium fluotantalate. See tantalum potassium fluoride.

potassium fluozirconate. See zirconium potassium fluoride.

potassium germanium fluoride. See germanium potassium fluoride.

potassium gibberellate. Salt of gibberellic acid (q.v.). Used to promote and control development of malt in grain.

potassium gluconate $KC_6H_{11}O_7$.

Properties: Odorless, salty tasting, fine white crystalline powder. Soluble in water; insoluble in alcohol and benzene. Low toxicity.

Derivation: Reaction of potassium hydroxide or carbonate with gluconic acid.

Grade: Pharmaceutical.

Use: Medicine (vitamin tablets).

potassium glutamate (monopotassium L-glutamate) $KOOC(CH_2)_3CH(NH_2)COOH \cdot H_2O$.

Properties: White, practically odorless, free-flowing powder. Hygroscopic; freely soluble in water; slightly soluble in alcohol; pH of a 2% solution 6.9–7.1. Low toxicity.

Grade: F.C.C.

Uses: Flavor enhancer; salt substitute.

potassium glycerophosphate (potassium glycerophosphate) $K_2C_3H_5O_2 \cdot H_2PO_3 \cdot 3H_2O$.

Properties: Pale yellow syrupy liquid; acid taste. Soluble in alcohol; miscible with water in all proportions. Nontoxic.

Derivation: Glycerol and phosphorus pentoxide or

metaphosphoric acid are mixed, warmed and exactly neutralized with potassium carbonate, warmed and concentrated.

Grades: Technical, 50 or 75% solution; F.C.C. (syrup or solution).

Uses: Food additive and dietary supplement.

potassium gold chloride (potassium aurichloride; potassium chloroaurate; gold potassium chloride) $\text{KAuCl}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Yellow crystals. Soluble in water, alcohol and ether.

Derivation: By neutralizing chloroauric acid with potassium carbonate.

Uses: Photography; painting porcelain and glass; medicine.

potassium gold cyanide (potassium cyanoaurite; gold potassium cyanide) KAu(CN)_2 .

Properties: White, crystalline powder. Soluble in water; slightly soluble in alcohol; insoluble in ether.

Derivation: Action of hydrocyanic acid on potassium aurate.

Hazard: Highly toxic.

Uses: Medicine; electrogilding.

Shipping regulations: (Rail, Air) Cyanides or cyanide mixtures, dry, Poison label.

potassium guaiacol sulfonate $\text{C}_6\text{H}_3\text{OCH}_3\text{OHSO}_3\text{K} \cdot \frac{1}{2}\text{H}_2\text{O}$.

Properties: White powder or crystals; gradually turns pink on exposure to air and light; bitter taste, afterward becoming sweetish; odorless. Contains approx. 60% guaiacol. Soluble in water; sparingly soluble in alcohol. Low toxicity.

Grade: N.F.

Containers: 25- to 300-lb drums.

Uses: Medicine; laboratory reagent.

potassium 2,4-hexadienoate. See potassium sorbate.

potassium hexafluorophosphate KPF_6 .

Properties: Solid; m.p. 575°C (approx); b.p. decomposes. Soluble in water.

Grade: 98-100%.

Uses: Maintenance of fluoride atmospheres; preparation of bactericides and fungicides; laboratory reagent.

potassium hexanitrocobaltate III. See cobalt potassium nitrite.

potassium hexyl xanthane $\text{C}_6\text{H}_{13}\text{OCSSK}$. Used as a flotation agent.

potassium hydrate. See potassium hydroxide.

potassium hydride KH . Marketed as a semidispersion of gray powder in oil.

Properties: The solid decomposes on heating or in contact with moisture.

Hazard: Dangerous fire and explosion risk by reaction with water; evolves toxic and flammable gases on heating and on exposure to moisture.

Uses: Organic condensations and alkylations.

See also hydride.

potassium hydrogen fluoride. See potassium bifluoride.

potassium hydrogen phosphate. See potassium phosphate, dibasic.

potassium hydrogen phthalate. $\text{HOOC}_6\text{H}_4\text{COOK}$.

Properties: Colorless crystals. Soluble in water; sp. gr. 1.636.

Derivation: Potassium hydroxide and phthalic anhydride.

Grades: C.P., analytical.

Use: Alkalimetric standard.

potassium hydrogen sulfate. See potassium bisulfate.

potassium hydrosulfide (potassium sulfhydrate; potassium bisulfide) KHS .

Properties: Yellow crystals; hydrogen sulfide odor.

When exposed to air, forms the polysulfide. Hygroscopic. Soluble in alcohol. Sp. gr. 1.69; m.p. 455°C .

Decomposes in water. Low toxicity.

Grade: Technical.

Use: Separation of heavy metals.

potassium hydroxide (caustic potash; potassium hydrate; lye) KOH .

Properties: White, deliquescent pieces, lumps, sticks, pellets, or flakes having a crystalline fracture. Keep well stoppered; absorbs water and carbon dioxide from the air. Soluble in water, alcohol, glycerin; slightly soluble in ether. Sp. gr. 2.044; m.p. 405°C , but varies with water content.

Derivation: Electrolysis of concentrated potassium chloride solution.

Method of purification: Sulfur compounds are removed by the addition of potassium nitrate to the fused caustic. The purest form is obtained by solution in alcohol, filtration and evaporation.

Grades: Commercial; ground; flake; fused (88 to 92%); purified by alcohol (sticks, lumps and drops); reagent; highest purity; U.S.P.; liquid (45%); F.C.C. Containers: Bottles; boxes; kegs; drums; tank cars.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Soap manufacture; bleaching; manufacture of potassium carbonate and tetrapotassium pyrophosphate; electrolyte in alkaline storage batteries and some fuel cells; absorbent for carbon dioxide and hydrogen sulfide; dyestuffs; liquid fertilizers; food additive; herbicides.

Shipping regulations: (solid and solution) (Air) Corrosive label. (Rail) White label. Legal label name, Caustic potash, liquid.

potassium hypophosphite (potassium hypophosphite, monobasic) KH_2PO_2 .

Properties: White opaque crystals or powder with pungent saline taste, very deliquescent. Soluble in water and alcohol; decomposed by heat. Low toxicity.

Derivation: Interaction of calcium hypophosphite and potassium carbonate.

Containers: Drums.

Hazard: Moderate fire risk. May explode if ground with nitrates or other strong oxidizing agents.

Use: Medicine.

potassium hyposulfate. See potassium dithionate.

potassium hyposulfite. See potassium thiosulfate.

potassium iodate KIO_3 .

Properties: White, crystalline powder. Odorless; soluble in water, sulfuric acid (dilute); insoluble in alcohol. Sp. gr. 3.9; m.p. 560°C (partial decomposition). Low toxicity.

Grades: Technical; C.P.; F.C.C.

Uses: Analysis (testing for zinc and arsenic); iodometry; medicine; reagent; feed additive; in foods as maturing agent and dough conditioner.

potassium iodide KI .

Properties: White crystals, granules or powder; strong bitter saline taste. Soluble in water, alcohol, acetone, and glycerol. Sp. gr. 3.123; m.p. 686°C ; b.p. 1330°C . Low toxicity.

Grades: Reagent; U.S.P.; single crystals; F.C.C.

Containers: Bottles; drums.

Uses: Medicine; reagent in analytical chemistry; pho-

- tography (precipitating silver); feed additive; spectroscopy, infrared transmission, scintillation; dietary supplement (up to 0.01% in table salt).
- potassium iridium chloride.** See iridium potassium chloride.
- potassium laurate** $\text{KOCC}_{11}\text{H}_{23}$.
Properties: Light tan paste; soluble in water and alcohol.
Uses: Emulsifying agent; base for liquid soaps and shampoos.
- potassium linoleate** $\text{KOCC}_{17}\text{H}_{31}$.
Properties: Light tan paste; soluble in water.
Use: Emulsifying agent.
- potassium magnesium sulfate.** $\text{K}_2\text{SO}_4 \cdot 2\text{MgSO}_4$.
Properties: White tetragonal crystals; sp. gr. 2.829; m.p. 927°C.
Use: Fertilizer.
- potassium manganate** K_2MnO_4 .
Properties: Dark green powder or crystals; soluble in potassium hydroxide solution and water; decomposes in acid solution. M.p. 190°C (decomposes).
Derivation: Fusion of pyrolusite (q.v.) with potassium hydroxide.
Grade: Technical.
Hazard: Moderately toxic. Dangerous fire risk in contact with organic materials. Strong oxidizing agent.
Uses: Bleaching skins, fibers, oils; disinfectants; mordant (wool); batteries; photography; printing; source of oxygen (dyeing); water purification; oxidizing agent.
- potassium mercuric iodide.** See mercuric potassium iodide.
- potassium metaarsenite.** See potassium arsenite.
- potassium metabisulfite (potassium pyrosulfite)** $\text{K}_2\text{S}_2\text{O}_5$.
Properties: White granules or powder; pungent, sharp odor; sp. gr. 2.3; decomposes at 150–190°C; oxidizes in air and moisture to sulfate; slightly soluble in water and alcohol. Low toxicity.
Derivation: By heating potassium bisulfite until it loses water.
Grades: Technical; reagent; F.C.C.
Containers: Bottles; drums.
Uses: Antiseptic reagent in analytical chemistry; source of sulfurous acid; brewing (cleaning casks and vats); wine-making (kills only undesirable yeasts and bacteria); food preservative; developing agent (photography); process engraving and lithography; dyeing; antioxidant.
- potassium, metallic, liquid alloy.** A flammable mixture or alloy of potassium and another metal which is liquid at ordinary temperature. See, for example, NaK.
Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not accepted on passenger planes.
- potassium metaphosphate (monopotassium metaphosphate)** KPO_3 , or $(\text{KPO}_3)_x$.
Properties: White powder; soluble in acids (dilute); slightly soluble in water.
- potassium molybdate** K_2MoO_4 .
Properties: White, microcrystalline powder; deliquescent; soluble in water; insoluble in alcohol; sp. gr. 2.91 (18°C); m.p. 919°C.
Use: Reagent.
- potassium monophosphate.** See potassium phosphate, dibasic.
- potassium muriate.** See potassium chloride.
- potassium naphthenate.**
Properties: Gray paste; soluble in water. Combustible.
Derivation: From naphthenic acids.
Uses: Driers; emulsifying agents.
- potassium nickel sulfate.** See nickel potassium sulfate.
- potassium nitrate (niter; nitre; saltpeter)** KNO_3 .
Properties: Transparent, colorless or white crystalline powder or crystals; slightly hygroscopic; pungent, saline taste. Sp. gr. 2.1062; m.p. 337°C; b.p., decomposes at about 400°C. Soluble in water; slightly soluble in alcohol and glycerin. Low toxicity.
Grades: Commercial; C.P.; F.C.C.
Containers: Bottles; bags; barrels; drums.
Hazard: Dangerous fire and explosion risk when shocked or heated, or in contact with organic materials; strong oxidizing agent.
Uses: Pyrotechnics; explosives; matches; specialty fertilizer; reagent; to modify burning properties of tobacco; glass manufacture; metallurgy; oxidizer in solid rocket propellants; food preservative; color fixative in meats; anaphrodisiac.
Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.
- potassium nitrite** KNO_2 .
Properties: White or slightly yellowish prisms or sticks; deliquescent. Sp. gr. 1.915; b.p., explodes at 1000°F; m.p. above 300°C. Soluble in water; insoluble in alcohol.
Grades: C.P.; technical; reagent; F.C.C.
Hazard: Dangerous fire and explosion risk when shocked or heated, or in contact with organic materials; strong oxidizing agent.
Uses: Analysis (testing for amino acids, cobalt, iodine, urea); medicine; organic synthesis.
Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.
- potassium oleate** $\text{C}_{17}\text{H}_{33}\text{COOK}$.
Properties: Gray-tan paste; soluble in water and alcohol. Combustible.
Uses: Textile soaps; emulsifying agent.
- potassium orthophosphate.** See potassium phosphate, monobasic, dibasic or tribasic.
- potassium orthotungstate.** See potassium tungstate.
- potassium osmate (potassium perosmate)** $\text{K}_2\text{OsO}_4 \cdot 2\text{H}_2\text{O}$.
Properties: Violet crystals. Hygroscopic. Soluble in water; insoluble in alcohol and ether.
Hazard: Moderately toxic.
Use: Determination of nitrogenous matter in water.
- potassium oxalate** $\text{K}_2\text{C}_2\text{O}_4 \cdot \text{H}_2\text{O}$.
Properties: Colorless transparent crystals. Odorless; soluble in water; efflorescent in warm dry air; sp. gr. 2.08; m.p., decomposes when heated.
Derivation: Potassium formate or carbonate mixed with a small quantity of oxalate and a slight excess of alkali is heated, the oxalate extracted with water and crystallized.
Grades: Technical; C.P.
Containers: Bottles; drums.
Hazard: Toxic by inhalation and ingestion.
Uses: Reagent in analytical chemistry; source of ox-

alic acid; bleaching and cleaning; removing stains from textiles; photography.

potassium oxide K_2O .

Properties: Gray, crystalline mass. Soluble in water; forms potassium hydroxide. Soluble in alcohol and ether. Sp. gr. 2.32 (0°C); decomposes 350°C.

Derivation: By heating potassium nitrate and metallic potassium.

Uses: Reagent and intermediate.

potassium oxyfluoroborate. See niobium potassium oxyfluoride.

potassium palladium chloride. See palladium potassium chloride.

potassium penicillin G (benzylpenicillin potassium) $C_{16}H_{17}KN_2O_4S$.

Properties: Colorless or white crystals or powder; odorless; moderately hygroscopic; solutions dextrorotatory; relatively stable to air and light; very soluble in water, in saline, and in dextrose solutions; moderately soluble in alcohol; pH of solution (30 mg/ml) is 5.0–7.5; m.p. 214–217°C (dec).

Grade: U.S.P.

Use: Medicine (antibiotic).

potassium penicillin V. See potassium phenoxymethylpenicillin.

potassium percarbonate $K_2C_2O_6 \cdot H_2O$.

Properties: Granular, white mass. Keep away from light and moisture. Soluble in water (liberates oxygen). M.P. 200–300°C.

Grade: Technical.

Hazard: Strong irritant to tissue. Strong oxidizing agent. Fire risk in contact with organic materials.

Uses: Analysis (testing for cerium, chromium, vanadium, titanium); microscopy; oxidizing agent; photography; textile printing.

potassium perchlorate $KClO_4$.

Properties: Colorless crystals or white, crystalline powder. Decomposed by concussion, organic matter, and agents subject to oxidation. More stable than potassium chlorate. Soluble in water; slightly soluble in alcohol. Sp. gr. 2.524; m.p. 610°C.

Grades: Technical; reagent; ordnance.

Containers: Drums.

Hazard: Strong oxidizing agent. Fire risk in contact with organic materials.

Uses: Explosives; medicine; oxidizing agent; photography; pyrotechnics and flares; reagent; oxidizer in solid rocket propellants; inflating agent in automobile safety air bags.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

potassium periodate KIO_4 .

Properties: Small, colorless crystals or white, granular powder; slightly soluble in water. Sp. gr. 3.168; m.p. 582°C (explodes at 1076°F).

Grades: Technical; C.P.; reagent.

Hazard: Toxic; strong irritant to tissue. Strong oxidizing agent. Fire risk in contact with organic materials.

Use: Analysis (oxidizing agent).

potassium permanganate $KMnO_4$.

Properties: Dark purple crystals; blue metallic sheen; sweetish, astringent taste; odorless. Soluble in water, acetone and methanol; decomposed by alcohol. Sp. gr. 2.7032; m.p., decomposes at 240°C. Oxidizing material.

Derivation: (a) By oxidation of the manganate in an alkaline electrolytic cell. (b) A hot solution of the

manganate is treated with carbon dioxide; on cooling, the solution deposits crystals of the permanganate.

Grades: Technical; C.P.; U.S.P.

Containers: Bottles; drums.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue. Dangerous fire risk in contact with organic materials. Powerful oxidizing agent.

Uses: Oxidizer; disinfectant; deodorizer; bleach; dye; tanning; radioactive decontamination of skin; reagent in analytical chemistry; medicine; manufacture of organic chemicals; air and water purification.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

potassium peroxide K_2O_2 .

Properties: Yellow, amorphous mass; decomposes in water, evolving oxygen. M.p. 490°C.

Derivation: Oxidation of potassium in oxygen.

Hazard: Dangerous fire and explosion risk in contact with organic materials. Strong oxidizing agent. Irritant to skin and tissue.

Uses: Oxidizing agent; bleaching agent; oxygen-generating gas masks.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label. Not acceptable on passenger planes.

potassium peroxydisulfate. See potassium persulfate.

potassium peroxymonosulfate. See "Oxone."

potassium persulfate (potassium peroxydisulfate) $K_2S_2O_8$.

Properties: White crystals; soluble in water; insoluble in alcohol; sp. gr. 2.477; m.p., decomposes below 100°C.

Derivation: By electrolysis of a saturated solution of potassium sulfate.

Containers: Glass bottles; drums; polyethylene-lined paper bags.

Hazard: Moderately toxic; strong irritant and oxidizing agent. Dangerous fire risk in contact with organic materials.

Uses: Bleaching; oxidizing agent; reducing agent in photography; antiseptic; soap manufacture; analytical reagent; polymerization promoter; pharmaceuticals; modification of starch; flour-maturing agent; desizing of textiles.

Shipping regulations: (Air) Oxidizer label.

potassium alpha-phenoxymethylpenicillin (potassium penicillin 152; potassium phenethicillin; phenethicillin) $KC_{17}H_{19}N_2O_5S$. Synthetically prepared; a mixture of two stereoisomers.

Properties: White, crystalline solid; moderately hygroscopic; decomposes above 220°C. Very soluble in water; resistant to acid decomposition.

Preparation: By N-acylation of alpha-phenoxymethylpenicillic acid and G-aminopenicillanic acid (produced by fermentation using *Penicillium chrysogenum*).

Grade: N.F.

Use: Antibiotic.

potassium phenoxymethylpenicillin (potassium penicillin V) $KC_{16}H_{17}N_2O_5S$.

Properties: White, odorless, crystalline powder; very soluble in water; slightly soluble in alcohol; insoluble in acetone.

Grade: U.S.P.

Use: Antibiotic.

potassium phosphate, dibasic (DKP; potassium hydrogen phosphate; potassium monophosphate; dipotassium orthophosphate) K_2HPO_4 .

Properties: Deliquescent white crystals or powder.

Very soluble in water and alcohol; is converted to the pyrophosphate by ignition. Low toxicity.
 Derivation: Action of phosphoric acid on potassium carbonate.
 Grades: Commercial; pure; highest purity; N.F.; F.C.C.
 Containers: Glass bottles; fiber drums.
 Uses: Buffer in antifreezes; ingredient of "instant" fertilizers; nutrient for penicillin culturing; humectant; pharmaceuticals; in foods as a buffer, sequestrant, and yeast food; laboratory reagent.

potassium phosphate, monobasic (MKP; potassium acid phosphate; potassium diphosphate; potassium orthophosphate; potassium dihydrogen phosphate) KH_2PO_4 .
 Properties: Colorless crystals. Acid in reaction. Soluble in water; insoluble in alcohol; sp. gr. 2.338; m.p. 253°C. Low toxicity.
 Derivation: Action of phosphoric acid on potassium carbonate.
 Grades: Technical; C.P.; F.C.C.
 Containers: Glass bottles; barrels; multiwall paper bags.
 Uses: Medicine; baking powder; nutrient solutions; yeast foods; buffer and sequestrant in foods; laboratory reagent.

potassium phosphate, tribasic (potassium phosphate, neutral; potassium phosphate normal; tripotassium orthophosphate; potassium phosphate; tertiary; tri-potassium phosphate) $\text{K}_3\text{PO}_4 \cdot \text{H}_2\text{O}$ or K_3PO_4 .
 Properties: Granular white powder. Hygroscopic. Soluble in water giving strongly basic solution; insoluble in alcohol. M.P. (anhydrous) 1340°C; sp. gr. (anhydrous) 2.564 (17°C).
 Grades: Reagent; technical; F.C.C.
 Containers: 275-, 300-, 400-lb drums.
 Uses: Purification of gasoline; water-softening; liquid soaps; fertilizer; in foods as an emulsifier; laboratory reagent.

potassium phosphite, monobasic KH_2PO_3 .
 Properties: White powder; hygroscopic. Soluble in water; insoluble in alcohol. Slowly oxidized by air to phosphate.

potassium platinichloride. See potassium chloroplatinate.

potassium polymetaphosphate $(\text{KPO}_3)_n$. The molecular weight may be as high as 500,000. See sodium metaphosphate.
 Properties: White odorless powder; insoluble in water; soluble in sodium salt solutions, which may have high viscosity. Low toxicity.
 Derivation: Dehydration of monobasic potassium phosphate.
 Grades: Technical; F.C.C.
 Uses: Fat emulsifier and moisture-retaining agent in foods.

potassium polysulfide K_2S_x .
 Properties: Crystals; soluble in water and alcohol.
 Hazard: Toxic by ingestion. Irritant to skin and eyes. Moderate fire risk.
 Use: Fungicide.

potassium prussiate, red. See potassium ferricyanide.

potassium prussiate, yellow. See potassium ferrocyanide.

potassium pyroantimonate $\text{K}_2\text{H}_2\text{SbO}_7 \cdot 4\text{H}_2\text{O}$ (approx).
 Properties: White crystalline powder or granules;

slightly soluble in cold water; readily soluble in hot water. Insoluble in alcohol.
 Grades: Reagent; technical.
 Uses: Starch sizes and flame-retarding compounds.

potassium pyroborate. See potassium tetraborate.

potassium pyrophosphate (TKPP; tetrapotassium pyrophosphate; potassium pyrophosphate, normal) $\text{K}_4\text{P}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.
 Properties: Colorless crystals or white powder; somewhat hygroscopic in air (deliquesces above a relative humidity of 40-45%). Similar to tetrasodium pyrophosphate except for greater solubility; sp. gr. 2.33; dehydrated below 300°C; m.p. 1090°C. Soluble in water; insoluble in alcohol. Low toxicity.
 Grades: Technical; 99.4%; 60% solution; F.C.C.
 Containers: Fiber drums; multiwall paper bags.
 Uses: Soap and detergent builder; sequestering agent; peptizing and dispersing agent.

potassium pyrosulfate (potassium acid sulfate, anhydrous) $\text{K}_2\text{S}_2\text{O}_7$.
 Properties: Colorless needles or white, crystalline powder, or fused pieces. Soluble in water; converted to potassium bisulfate. Sp. gr. 2.512 (25/4°C); m.p. (approx) 325°C.
 Use: Acid flux in analysis; laboratory reagent.

potassium pyrosulfite. See potassium metabisulfite.

potassium rhodanide. See potassium thiocyanate.

potassium ricinoleate $\text{C}_{17}\text{H}_{33}\text{OHCOOK}$.
 Properties: White paste; soluble in water. Combustible.
 Use: Emulsifying agent.

potassium silicate
 Properties: (solid) Weight ratio $\text{SiO}_2:\text{K}_2\text{O}$ varies with grade, as 2.1:1; 2.5:1. Colorless, anhydrous lump, shattered or granular; soluble in water only at elevated temperatures and pressure. (Solution) Colorless liquid. Bé range 29-48°.
 Derivation: Supercooled melt of potassium carbonate and pure silica sand.
 Containers: (solid) Drums. (solution) Cans; drums; tank cars and tank trucks.
 Uses: (solid) Manufacture of glass and refractory material; welding rods; potassium silicate solutions. (Solution) Nonefflorescing base for inorganic protective coatings; coating for roofing granules and welding rods; binder in the manufacture of carbon arc-light electrodes and for phosphors on television tubes; detergents; catalyst; adhesives.

potassium silicofluoride. See potassium fluosilicate.

potassium sodium carbonate. See sodium potassium carbonate.

potassium sodium ferricyanide $\text{K}_2\text{NaFe}(\text{CN})_6$.
 Properties: Red crystals, over 99% pure; m.p., decomposes; nonhygroscopic and stable; easily soluble in water.
 Derivation: From ferrocyanides.
 Containers: Fiber drums.
 Uses: Blueprint paper and photography.

potassium-sodium phosphate. See sodium-potassium phosphate.

potassium-sodium tartrate (Rochelle salt; sodium potassium tartrate) $\text{KNaC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$. It is a salt of L(+)-tartaric acid.
 Properties: Colorless transparent efflorescent crystals

or white powder having cool, saline taste. Soluble in water; insoluble in alcohol. Loses water of crystallization at 140°C; unstable above about 225°C. Sp. gr. 1.77; m.p. 70–80°C. Nontoxic.

Derivation: Potassium acid tartrate is dissolved in water, the solution saturated with sodium carbonate, concentrated after purification and crystallized.

Grades: Highest purity; reagent; commercial crystals or powder; N.F.; F.C.C.

Containers: 25-, 225-, 250-lb drums.

Uses: Sequestrant and general-purpose food additive; baking powders; medicine (cathartic); component of Fehling's solution.

potassium sorbate (potassium 2,4-hexadienoate)

$\text{CH}_3\text{CH}:\text{CHCH}:\text{CHCOOK}$.

Properties: White powder; m.p. 270°C (decomposes); 58.5% soluble in water (25°C); sp. gr. 1.36 (25/20°C). Nontoxic.

Containers: Cartons; fiber drums.

Grades: Technical; F.C.C.

Uses: Bacteriostat and antioxidant in foods; preservative in wines, sausage casings, margarine, etc.

potassium stannate $\text{K}_2\text{SnO}_3 \cdot 3\text{H}_2\text{O}$.

Properties: White to light tan crystals. Soluble in water; insoluble in alcohol. Sp. gr. 3.197.

Grade: Technical.

Containers: 100-, 350-lb drums.

Hazard: Toxic. Tolerance (as Sn), 2 mg per cubic meter of air.

Uses: Textiles (dyeing and printing); alkaline tin-plating bath.

potassium stearate $\text{C}_{17}\text{H}_{35}\text{COOK}$.

Properties: White crystalline powder; soluble in hot water; slightly soluble in alcohol; slight odor of fat. Nontoxic.

Grades: Commercial, contains considerable palmitate; F.C.C.

Uses: Base for textile softeners.

potassium strontium chlorate. See strontium potassium chlorate.

potassium styphnate $\text{KC}_6\text{H}_2\text{N}_3\text{O}_8 \cdot \text{H}_2\text{O}$.

Properties: Yellow prisms; m.p., loses water at 120°C; b.p., explodes.

Hazard: Explodes when shocked or heated.

Use: High explosive.

Shipping regulations: (Rail) Consult regulations. (Air) Not acceptable.

potassium sulfate K_2SO_4 .

Properties: Colorless or white, hard crystals or powder; bitter, saline taste. Soluble in water; insoluble in alcohol. Sp. gr. 2.66; m.p. 1072°C.

Derivation: (a) By treatment of potassium chloride either with sulfuric acid or with sulfur dioxide, air, and water (Hargreaves process). (b) By fractional crystallization of a natural sulfate ore; (c) from salt lake brines.

Grades: Highest purity medicinal; commercial; crude; C.P.; agricultural.

Containers: Bags; drums.

Uses: Reagent in analytical chemistry; medicine; gypsum cements; fertilizer for chloride-sensitive crops such as tobacco and citrus; alum manufacture; glass manufacture; food additive.

potassium sulfhydrate. See potassium hydrosulfide.

potassium sulfide K_2S .

Properties: Red or yellow-red crystalline mass or fused solid; deliquescent in air. Soluble in water, al-

cohol, and glycerin; insoluble in ether. Sp. gr. 1.805 (20/4°C); m.p. 840°C.

Derivation: Potassium sulfate and carbon are heated in a tightly closed crucible to a moderate temperature.

Grade: Technical.

Containers: Cans; glass bottles; metal drums.

Hazard: Flammable, dangerous fire risk. May ignite spontaneously; explosive in form of dust or powder.

Uses: Reagent in analytical chemistry; depilatory; medicine.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label.

potassium sulfite $\text{K}_2\text{SO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals or powder. Soluble in water; sparingly soluble in alcohol. Decomposes on heating and slowly oxidizes in air. Low toxicity.

Grades: Technical; C.P.; F.C.C.

Uses: Medicine; photography; preservative and antioxidant in foods.

potassium sulfocarbonate (potassium trithiocarbonate) K_2CS_3 .

Properties: Yellowish-red crystals. Very hygroscopic. Soluble in alcohol and water.

Grade: Technical.

Uses: Analysis (testing for cobalt, nickel); medicine.

potassium sulfocyanate. See potassium thiocyanate.

potassium sulfocyanide. See potassium thiocyanate.

potassium tantalum fluoride. See tantalum potassium fluoride.

potassium tartrate $\text{K}_2\text{C}_4\text{H}_4\text{O}_6 \cdot \frac{1}{2}\text{H}_2\text{O}$.

Properties: Colorless, crystalline; soluble in water; insoluble in alcohol; decomposed by heat. Sp. gr. 1.98; decomposes 200–220°C. Nontoxic.

Grades: C.P.; technical.

Uses: Manufacture of potassium salts; medicine; laboratory reagent.

potassium tellurite K_2TeO_3 .

Properties: Granular, white powder. Hygroscopic. Soluble in water. Decomposes at 460–470°C.

Use: Analysis (testing for bacteria).

potassium tetraborate (potassium pyroborate; potassium borate) $\text{K}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$.

Properties: White powder; alkaline taste. Soluble in water.

potassium tetrathiocyanodiammonochromate. See Reinecke salt.

potassium thiocyanate (potassium rhodanide; potassium sulfocyanate; potassium sulfocyanide) KCNS .

Properties: Colorless, transparent, hygroscopic, odorless crystals; soluble in water, alcohol and acetone. Saline, cooling taste. Sp. gr. 1.88; m.p. 173°C; turns brown, green, blue when fused, white again on cooling. B.p., decomposes at 500°C.

Derivation: By heating potassium cyanide with sulfur.

Grades: Commercial; pure; reagent; A.C.S.

Containers: Glass bottles; drums.

Hazard: Moderately toxic by ingestion.

Uses: Reagent in analytical chemistry; manufacture of sulfocyanides; thioureas; printing and dyeing textiles; photographic restrainer and intensifier; synthetic dyestuffs; medicine.

potassium thiosulfate (potassium hyposulfite) $\text{K}_2\text{S}_2\text{O}_3$ with varying proportions of water of crystallization.

Properties: Colorless crystals. Hygroscopic. Soluble in water.

Grades: Technical; C.P.
Use: Analytical reagent.

potassium titanate K_2TiO_3 (approx).

Properties: White salt; hydrolyzes in water to give a strongly alkaline solution.

Derivation: From titanate acid and potassium hydroxide.

Containers: Cartons.

Use: See potassium titanate fiber.

potassium titanate fiber. Approximate composition $K_2O \cdot (TiO_2)_n$, where n is 4 to 7.

Properties: M.p. 2500°F; high refractive index; can diffuse and reflect infrared radiation.

Uses: Rockets, missiles, nuclear-powered applications as an insulator, especially for the range 1300–2100°F.

potassium titanium fluoride. See titanium potassium fluoride.

potassium titanium oxalate. See titanium potassium oxalate.

potassium trichlorophenate $Cl_3C_6H_2OH$. Offered as a solution containing 47% potassium trichlorophenate, and 3% other potassium chlorophenates; sp. gr. 1.3; f.p. $-9^\circ C$.

Use: Slime control agent for pulp and paper mill systems.

potassium tripolyphosphate (KTPP) $K_5P_3O_{10}$.

Properties: White crystalline solid; m.p. 620–640°C; sp. gr. 2.54; loose bulk density (approx) 67 lb/cu/ft; solubility in water (26°C), over 140 g/100 ml water.

Containers: Bags; fiber drums.

Uses: Water-treating compounds; cleaners; specialty fertilizers; sequestrant (including food preparation).

potassium trithiocarbonate. See potassium sulfocarbonate.

potassium tungstate (potassium orthotungstate; potassium wolframate) $K_2WO_4 \cdot 2H_2O$.

Properties: Heavy, crystalline powder; sp. gr. 3.1; m.p. 921°C. Deliquescent. Soluble in water; insoluble in alcohol.

potassium undecylenate $CH_2=CH(CH_2)_9COOK$.

Properties: Finely divided white powder; decomposes above 250°C; limited solubility in most organic solvents; soluble in water.

Hazard: May be toxic in high concentrations.

Uses: Bacteriostat and fungistat in cosmetics and pharmaceuticals.

potassium wolframate. See potassium tungstate.

potassium xanthate (potassium ethyldithiocarbonate; potassium xanthogenate; potassium ethyl xanthate; potassium ethylxanthogenate) $KS_2COC_2H_5$.

Properties: Colorless or light yellow crystals; soluble in water and alcohol; insoluble in ether; sp. gr. 1.558 (21.5°C).

Derivation: Reaction of potassium ethylate and carbon disulfide.

Containers: Glass bottles; fiber cans.

Uses: Fungicide for soil treatment; reagent in analytical chemistry.

potassium zinc iodide (zinc potassium iodide) $ZnI_2 \cdot KI$.

Properties: Colorless crystals; very hygroscopic.

Use: Analysis (testing for alkaloids).

potassium zinc sulfate. See zinc potassium sulfate.

potassium zirconifluoride. See zirconium potassium fluoride.

potassium zirconium chloride. See zirconium potassium chloride.

potassium zirconium sulfate. See zirconium potassium sulfate.

potentiator. A term used in the flavor and food industries to characterize a substance that intensifies the taste of a food product to a far greater extent than does an enhancer. The most important of these are the 5'-nucleotides, which appeared on the market in 1963. They are approved by FDA. Their effective concentration is measured in parts per *billion*, whereas that of enhancers such as MSG is in parts per thousand. The effect is thought to be due to synergism. Potentiators do not add any taste of their own, but intensify the taste response to substances already present in the food. See also enhancer; seasoning; flavor.

"Potter's" Compounds.³⁰⁹ Trademark for drawing lubricants and compounds for nonferrous and space age materials. Basic formulations vary from water-soluble soaps through fortified synthetic oil types.

potting compound. See encapsulation.

pour point. (1) The lowest temperature at which a liquid will flow when a test container is inverted. (2) The temperature at which an alloy is cast.

pour point depressant. An additive for lubricating and automotive oils which lowers the pour point (or increases the flow point) by approximately 20°F. The agents now generally used are polymerized higher esters of acrylic acid derivatives. They are most effective with low-viscosity oils.

powder. Any solid, dry material of extremely small particle size ranging down to colloidal dimensions, prepared either by comminuting larger units (mechanical grinding), by combustion (carbon black, lampblack), or by precipitation from a chemical reaction (calcium carbonate, etc.). Powders that are so fine that the particles cannot be detected by rubbing between thumb and forefinger are called impalpable. Typical materials used in powder form are cosmetics, inorganic pigments, metals, plastics (molding powders), dehydrated dairy products, pharmaceuticals, and explosives. Metal powders are used to make specialized equipment by sintering and pressing (powder metallurgy), as well as for sprayed coatings and paint pigments (aluminum, bronze). Thermoplastic polymers in powder form are used in a technology known as powder molding, and thermosetting polymers are used in the sprayed coatings field for autos, machinery and other industrial applications, in which they have many advantages over sprayed solvent coatings.

See also metal, powdered; carbon black; black powder.

powder metallurgy. See metal, powdered; sintering.

"Poxeal."¹¹⁶ Trademark for an insulation system for motor and generator coils whereby the electrical circuits are sealed in a tough flexible material (such as epoxy resin) capable of withstanding severe environmental and thermal shock conditions.

Ppb. Abbreviation for parts per billion.

ppm. Abbreviation for parts per million, used to indicate extremely minute concentrations of particulates in liquids and gases.

"PPO."²⁴⁵ Trademark for polyphenylene oxide.

Properties: Excellent engineering thermoplastic. Light beige, opaque; sp. gr. 1.06; Rockwell hardness (R scale), 118–120; tensile modulus at 73°F 3.6 to 3.8 × 10⁵ psi; self-extinguishing; useful temperature range of more than 600°F; excellent mechanical properties and dielectric characteristics; soluble in most aromatic and chlorinated hydrocarbons; insoluble in alcohols, ketones, aliphatic hydrocarbons, and water. Highly resistant to hydrolysis, acids, bases, and detergents.

Derivation: Oxidative polymerization of 2,6-dimethylphenol in the presence of a copper-amine-complex catalyst.

Uses: Dielectric components; hospital and laboratory equipment; pump housings, impellers, pipe, valves and fittings required by chemical and food industries; substitute for die-cast metals; nose cones for space vehicles.

"PP-2000 Series."²¹⁰ Trademark for polyvinyl pyridines used as dye mordant and antistat tablet coating.

"PQ Soluble Silicates."²⁰¹ Trademark for a group of chemicals produced by varying the proportions of sodium or potassium oxide, silica and water. Includes sodium and potassium silicates, metasilicates, sesquisilicates, and orthosilicates.

Uses: Adhesives, soap builders, detergents, cleaning compounds, cements, binders, sizes, protective coatings and films, coagulant aids for raw and waste water, rust inhibitors, catalyst base and deflocculants.

Pr (1) Symbol for praseodymium.

(2) Informal abbreviation for propyl.

"Pramitol."²¹⁹ See "Prometone."

"Pranone."³²¹ Trademark for ethisterone.

"Prantal" Methylsulfate.³²¹ Trademark for a brand of diphenamyl methylsulfate.

Prandtl number. For any substance, the ratio of the viscosity to the thermal conductivity. The lower the number, the higher is the convection capacity of the substance. This ratio is important in heat and chemical engineering calculations.

praseodymia. See praseodymium oxide; see also rare earths.

praseodymium **Pr** Element of atomic number 59; Group IIIB of the periodic table; one of the rare earth elements of the lanthanide group. Atomic weight 140.9077; valences 3,4. No stable isotopes.

Properties: Yellowish metal, tarnishes easily (color of salts green); sp. gr. 6.78–6.81; m.p. 930°C; b.p. 3020°C; ignites to oxide (200–400°C); liberates hydrogen from water; soluble in dilute acids; paramagnetic; nontoxic.

Forms and grades: Ingots; rods; sheets; 98.8 to 99.9+% pure.

Source: Monazite, cerite, and allonite; also fission product.

Derivation: Reduction of the trifluoride with an alkaline metal, or by electrolysis of the fused halides.

Uses: Praseodymium salts; ingredient of mischmetal (q.v.); core material for carbon arcs; colorant in glazes and glasses; catalyst; phosphors, lasers and masers.

See also didymium.

praseodymium oxalate $\text{Pr}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$. Green powder; insoluble in water; slightly soluble in acids.

Used in ceramics.

Containers: Glass bottles, fiber drums.

praseodymium oxide (praseodymia) Pr_2O_3 . Yellow-green powder; sp. gr. 7.07. Insoluble in water; soluble in acids. Hygroscopic, absorbs carbon dioxide from air. Purities to 99.8% oxide. Combustible; low toxicity.

Uses: Glass and ceramic pigment; laboratory reagent.

precipitate. Small particles that have settled out of a liquid or gaseous suspension by gravity, or that result from a chemical reaction; precipitated compounds such as blanc fixe (barium sulfate) are prepared in this way, for example, by the reaction $\text{BaCl}_2 + \text{Na}_2\text{SO}_4 \rightarrow \text{BaSO}_4 + 2\text{NaCl}$. A class of organic pigments called lakes are made by precipitating an organic dye onto an inorganic substrate. Colloidal particles dispersed in a gas, as flue dust in industrial stacks, can be precipitated by introducing an electric charge opposite to that which sustains the particles (see Cottrell).

See also sedimentation.

precision investment casting. See lost wax process.

precursor. In biochemistry, an intermediate compound or molecular complex present in a living organism; when activated physiochemically it is converted to a specific functional substance. The prefix "pro-" is usually used to indicate that the compound in question is a precursor. Examples are ergosterol (pro-vitamin D₂) which is activated by ultraviolet radiation to vitamin D; carotene (pro-vitamin A) is a precursor of Vitamin A; prothrombin forms thrombin upon activation in the blood-clotting mechanism.

prednisolone $\text{C}_{21}\text{H}_{28}\text{O}_5$. Delta¹⁻⁴-Pregnadiene-11β, 17α, 21-triol-3,20-dione. Generic name for an analog of hydrocortisone.

Properties: White to practically white, odorless, crystalline powder. Very slightly soluble in water; soluble in alcohol, chloroform, acetone, methanol, dioxane. M.p. about 235°C with some decomposition.

Grade: U.S.P.

Hazard: Causes sodium retention. May have side effects similar to cortisone.

Use: Medicine. Also available as acetate and sodium phosphate.

prednisone $\text{C}_{21}\text{H}_{26}\text{O}_5$. Delta¹⁻⁴-Pregnadiene-17α,21-diol-3,11,20-trione. Generic name for an analog of cortisone.

preferential. Descriptive of the selectivity of action, either chemical or physicochemical, exhibited by a substance when in contact with two other substances; it may be due either to chemical affinity or to surface phenomena. An example of a preferential chemical combination is that of hemoglobin with carbon monoxide, with which it unites 200 times as readily as with oxygen when exposed to a mixture of the two; such phenomena as adsorption, corrosion, and the wetting of dry powders by liquids are other examples.

pregnanediol $\text{C}_{21}\text{H}_{36}\text{O}_2$. 5β-Pregnane-3α,20α-diol. A steroid; the metabolic product of progesterone.

Properties: Crystallizes in plates from acetone; m.p. 238°C; dextrorotatory in solutions; sparingly soluble in organic solvents; not precipitated by digitonin.

Derivation: Isolation from pregnancy urine of women, cows, mares, and chimpanzees; by reduction of pregnanedione.

Uses: Synthesis of progesterone; medically as a pregnancy test.

pregnenedione. See progesterone.

pregneninolone. See ethisterone.

4-pregnen-21-ol-3,20-dione. See deoxycorticosterone.

pregnenolone $C_{21}H_{32}O_2$. Δ^5 -Pregnene-3 β -ol-20-one. A steroid which is a biologically active hormone similar to progesterone and the adrenal steroid hormones.

Properties: Crystallizes in needles from dilute alcohol; m.p. 193°C; freely soluble in acetone, petroleum ether, benzene, and carbon tetrachloride.

Derivation: From stigmastanol or other steroids.

Uses: Medicine; biochemical research.

Also available as acetate salt.

"Preludin."²¹⁹ Trademark for a brand of phenmetrazine hydrochloride.

"Premerge."²³³ Trademark for a dinitro weed killer.

premix molding. Mixtures of plastic ingredients prepared in advance of the molding or extruding operation and stored in bags or bins until required. They are made by mixing the components (resin, filler, fibrous materials such as glass, and necessary curatives) in a dough blender. Storage life may be from a few days to a year or more, depending on formulation. Such mixtures are then calendered or extruded after warming to suitable temperature.

prenitene (1,2,3,4-tetramethylbenzene; prenitrol)

$(CH_3)_4C_6H_2$.

Properties: Colorless liquid; soluble in alcohol; insoluble in water. Sp. gr. 0.901; b.p. 204°C; f.p. -7.7°C.

prepolymer. An adduct or reaction intermediate of a polyol and a monomeric isocyanate, in which either component is in considerable excess of the other. A polymer of medium molecular weight having reactive hydroxyl and -NCO groups. It is used in preparation of polyurethane coatings and foams.

pregreg. A term used in the reinforced plastics field to mean the reinforcing material containing or combined with the full complement of resin before molding.

"Preptone."⁸⁴ Trademark for sodium bromite desizing compound for textiles.

"Pre-San."³²⁹ Trademark for a selective herbicide. See N-(2-mercaptoethyl)benzenesulfonamide S-(O,O-diisopropyl phosphorodithioate).

preservative. Any substance or mixture that prolongs the life of an organic material, either by admixture in low concentrations, by impregnating, by coating, or by immersion. Examples are such food additives as benzoic acid; antioxidants used in petroleum products, rubber and plastics; fungicides for textiles; paint on wood; and various alcohols and aldehydes used to prevent deterioration of biological specimens, e.g., formaldehyde. See also antioxidant; protective coating.

"Prestabit Oil" V. Trademark for an anionic textile chemical consisting of purified sulfated castor-oil fatty acids.

Uses: Dyeing assistant for cotton and wool fiber; in viscose manufacture, clarifying agent to prevent milkiness of the yarn; antistatic agent for acetate and polyacrylonitrile fibers.

"Prestone."²¹⁴ Trademark for a group of automotive service products which include an ethylene glycol

base antifreeze, containing special inhibitors for prevention of corrosion, foaming, creepage and rust-loosening. See also antifreeze.

Priestley, Joseph (1733-1804). Born near Leeds, England, Priestley originally planned to enter the ministry. As a youth, he became interested in both physics and chemistry and his research soon established his position as a scientist. He was elected to the Royal Society in 1766. His greatest contribution to science was his discovery of oxygen in 1774. He emigrated from England to Northumberland, Pa., where he lived from 1784 to his death. His research in America resulted in the discovery of carbon monoxide (1799). In 1874, at a meeting at Priestley's old home convened to celebrate the centennial of the discovery of oxygen, plans were laid to organize the American Chemical Society, which later established the Priestley medal, one of the highest awards in chemistry. (See Avogadro).

prills. Small round or acicular aggregates of a material, usually a fertilizer, that are artificially prepared. In the explosives field prills-and-oil consists of 94% coarse, porous ammonium nitrate prills and 6% fuel oil. See also explosives, high.

"Primaflow."²³ Trademark for a series of organic polyelectrolyte products used for flocculating suspended solids in water, waste and process streams. See also polyelectrolyte.

"Primal."²³ Trademark for aqueous dispersions of acrylic resins, supplied in various grades that differ in hardness and flexibility, produce finishes which are water-insoluble, require no plasticizer for flexibility, unimpaired by aging, and adhere tenaciously to leather and lacquer coats.

primary. (1) In reference to monohydric alcohols, amines, and a few related compounds, this term, together with secondary and tertiary, describes the molecular structure of isomeric or chemically similar individuals. Monohydric alcohols are based on the

methanol group, $\begin{array}{c} | \\ -C-OH \end{array}$, in which three of the

bonds of the methanol carbon may be attached either to hydrogen atoms or to alkyl groups. A primary alcohol has one alkyl group and two hydrogens, e.g.,

$\begin{array}{c} H \\ | \\ CH_3-C-OH \end{array}$, except methyl alcohol, in which all

three bonds are to hydrogen atoms. A secondary alcohol has two alkyl groups and one hydrogen, e.g.,

$\begin{array}{c} CH_3 \\ | \\ CH_3-C-OH \\ | \\ H \end{array}$. A tertiary alcohol has three alkyl

groups, e.g., $\begin{array}{c} CH_3 \\ | \\ CH_3-C-OH \\ | \\ CH_3 \end{array}$. The three types can be

readily identified by the number of hydrogen atoms attached to the central (methanol) carbon atom: if it is 2 or more, the alcohol is primary; if 1, it is secondary; and if zero, it is tertiary. For example, CH_3CH_2OH is primary; $(CH_3)_2CHOH$ is secondary; $(CH_3)_3COH$ is tertiary.

Primary, secondary and tertiary amines are formed from ammonia (NH_3) when one, two, or three hydrogen atoms, respectively, are replaced by alkyl groups.

These terms are also used to name salts of orthophosphoric acid (H_3PO_4) in which one, two, or three of the hydrogen atoms have been replaced by metal or radicals: NaH_2PO_4 is primary sodium phosphate, Na_2HPO_4 is secondary sodium phosphate. The same system of names is used for salts of other acids containing three replaceable hydrogen atoms.

(2) A type of battery that is irreversible in respect to power output; a voltaic cell. A secondary battery (storage battery) is reversible and can be recharged.

(3) In the terminology of minerals, primary (in the case of metals) refers to direct production from the ore; in the case of petroleum it refers to production from wells by direct means. This meaning contrasts with the term "secondary," used to denote recovery of metal from scrap and, for petroleum, recovery by means of special techniques such as flooding and hydraulic pressure.

primary azo dyes. Azo dyes derived from primary amines.

primary calcium phosphate. See calcium phosphate, monobasic.

"Primol."⁵¹ Trademark for high viscosity white mineral oils conforming to U.S.P. specifications for internal use.

primuline dye. See thiazole dye.

printing ink. A viscous to semisolid suspension of finely divided pigment in a drying oil such as heat-bodied linseed oil. Alkyd, phenol-formaldehyde or other synthetic resins are frequently used as binders; and cobalt, manganese, and lead soaps are added to catalyze the oxidative drying reaction. Some types of inks dry by evaporation of a volatile solvent rather than by oxidation and polymerization of a drying oil or resin. For further information refer to National Printing Ink Institute, Lehigh University, Bethlehem, Pa.

pristane (2,6,10,14-tetramethylpentadecane; norphytane) $\text{C}_{19}\text{H}_{40}$. Found in rock specimens 2.5 to 3 billion years old. Is known to be synthesized only by living organisms, and to withstand heat and pressure; thus it serves to date the existence of life on earth. See also phytane.

Properties: Colorless, faintly odored, transparent, stable, homogeneous liquid; b.p. 290°C ; f.p. approx. -60°C ; sp. gr. 0.775–0.795 (20°C); refractive index 1.435–1.440 (20°C); flash point 175°C . Soluble in most organic solvents. Combustible.

Grade: 90% purity.

Containers: 100-lb drums.

Uses: Precision lubricant; chromatographic oil; anti-corrosion agent.

"Probrit."⁴²⁸ Trademark for a line of zinc addition agents for both cyanide and acid plating solutions.

"Procadian."¹⁹⁷ Trademark for a solid urea product used as a supplement in animal feeding.

procaine hydrochloride (procaine)

$\text{C}_8\text{H}_9\text{NH}_2\text{COOCH}_2\text{CH}_2\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{HCl}$.

Properties: Small, colorless crystals or white, crystalline powder; odorless; stable in air. Soluble in water and in alcohol at 25°C ; slightly soluble in chloroform; almost insoluble in ether; solutions acid to litmus. M.p. $153\text{--}156^\circ\text{C}$.

Derivation: (a) By heating chloroethyl-para-nitrobenzoic ester with diethylamine for 24 hours under pressure at 120°C . The product is then reduced with tin and hydrochloric acid. (b) By condensation of ethylene chlorohydrin with diethylamine. The chloroethyldiethylamine formed is heated with sodium para-aminobenzoate.

Containers: Drums.

Grade: U.S.P.

Hazard: Moderately toxic by ingestion and inhalation.

Use: Medicine (local anesthetic).

procaine penicillin G $\text{C}_{16}\text{H}_{18}\text{N}_2\text{O}_4\text{S} \cdot \text{C}_{13}\text{H}_{20}\text{N}_2\text{O}_2 \cdot \text{H}_2\text{O}$.

Properties: White, fine crystals or powder; odorless; relatively stable to air and light; solutions dextrorotatory; sparingly soluble in water; slightly soluble in alcohol; fairly soluble in chloroform.

Grade: U.S.P.

Use: Antibiotic; animal feed additive.

process industry. See chemical process industry.

"Procinyl"³²⁵ Trademark for reactive disperse dyes for nylon. Cover irregular-dyeing yarns, and produce dyeings have excellent wet fastness.

"Procion"³²⁵ Trademark for a range of dyes which form a chemical linkage with cellulosic fiber molecules. Applied to cotton and rayon by dyeing and printing.

"Prodag."⁴⁶ Trademark for a dispersion of graphite in water. Used as a mold wash for aluminum permanent molds, ingot molds and molds for mechanical rubber goods; stop-off coating.

prodrug. A term applied in the pharmaceutical chemistry to a chemical compound that is converted into an active curative agent by metabolic processes within the body. See also precursor.

producer gas. A gas obtained by burning coal or coke with a restricted supply of air, or by passing air and steam through a bed of incandescent fuel under such conditions that the carbon dioxide formed is converted into carbon monoxide. The water vapor reacts to form carbon monoxide and hydrogen. Producer gas is cheap but has low Btu and is used where transportation is not required.

A typical gas from coke may analyze, in percent:

Carbon monoxide	25.3
Hydrogen	13.2
Methane	0.4
Carbon dioxide	5.4
Oxygen	0.6
Nitrogen	55.2

Hazard: Highly flammable and toxic. Explosive range 20 to 73% in air.

See also water gas; synthesis gas.

"Product BCO."²⁸ Trademark for a surface-active agent based on C-cetyl betaine. An amphoteric product showing cationic properties in acid solutions and anionic properties in alkaline solutions. Particularly effective in alkaline peroxide bleaching systems.

"Product BDO."²⁸ Trademark for a surface-active agent based on C-decyl betaine. Similar to "Product BCO." Effective in solutions containing high concentrations of electrolytes.

"Pro-fax."²⁶⁶ Trademark for polypropylene molding powders. The 6000 Series is propylene homopolymer and 7000 Series, propylene copolymer. Can be precision-injection molded; blown; extended into

film or sheet, into monofilament or multifilament, onto wire, or in profile forms; vacuum-formed, and machined. There are over 300 different grades and types.

"Proform."³¹⁹ Trademark for vitamin B₁₂ feed supplements.

"Profil."³³⁹ Trademark for glass fiber-reinforced polypropylene.

profile. See sil.

proflavine sulfate (proflavine; 3, 6-diaminoacridinium hydrogen sulfate) C₁₃H₁₁N₃ · H₂SO₄.

Properties: Reddish brown, odorless crystalline powder. Soluble in water and alcohol forming brownish solutions which fluoresce green on dilution, nearly insoluble in ether and chloroform.

Use: Medicine.

"Profume."²³³ Trademark for an odorized methyl bromide product, used as a soil fumigant and insecticide.

progesterone (delta⁴-pregnene-3,20-dione) C₂₁H₃₀O₂. The female sex hormone secreted in the body by the corpus luteum, by the adrenal cortex, or by the placenta during pregnancy. It is important in the preparation of the uterus for pregnancy, and for the maintenance of pregnancy. It exists in two crystalline forms (alpha- and beta-) of equal physiological activity. Progesterone is believed to be the precursor of the adrenal steroid hormones. Low toxicity.

Properties: White crystalline powder; odorless and stable in air but sensitive to light. M.p., alpha form 128–133°C, beta form, about 121°C. Practically insoluble in water, soluble in alcohol, acetone, and dioxane; sparingly soluble in vegetable oils.

Units: The international unit (IU) of progestational activity is expressed as 1 mg of progesterone.

Derivation: Isolation from corpus luteum of pregnant sows; synthesis from other steroids such as stigmasterol (q.v.).

Grade: N.F.

Use: Medicine; permissible food additive; oral contraceptive; laboratory reagent.

proguanil (chlorguanide; 1-*p*-chlorophenyl-5-isopropyl biguanide). An antimalarial drug said to be less toxic than others.

"Progynon."³²¹ Trademark for estradiol.

prolactin. See luteotropin.

prolamin. See gliadin.

"Prolase."¹⁷³ Trademark for a proteolytic enzyme.

proline (2-pyrrolidinecarboxylic acid) C₄H₈NCOOH. A nonessential amino acid found naturally in the L(-) form.

Properties: Colorless crystals; soluble in water and alcohol; insoluble in ether; optically active; DL-proline; m.p. 205°C with decomposition.

D(+)-proline; m.p. 215–220°C with decomposition.

L(-)-proline; m.p. 220–222°C with decomposition.

Derivation: Hydrolysis of protein; also synthetically.

Uses: Biochemical and nutritional research; microbiological tests; culture media; dietary supplement; laboratory reagent. Available commercially as the L(-)-proline.

prolipin. A compound sterile solution of protein obtained from nonpathogenic bacteria, various animal fats and lipoids derived from bile.

"Proluton."³²¹ Trademark for progesterone.

"Promacetin."³³⁰ Trademark for acetosulfone.

promazine hydrochloride (10-(3-dimethylaminopropyl)-phenothiazine hydrochloride) C₁₇H₂₀N₂S · HCl. Isomeric with promethazine hydrochloride.

Properties: White to slightly yellow, practically odorless, crystalline powder. Oxidizes upon prolonged exposure to air and acquires a blue or pink color. Melts within a range of 3° between 172° and 182°C; pH of 5% solution between 4.2 and 5.2. Low toxicity.

Grade: N.F.

Use: Medicine; permissible food additive.

promethium Pm Radioactive rare-earth element, a member of the lanthanide series; atomic number 61; atomic weight 145. The 145 isotope has a half-life of 18 years; 147 half-life 2.64 years. The latter is the only form available.

Properties: Silvery-white metal; m.p. 1160°C; density 7.2 g/cc.

Derivation: The 147 isotope is recovered from spent uranium fission products; also by reduction of the chloride or fluoride with an alkali metal.

Hazard: Strong radioactive poison; requires shielding and glove-boxes.

Uses: (147 isotope) Nuclear auxiliary power generators; special semiconductor battery; luminescent paint for watch dials; x-ray source; thickness gauges; with tungsten as cermet for space power system (withstands 2000°C for 1000 hours).

Note: Some 30 compounds are known, but are not commercially available.

"Prometone."²¹⁹ Trademark for 2-methoxy-4,6-bis-(isopropylamino)-s-triazine. Available as "Pramitol" 25E, 25% emulsifiable solution, and "Pramitol" 5P, 5% pellets.

Hazard: Toxic by ingestion and inhalation.

Use: Herbicide.

"Promin."³³⁰ Trademark for sodium glucosulfone injection.

promoter. (1) A substance which, when added in relatively small quantities to a catalyst, increases its activity, e.g., aluminum and potassium oxide are added as promoters to the iron catalyst used in facilitating combination of hydrogen and nitrogen to form ammonia. (2) In ore flotation, a substance which provides the minerals to be floated with a water-repellent surface that will adhere to air bubbles. Such reagents are generally more or less selective towards minerals of certain classes.

"Pro-Noxfish."³⁴² Trademark for fish-toxicant composition containing rotenone and sulfoxide in emulsifiable vehicles.

proof. The ethyl alcohol content of a liquid at 60°F, stated as twice the percent of ethyl alcohol by volume. One gallon of 95% alcohol is therefore equivalent to 1.9 gallons proof alcohol. In the U.S., the alcohol tax is based on the number of proof gallons.

propadiene. See allene.

"Propaloid-T."²³⁶ Trademark for a creamy white organic-modified, beneficiated magnesium montmorillonite with a rapid hydration characteristic. Used as a viscosity control, stabilizer for emulsions and suspensions in aqueous systems. Primarily for use in paints, cosmetics and paper coatings.

propanal. See propionaldehyde.

propane (dimethylmethane) C_3H_8 .

Properties: Colorless gas. Natural gas odor. Non-corrosive. B.p. $-42.5^\circ C$; f.p. $-189.9^\circ C$; density of liquid at $0^\circ C$ 0.531; density of vapor at $0^\circ C$ (air = 1) 1.56; flash point $-156^\circ F$. Autoignition temp. $874^\circ F$. Soluble in ether, alcohol; slightly soluble in water. An asphyxiant gas.

Grades: Technical; research (99.9%).

Derivation: From petroleum and natural gas.

Containers: Cylinders; tank cars.

Hazard: Highly flammable; dangerous fire risk. Explosive limits in air 2.4 to 9.5%. For storage, see butane (note).

Uses: Organic synthesis; household and industrial fuel; manufacture of ethylene; extractant; solvent; refrigerant; gas enricher; aerosol propellant; mixture for bubble chambers.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. Label name: Liquefied petroleum gas.

1,3-propanediamine. See 1,3-diaminopropane.

1,2-propanediol. See 1,2-propylene glycol.

1,3-propanediol. See trimethylene glycol.

propane hydrate. See gas hydrate.

propanenitrile. See ethyl cyanide.

1-propanethiol (n-propyl mercaptan). C_3H_7SH .

Properties: Offensive-smelling liquid; boiling range $67.73^\circ C$; sp. gr. (20/ $4^\circ C$) 0.8408; refractive index (20/D) 1.4380; flash point $-5^\circ F$.

Grade: 95%.

Containers: Drums; tank cars.

Hazard: Highly flammable, dangerous fire risk.

Uses: Chemical intermediate; herbicide.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

propanil. Generic name for 3,4-dichloropropionanilide $Cl_2C_6H_3NHCOCH_2CH_3$.

Properties (pure): Light brown solid; m.p. $85-89^\circ C$; (technical): Liquid, b.p. $91-91.5^\circ C$.

Hazard: May be toxic.

Use: Post-emergence herbicide, especially for rice culture.

propanoic acid. See propionic acid.

1-propanol. See propyl alcohol.

2-propanol. See isopropyl alcohol.

propanolamine. See 2-amino-1-propanol; 3-amino-1-propanol.

2-propanol nitrate. See isopropyl nitrate.

2-propanolpyridine $C_3NH_4C_3H_6OH$.

Properties: Colorless liquid. B.p. $260.2^\circ C$; sp. gr. (25/ $^\circ C$) 1.060; refractive index 1.5298 (n 20/D); miscible with water in all proportions at $20^\circ C$.

4-propanolpyridine $C_3NH_4C_3H_6OH$.

Properties: Colorless liquid. B.p. $289.0^\circ C$; f.p. $36.7^\circ C$; sp. gr. (40/ $^\circ C$) 1.053; soluble in water.

2-propanone. See acetone.

2-propanone oxime. See acetoxime.

propanoyl chloride. See propionyl chloride.

propargyl alcohol (2-propyn-1-ol) $HC\equiv CCH_2OH$.

Properties: Colorless liquid; geranium-like odor; sp. gr. 0.9215; f.p. $-17^\circ C$; b.p. $114^\circ C$; soluble in water,

alcohol, and ether; immiscible with aliphatic hydrocarbons. Flash point (open cup) $97^\circ F$.

Derivation: From acetylene by high-pressure synthesis.

Grades: Technical; 75% solution.

Containers: Up to tank cars.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Tolerance, 1 ppm in air. Flammable, moderate fire risk.

Uses: Chemical intermediate; corrosion inhibitor; laboratory reagent; solvent stabilizer; prevents hydrogen embrittlement of steel; soil fumigant.

propargyl bromide (3-bromo-1-propyne) $HC\equiv CCH_2Br$.

Properties: Liquid; sp. gr. 1.520; b.p. $88-90^\circ C$. Flash point $65^\circ F$ (COC). Sharp odor.

Derivation: From acetylene by high-pressure synthesis.

Containers: Up to tank cars.

Hazard: Flammable, dangerous fire risk. Toxic and irritant.

Uses: Chemical intermediate; soil fumigants.

Shipping regulations: (Rail, Air) Flammable Liquid label.

propargyl chloride (3-chloro-1-propyne) $HC\equiv CCH_2Cl$.

Properties: Liquid; freezing point $-76.9^\circ C$; b.p. range $56.0-57.1^\circ C$; refractive index (n 25/D) 1.4310; flash point $90-95^\circ F$.

Derivation: From acetylene by high-pressure synthesis.

Containers: Up to tank cars.

Hazard: Probably toxic. Flammable. Moderate fire risk.

Uses: Chemical intermediate; soil fumigant.

"Propasol"²¹⁴ Trademark for a series of solvents for water-based enamels.

propazine 80W. Generic name for a pre-emergence herbicide containing 80% 2-chloro-4,6-bis(isopropylamino)-s-triazine. Used especially for weed control in sorghum culture.

propellant. (1) A rocket fuel (q.v.). (2) A compressed gas used to expel the contents of containers in the form of aerosols. Until recently chlorofluorocarbons 11 and 12 have been widely used because of their non-flammability and nontoxicity. The strong possibility that they may contribute to depletion of the ozone layer of the upper atmosphere has resulted in reduction of their use for this purpose. Other propellants used are hydrocarbon gases such as butane and propane, carbon dioxide and nitrous oxide. The materials dispersed include insecticides, shaving cream, whipped cream and cosmetic preparations. See also ozone (note).

2-propenal. See acrolein.

propene. See propylene.

propanenitrile. See acrylonitrile.

2-propene-1-thiol. See allyl mercaptan.

propene-1,2,3-tricarboxylic acid. See aconitic acid.

propenoic acid. See acrylic acid.

2-propen-1-ol. See allyl alcohol.

propenyl alcohol. See allyl alcohol.

2-propenylamine. See allylamine.

para-propenylanisole. See anethole.

alpha-propenyldichlorohydrin. See alpha-dichlorohydrin.

propenyl guaethol (1-ethoxy-2-hydroxy-4-propenylbenzene) $C_2H_5OC_6H_3(OH)(C_3H_5)$.

Properties: Free-flowing white powder; odor and

taste similar to vanilla, but much more powerful; m.p. 85–86°C; very soluble in fats, edible solvents, and essential oils; very slightly soluble in water.
Uses: Artificial vanilla flavoring; flavor enhancer.

propenyl guaiacol. See methyl isoeugenol.

2-propenyl hexanoate. See allyl caproate.

2-propenyl isothiocyanate. See allyl isothiocyanate.

propiodal (1,3-bis(trimethylamino)-2-propanol diiodide; iodisan; hexamethyldiaminoisopropanol diiodide) $[\text{CH}_2\text{N}(\text{CH}_3)_3]_2\text{CHOH}$.

Properties: White, crystalline solid; m.p. about 275°C (dec). Turns brown at 240°C. Freely soluble in water, slightly in alcohol; insoluble in ether, acetone.

Uses: Medicine (iodine therapy).

beta-propiolactone (USAN) (BPL) $\text{OCH}_2\text{CH}_2\text{CO}$.

Properties: Colorless liquid; pungent odor; b.p. 155°C with rapid decomposition; f.p. –33.4°C; refractive index (n_D 20/D) 1.4131; sp. gr. (20/4°C) 1.1460; soluble in water; miscible with ethyl alcohol, acetone, ether, and chloroform at 25°C. Reacts with alcohol. Flash point (open cup) 167°F; stable when stored in glass at refrigeration temperature (+5° to +10°C). Combustible.

Derivation: Direct combination of ketene and formaldehyde.

Containers: Up to tank cars; tank trucks.

Hazard: Strong skin irritant. Causes cancer in experimental animals; worker exposure should be minimized.

Uses: Organic synthesis; vapor sterilant; disinfectant.

propionaldehyde (propanal; propyl aldehyde; propionic aldehyde) $\text{C}_3\text{H}_7\text{CHO}$.

Properties: Water-white liquid with suffocating odor; soluble in water. Flash point (open cup) 15°F; b.p. 48.8°C; f.p. –81°C; sp. gr. 0.807 (20/4°C); refractive index (n_D 20/D) 1.364. Soluble in water and alcohol. Autoignition temp. 405°F.

Derivation: (a) Oxidation of propyl alcohol with dichromate; (b) by passing propyl alcohol over copper at elevated temperatures.

Containers: Drums.

Hazard: Flammable, dangerous fire risk; explosive limits in air 3.7 to 16%. Moderately toxic and irritant.

Uses: Manufacture of propionic acid, polyvinyl and other plastics; synthesis of rubber chemicals; disinfectant; preservative.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

propionamide nitrile. See cyanoacetamide.

propione. See diethyl ketone.

propionic acid (methylacetic acid; propanoic acid) $\text{CH}_3\text{CH}_2\text{CO}_2\text{H}$.

Properties: Colorless liquid; pungent odor; sp. gr. 0.9942 (20/4°C); f.p. –20.8°C; refractive index 1.3862 (20°C); b.p. 140.7°C; soluble in water, alcohol, chloroform and ether. Flash point 130°F. Combustible. Autoignition temp. 955°F.

Derivation: By reaction of ethyl alcohol with carbon monoxide, using a boron trifluoride catalyst; also by the reaction of carbon monoxide with hydrogen and olefins or alcohols.

Method of purification: Rectification.

Grades: Technical, 99.0%; F.C.C.

Containers: Drums; carboys; tank cars.

Hazard: Moderate fire risk; strong irritant.

Uses: Propionates, some of which are used as mold inhibitors in bread and fungicides in general; herbicides; preservative for grains and wood chips; emulsifying agents; solutions for electroplating nickel; perfume esters; artificial fruit flavors; pharmaceuticals; cellulose propionate plastics.

Shipping regulations: (Air) Corrosive label.

propionic aldehyde. See propionaldehyde.

propionic anhydride $(\text{CH}_3\text{CH}_2\text{CO})_2\text{O}$.

Properties: Colorless liquid; pungent odor; f.p. –45°C; b.p. 167–169°C; sp. gr. 1.0119 at 20°C; vapor pressure 1 mm at 20°C; flash point 165°F; wt 8.4 lb/gal at 20°C; soluble in alcohol, ether, chloroform, and alkalies; insoluble in water. Combustible.

Hazard: Strong irritant to tissue.

Uses: Esterifying agent for fats, oils, cellulose; dehydrating medium for nitrations and sulfonations; alkyl resins, dyestuffs and pharmaceuticals.

Shipping regulations: (Air) Corrosive label.

propionitrile. See ethyl cyanide.

propionylbenzene. See propiophenone.

propionyl chloride (propanoyl chloride) $\text{CH}_3\text{CH}_2\text{COCl}$.

Properties: Colorless liquid with pungent odor; f.p. –94°C; b.p. 80°C; sp. gr. 1.065 (20/4°C). Decomposes in water; soluble in alcohol.

Use: Chemical intermediate.

propionyl peroxide $\text{C}_2\text{H}_5\text{C}(\text{O})\text{OOC}(\text{O})\text{C}_2\text{H}_5$. Available as a 25% solution in a high-boiling hydrocarbon; flash point 125°F. Used as an initiator in polymerization reactions, such as the high pressure polymerization of ethylene.

Hazard: Strong oxidizing agent. May explode if shocked or heated.

Shipping regulations: (Rail) Oxidizing material, n.o.s., Yellow label. (Air) Organic peroxide label.

propiophenone (ethyl phenyl ketone; propionylbenzene; 1-phenylpropanone-1) $\text{C}_6\text{H}_5\text{COC}_2\text{H}_5$.

Properties: Water-white to light amber liquid with strong persistent odor; sp. gr. 1.012 (20/20°C); refractive index (n_D 20/D) 1.527; congealing temperature 17.5–21°C; b.p. 218°C; flash point (TOC) 210°F. Insoluble in water, ethylene glycol, glycerine; miscible with ethyl ether, benzene, and toluene. Combustible.

Containers: Drums.

Uses: Fixative in perfumes; starting material for synthesis of ephedrine and other important pharmaceuticals and synthetic organic chemicals; laboratory reagent.

"Propi-Rhap."²⁴⁸ Trademark for the 2-ethylhexyl ester of 2-(2,4-dichlorophenoxy)propionic acid.

Use: Herbicide.

Hazard: May be toxic.

propoxyphene (4-dimethylamino-3-methyl-1,2-diphenyl-2-diphenyl-2-butanol propionate) $\text{C}_{22}\text{H}_{29}\text{NO}_2$. The *alpha*-diastereoisomers are optically active and are preferred for their greater pain-relieving ability. The drug has about the same analgesic effect as codeine and is not considered addictive; it does have a narcotic effect which can be harmful in cases of overdose. Recommendations for restriction of its use have been made by FDA.

Derivation: (1) Action of alkalis on (a) propylene glycol or (b) propylene chlorohydrin; (2) Oxidation of propylene; (3) Epoxidation of propylene by a hydroperoxide complex with molybdenum catalyst.

Containers: Drums; tank cars.

Hazard: Highly flammable, dangerous fire risk; explosive limits in air 2 to 22%. Tolerance, 100 ppm in air. Moderately toxic and irritant.

Uses: Polyols for urethane foams; propylene glycols; surfactants and detergents; isopropanol amines; fumigant; synthetic lubricants; synthetic elastomer (homopolymer).

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

propyl formate $\text{CH}_3\text{CH}_2\text{CH}_2\text{OOCH}$.

Properties: Liquid; sp. gr. 0.9006 (20/4°C); f.p. -92.9°C ; b.p. 81.3°C ; refractive index 1.3769 (20°C). Slightly soluble in water; miscible with alcohol and ether in all proportions. Flash point (COC) 27°F . Autoignition temp. 851°F . Low toxicity.

Hazard: Flammable, dangerous fire risk.

Use: Flavoring.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

propylformic acid. See butyric acid.

n-propyl furoate $\text{C}_4\text{H}_3\text{OCO}_2\text{C}_3\text{H}_7$.

Properties: Colorless, fragrant liquid, becomes yellow in light. Practically insoluble in water; soluble in alcohol and ether. Sp. gr. 1.0745 (25.9°C/4°C); b.p. 210.9°C (corr); refractive index 1.4737 (25.9°C/D). Low toxicity. Combustible.

Uses: Flavoring.

propyl gallate $\text{C}_3\text{H}_7\text{OOCOC}_6\text{H}_2(\text{OH})_3$. Colorless crystals; m.p. 150°C . Almost insoluble in water; somewhat soluble in oils. Low toxicity.

Containers: Polyethylene-lined fiber drums.

Hazard: Use in foods restricted to 0.02% of fat content.

Uses: Antioxidant or synergist to retard or prevent rancidity in lard and other edible fats and oils; laboratory reagent.

propylhexedrine (1-cyclohexyl-2-methylaminopropane; N-dimethylcyclohexaneethylamine)

$\text{C}_6\text{H}_{11}\text{CH}_2\text{CH}(\text{CH}_3)\text{NHCH}_3$.

Properties: Clear, colorless liquid with amine odor; b.p. $202\text{--}206^\circ\text{C}$; very slightly soluble in water; soluble in dilute acids; miscible with alcohol, chloroform, and ether. Sp. gr. 0.848–0.852. Volatilizes slowly at room temperature; absorbs carbon dioxide from the air. Solutions are alkaline to litmus.

Grade: N.F.

Use: Medicine.

propyl para-hydroxybenzoate. See propylparaben.

propyliodone (propyl 3,5-diiodo-4-oxo-1(4H)-pyridine-acetate) $\text{I}_2(\text{O})\text{C}_6\text{H}_2\text{NCH}_2\text{COOC}_3\text{H}_7$.

Properties: White, crystalline powder. Odorless or nearly so. Practically insoluble in water. Soluble in acetone, alcohol, and ether. M.p. $187\text{--}190^\circ\text{C}$.

Grade: U.S.P.

Use: Medicine (radiopaque medium).

propyl isome. Generic name for dipropyl-5,6,7,8-tetrahydro-7-methylnaphtho [2,3-d]-1,3-dioxole-5,6-dicarboxylate. $\text{C}_{20}\text{H}_{26}\text{O}_6$.

Properties: Orange liquid; insoluble in water; slightly soluble in oils; soluble in most other organic solvents.

Use: Insecticide synergist.

propylmagnesium bromide $\text{C}_3\text{H}_7\text{MgBr}$. Available as a solution in ether. A Grignard reagent.

Use: Alkylating agent in organic synthesis.

propylmalonic acid, diethyl ester (propyl diethyl malonate) $\text{C}_3\text{H}_7\text{CH}(\text{COOC}_2\text{H}_5)_2$.

Properties: Colorless liquid; fragrant odor; insoluble in water; soluble in alcohols, ethers, esters, and ketones; sp. gr. 0.9860 (25°C); b.p. 222°C .

Uses: Intermediate; tobacco flavoring.

n-propyl mercaptan. Legal label name (Air) for 1-propanethiol (q.v.).

2-n-propyl-4-methylpyrimidyl 6-N,N-dimethylcarbamate $\text{C}_3\text{H}_7\text{C}_4\text{HN}_2(\text{CH}_3)\text{OOCN}(\text{CH}_3)_2$. Liquid, miscible with water and most organic solvents.

Hazard: May be toxic.

Use: Insecticide.

n-propyl nitrate (NPN) $\text{C}_3\text{H}_7\text{NO}_3$.

Properties: White to straw-colored liquid; ethereal odor; sp. gr. 1.07 (20°C); boiling range $104\text{--}127^\circ\text{C}$; flash point 68°F . Autoignition temp. 350°F ; freezing point -100°C ; refractive index 1.3975 (n 20/D). Insoluble in water.

Grades: 96–98% pure.

Containers: 55-gal steel drums.

Hazard: Flammable, severe fire and explosion risk.

Strong oxidizing material. Explosive limits in air 2 to 100%. Tolerance, 25 ppm in air.

Use: Rocket fuel (monopropellant).

Shipping regulations: (Air) Flammable Liquid label.

propylparaben (propyl para-hydroxybenzoate)

$\text{C}_{10}\text{H}_{12}\text{O}_3$.

Properties: Colorless crystals or white powder; slightly soluble in water; soluble in alcohol, ether and acetone; m.p. $95\text{--}98^\circ\text{C}$. Low toxicity.

Grades: U.S.P., F.C.C.

Containers: Drums.

Uses: Medicine; food preservative; fungicide; mold control in sausage casings.

propyl pelargonate $\text{C}_3\text{H}_7\text{OOCOC}_8\text{H}_{17}$.

Properties: Liquid; sp. gr. 0.870 (15/15°C); b.p. 237°C . Insoluble in water; soluble in alcohol and most organic solvents. Combustible.

Uses: Flavors and perfumes; bactericides and fungicides.

propylpiperidine. See coniine.

6-propylpiperonyl butyl diethylene glycol ether. See piperonyl butoxide.

n-propyl propionate $\text{CH}_3\text{CH}_2\text{COOCH}_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid. Soluble in most organic solvents; very slightly soluble in water. Boiling range $122\text{--}124^\circ\text{C}$; f.p. -76°C ; flash point 174°F (open cup); wt 7.31 lb/gal. Combustible. Low toxicity.

Grade: Technical.

Containers: 55-gal drums; tank cars.

Uses: Solvent for nitrocellulose; paints, varnishes, lacquers; coating agents.

4-n-propylpyridine $\text{C}_8\text{H}_{11}\text{N}$ or $\text{C}_3\text{H}_7\text{C}_5\text{H}_4\text{N}$. B.p. 188°C . Used as an intermediate. Not to be confused with coniine (propylpiperidine).

propylthiouracil (6-propyl-2-thiouracil) $\text{C}_7\text{H}_{10}\text{N}_2\text{OS}$.

Properties: White powdery crystalline substance; starchlike in appearance and to touch; bitter taste; m.p. $218\text{--}221^\circ\text{C}$. Sensitive to light. Very slightly soluble in water; sparingly soluble in alcohol; soluble in ammonia and alkali hydroxides.

Derivation: By the condensation of beta-oxocaproate with thiourea.

Grade: U.S.P.

Use: Medicine.

n-propyltrichlorosilane $C_3H_7SiCl_3$.

Properties: Colorless liquid. B.p. 123.5°C; sp. gr. 1.195 (25/25°C); refractive index ($n_{25/D}$) 1.4292; flash point (C.O.C.) 100°F. Readily hydrolyzed with liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and propylmagnesium chloride.

Grade: Technical.

Hazard: Strong irritant; flammable, moderate fire risk.

Use: Intermediate for silicones.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

propyl xanthate. See xanthic acid.

propyne. See methylacetylene.

2-propyn-1-ol. See propargyl alcohol.

"Proquel."⁴²⁸ Trademark for chrome bath mist suppressants used to control mist, fumes, and spray. Concentrated, viscous liquid which can produce a foam blanket.

"Prorex Oils."³³¹ Trademark for a brand of highly-refined, light-colored, light-bodied mineral oils.

"Proslak."⁴⁸⁷ Trademark for a blended, complex fatty amide fabric softener.

prostaglandin. One of a group of physiologically active compounds derived from fatty acids having 20 carbon atoms; an approximate formula is $C_{20}H_{36}O_5$. Research on these compounds has been intense in recent years in view of their importance in various reproduction mechanisms and their effect on blood pressure. They are believed to have significant relationships to a number of hormones; they also affect the nervous system and inhibit production of gastric juice. They occur naturally in body tissues and biological fluids (especially semen). Both the chemical structure and metabolic functions of these compounds have been established with considerable accuracy, and several types have been synthesized; one pathway uses norbornadiene as a starting point followed by a ten-step sequence of conversions to a diol which serves as a precursor; another starts with cyclopentadiene, followed by hydroboration, yielding two intermediates from which prostaglandin can be derived. The most prolific source of natural prostaglandins is a marine organism called a gorgonian sea whip, which occurs in great numbers in coral reefs, especially in the Caribbean area. Harvesting of these has made the production of prostaglandins much less expensive. The intermediates and chemical analogs derived from this natural source of prostaglandins are known as syntons.

prosthetic group. A chemical grouping in which a metal ion is associated with a large molecule or molecular complex, for example, coenzymes and metal-porphyrin complexes such as chlorophyll and hemin. Such groups activate metabolic mechanisms such as phosphorylation, decarboxylation, etc. by coordination reactions with amino acids, proteins, enzymes, and nucleic acids. The behavior of certain vitamins and other metabolites is due in part to prosthetic groups; catalysis is also involved.

"Prostigmin."¹⁹⁰ Trademark for neostigmine U.S.P.

protactinium Pa A radioactive element of atomic number 91, a member of the actinide series. Atomic weight 231.0359; valences 4,5; 13 unstable isotopes, two of which occur naturally. Protactinium is a constituent of all uranium ores, about 340 mg being extracted from one ton. Protactinium may also be produced by irradiation of thorium-230. Purification is carried out by ion exchange and solvent extraction techniques. The longest lived isotope, Pa-231, decays by alpha emission and has a half-life of about 33,000 years. Protactinium may be precipitated as the double potassium fluoride K_2PaF_7 or the oxide Pa_2O_5 . The metal may be prepared by reducing PaF_4 with barium or by heating PaI_4 in a vacuum. It is hard and white, melting near 1600°C. It is too rare for commercial use. Forms several compounds with halogens.

Hazard: Highly toxic radioactive material.

"Protan."¹ Trademark for sodium formate.

Uses: Masking agent in chrome tanning; neutralizer in wool dyeing; preparation of washable wallpapers; acidizing of oil wells; solubilizer and buffering agent for manufacture of chemicals.

"Protargol."¹⁶² Trademark for strong silver protein for use as antibacterial. A different grade also available for use in staining nerve tissue.

protease. A proteolytic enzyme which weakens or breaks the peptide linkages in proteins. They include some of the more widely known enzymes such as pepsin, trypsin, ficin, bromelin, papain and rennin. Being water-soluble they solubilize proteins and are commercially used for meat tenderizers, bread baking and digestive aids.

protective coating. A film or thin layer of metal, glass or paint applied to a substrate primarily to inhibit corrosion and secondarily for decorative purposes. Metals such as nickel, chromium, copper and tin are electrodeposited on the base metal; paints may be sprayed or brushed on. Vitreous enamel coatings are also used, which require baking. Zinc coatings are applied by a continuous bath process, where a strip of ferrous metal is passed through molten zinc. See also galvanizing;terne plate; electroplating; paint; corrosion; cladding.

protective colloid. See colloid, protective.

"Protectol" 3.³⁰⁷ Trademark for a protective colloid, sulfite cellulose liquor; 46% active.

protein. A complex high polymer containing carbon, hydrogen, oxygen, nitrogen, and usually sulfur, and comprised of chains of amino acids (q.v.) connected by peptide linkages ($-CO.NH-$). Proteins occur in the cells of all living organisms and in biological fluids (blood plasma, protoplasm). They are synthesized by plants largely because of the nitrogen-fixing ability of certain soil bacteria. Their molecular weight may be as high as 40 million (tobacco mosaic virus). They have many important functional forms: enzymes, hemoglobin, hormones, viruses, genes, antibodies, and nucleic acids. They also comprise the basic component of connective tissue (collagen), hair (keratin), nails, feathers, skin, etc. Some have been synthesized in the laboratory.

The sequence of amino acids in the polypeptide chain is of critical importance in genetics (see deoxyribonucleic acid). Proteins can be hydrolyzed to

their constituent amino acids and can be broken down into simpler forms by proteolytic enzymes. They form colloidal solutions, and behave chemically as both acids and bases simultaneously (see amphoterics). They are denatured by changes in pH, by heat, ultraviolet radiation, and many organic solvents.

Simple proteins contain only amino acids; conjugated proteins contain amino acids plus nucleic acids, carbohydrates, lipids, etc. On the basis of solubility they can be classified as albumins (water-soluble), globulins (insoluble in water but soluble in aqueous salt solutions), and prolamines (soluble in alcohol-water mixtures but not in alcohol or water alone). A number of proteins have been synthesized, notably the hormone insulin. Proteins are an essential component of the diet, occurring chiefly in meat, eggs, milk and fish. Edible proteins suitable for human food as well as cattle feed can be produced from microorganisms grown in carbonaceous or nitrogenous media to form yeast-like materials. Paraffinic hydrocarbons (methane) and petroleum-derived ethyl alcohol can be used as growth media for protein biosynthesis.

Industrial applications of proteins include plastics, adhesives and fibers derived from casein and soybean protein, but these have been declining in recent years. Special forms in which proteins are commercially available include textured proteins for food products, protein hydrolyzate and liquid predigested protein, both for medical use. See also nutrition; RDA; amino acid; protein, textured; protein hydrolyzate; polypeptide; keratin.

protein hydrolyzate. Solution of protein hydrolyzed into its constituent amino acids. Used extensively in medicine and surgery. Usually administered by a stomach tube or intravenous injection. Grades: U.S.P.

protein, single-cell. A coined name for any protein derived directly from microorganisms.

protein, spun. See protein, textured.

protein, textured. A meat extender or substitute made from defatted soybean flour or similar protein, usually by an extrusion process. Some types are used to fortify cereals and other food products. The filaments produced by extrusion are designed to simulate the fibrous structure (texture) of meats. The term "spinning" is also used, and the products are often called spun proteins.

"Protek-Sorb."²⁴¹ Trademark for a group of silica gels.

"Protobore."³⁴² Trademark for protoveratrin for medicine.

proteolysis. The structural breakdown of proteins, usually by hydrolysis, as a result of the action of an enzyme, e.g., trypsin, pepsin, papain, etc.

prothrombin. The precursor of the enzyme thrombin (q.v.); a proteinaceous component of blood plasma which is converted into thrombin by the blood-clotting mechanism when activated at the site of an open wound. See also coagulation.

protocatechuic aldehyde, methyl ether. See vanillin.

"Protolin."²³ Trademark for reducing agents based on zinc sulfoxylate and zinc formaldehyde sulfoxylate. Supplied as water-soluble white powder. Uses: Stripping colors from fabrics; chemical synthesis.

proton. A fundamental unit of matter having a positive charge and a mass number of 1, equivalent to 1.67 ×

10⁻²⁴ gram. Its mass is 1837 times that of the negatively charged electron, but is almost identical with that of the uncharged neutron. Protons are constituents of all atomic nuclei, their number in each nucleus being the atomic number of the element. An atom of normal hydrogen contains one proton and one electron. In hydrogen compounds which readily ionize, such as HCl, the proton is represented as H⁺ (hydrogen ion).

"Protopet."⁴⁵ Trademark for petrolatum of medium consistency and ranging in color from pure white to amber, but meeting U.S.P. or N.F. purity requirements for petrolatum.

protoplasm. The total contents of the living cell, including both nucleus and cytoplasm. Predominantly a mixture of proteins, protoplasm is the physical basis of life. Most of its components are in the colloidal size range. This term is falling into disuse among modern biochemists. See also cell (1).

protoveratrine. A substance isolated from the *Veratrum album* plant. It is a mixture of two alkaloids, designated protoveratrine A and protoveratrine B. Used in medicine to lower blood pressure.

"Protox."²⁶⁸ Trademark for a series of lead-free zinc oxides manufactured by the American process; produced from zinc ore. Available in pellets and free flowing, nondusting, low bulk for easy handling. Nontoxic.

Uses: Reinforcing agent and accelerator activator for rubber.

"Protozyme."³⁰⁹ Trademark for a series of diastatic, proteolytic, and pectolytic enzymes of fungal origin on a cereal base carrier for application where subsequent filtration permits the removal of the inactive portion.

"Provinite."³⁰⁴ Trademark for a two part barium-cadmium organic vinyl stabilizer.

Properties: (A) soft white powder; sp. gr. 1.4; refractive index 1.56; (B) clear straw-colored liquid; sp. gr. 0.91; refractive index 1.45.

Containers: Up to 375-lb metal drums.

Hazard: Probably toxic.

Uses: Heat and light stabilizer for vinyl film, sheeting and dispersion resin systems.

provitamin. The precursor (q.v.) of a vitamin. Examples are carotene and ergosterol, which upon activation become Vitamin A and Vitamin D, respectively. See also specific compounds.

"Proxocream."⁴⁸⁷ Trademark for a self-emulsifiable, fatty ester-based nonionic softener and lubricant.

"Proxoft-N."⁴⁸⁷ Trademark for a modified, self-emulsifiable, fatty ester-based, nonionic softener and lubricant.

"Proxol."⁴⁸⁷ Trademark for a self-emulsifiable, mineral oil-based lubricant for wool fibers.

"Prunolide."²²⁷ Trademark for gamma-nonyl lactone.

Prussian blue. The most common and best known name for blue iron ferrocyanide (iron blue) pigments made by a variety of procedures. See iron blue.

prussic acid. See hydrocyanic acid.

"Prym."⁴² Trademark for a group of colorless syrups of thermosetting carbamide fiber reactants. Dissolve readily in water at 25°C. Use: Textile finishes.

pseudobutylene glycol. See 2,3-butylene glycol.

pseudocumene (1,2,4-trimethylbenzene; uns-trimethylbenzene) $C_6H_3(CH_3)_3$.

Properties: Liquid; f.p. $-43.91^\circ C$; b.p. $168.89^\circ C$; sp. gr. (20/ $4^\circ C$) 0.8758; refractive index (20/D) 1.5045; flash point $130^\circ F$. Insoluble in water; soluble in alcohol, benzene, and ether.

Derivation: From C_9 fraction of refinery reformat streams by fractional distillation.

Grades: 95%, 99%, and research.

Containers: Bottles; drums.

Hazard: Moderate fire risk. Moderately toxic.

Uses: Manufacture of trimellitic anhydride, dyes, pharmaceuticals and pseudocumidine.

pseudocumidine (2,4,5-trimethylaniline; 1,2,4-trimethyl-5-aminobenzene) $C_6H_2(CH_3)_3NH_2$.

Properties: White crystals; sp. gr. 0.957; m.p. $62^\circ C$; b.p. $236^\circ C$. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: From pseudocumene.

Hazard: Moderately toxic.

Uses: Manufacture of dyes; organic synthesis.

d-pseudoephedrine hydrochloride (USAN)

$C_6H_5CHOHCH(NHCH_3)CH_3 \cdot HCl$.

Properties: Needles; m.p. $181-182^\circ C$. Soluble in water, alcohol, chloroform.

Use: Medicine.

pseudoheptyl alcohol. See 2-ethylbutyl alcohol.

pseudoionone (6,10-dimethyl-3,5,9-undecatriene-2-one) $(CH_3)_2C:CH(CH_2)_2C(CH_3):CHCH:CHCOCH_3$.

Properties: Pale yellow liquid; sp. gr. 0.8984 ($20^\circ C$); b.p. $143-145^\circ C$ (12 mm). Soluble in alcohol and ether. Combustible.

Uses: Perfumery; cosmetics.

psi. Abbreviation for pounds per square inch.

psia. Abbreviation for pounds per square inch absolute.

psig. Abbreviation for pounds per square inch gauge.

psilocin $C_8H_5N(OH)C_2H_4N(CH_3)_2$. An indole derivative. An alkaloid from certain mushrooms; a hallucinogenic drug.

Hazard: Highly toxic.

psilocybin $C_8H_5N(OPO_3H_2)C_2H_4N(CH_3)_2$. An indole derivative. An alkaloid from certain mushrooms; hallucinogenic drug.

Hazard: Highly toxic.

psilomelane $BaMn_2O_6(OH)_4$. A natural oxide of variable composition. Calcium, nickel, cobalt and copper frequently are present. The name sometimes refers to mixtures of manganese minerals.

Properties: Color black; streak brownish black; luster submetallic; hardness 5-6; sp. gr. 3.7-4.7.

Occurrence: U.S.S.R.; India; South Africa; Cuba; Arkansas, Virginia, Georgia.

Use: Important ore of manganese.

psychotropic drug. Any of a number of therapeutic agents which affect the behavior, emotional state, or mental functioning of psychologically disturbed persons. They are widely known as "tranquilizers," but this term is no longer accepted as clinically accurate, as the minor tranquilizers (benzodiazepine and glycerol derivatives) act quite differently from the major tranquilizers. For this reason the latter are now classified as antipsychotics and antidepressants, and the term "anxiety agent" is applied to

the minor tranquilizers. Antipsychotic agents include phenothiazines (chlorpromazine), thioxanthenes, and butyrophenones; antidepressant agents have two major types, i.e., monoamine oxidase (MAO) inhibitors and several tricyclic compounds; antianxiety agents are glycerol derivatives (meprobamate) and benzodiazepine derivatives, e.g., oxazepam.

Pt Symbol for platinum.

PTA. Abbreviation for phosphotungstic acid.

pteroylglutamic acid. See folic acid.

PTFE. Abbreviation for polytetrafluoroethylene (q.v.).

PTMA. Abbreviation for a mixture of phosphotungstic and phosphomolybdic acids, used in making pigments. See phosphotungstic pigment.

PTMS. See para-toluidine-meta-sulfonic acid ($CH_3 = 1$).

ptomaine. A group of highly toxic substances (derivatives of ethers of polyhydric alcohols) resulting from the putrefaction or metabolic decomposition of animal proteins. Examples which have been isolated and prepared synthetically are cadaverine (1,5-diaminopentane) (q.v.), muscarine (hydroxyethyltrimethylammonium hydroxide), putrescine (tetraethylenediamine), and neurine (trimethylvinylammonium hydroxide) (q.v.).

Note: The term "ptomaine poisoning" is usually a misnomer for other types of food poisoning.

PTSA. Abbreviation for para-toluenesulfonamide (q.v.).

ptyalin. A salivary amylase which acts upon alpha-1,4-glycosidic linkages converting starch to various dextrans and maltose. It can act over a pH range of 4.0-9.0; optimum pH 5.6-6.5. It requires the presence of certain negative ions for activation; chlorides and bromides are the most effective.

Use: Biochemical research.

Pu Symbol for plutonium.

pulegium oil. See hedeoma oil.

pulegone (1-isopropylidene-4-methyl-2-cyclohexanone) $C_{10}H_{16}O$. A ketone found in pennyroyal and hedeoma oil. Combustible; low toxicity.

Properties: Oily liquid with pleasant odor; sp. gr. 0.9323 ($20^\circ C$); b.p. $221^\circ C$; dextrorotatory; refractive index (n 20/D) 1.4894.

Uses: Chemical intermediate; flavoring.

pullulan. See starch polymer.

pulp, paper. Processed cellulosic fibers derived from hardwoods, softwoods, and other plants. There are two major types of pulp: (1) ground wood or mechanical pulp, which is merely finely divided wood without purification, and is made into newsprint, cheap manila papers, and nonpermanent tissues; (2) chemical pulp, of which there are three kinds: (a) soda process pulp, obtained from the digestion of wood chips (mostly poplar) by caustic soda; (b) sulfite process pulp (mostly spruce and other coniferous woods) obtained by digestion with a solution of magnesium, ammonium or calcium disulfite containing free sulfur dioxide; and (c) sulfate process (kraft) pulp, in which sodium sulfate is added to the caustic liquors but is reduced by the carbon present to the sulfide, which becomes a digesting agent. Sulfite and sulfate pulps (chiefly from softwoods, q.v.) comprise the bulk of paper pulps. Sulfate pulps are known as kraft pulps because of their strength, and are

used for wrapping, packaging, container board, etc. A relatively new process called holopulping replaces sodium sulfate with oxidants. A synthetic pulp based on polyolefins (styrene copolymer fibers) has been developed to the production stage in Japan. See also holopulping; paper; digestion.

pumice. A highly porous igneous rock, usually containing 67–75% SiO_2 and 10–20% Al_2O_3 ; glassy texture. Potassium, sodium, and calcium are generally present. Insoluble in water; not attacked by acids.

Occurrence: Arizona, Oregon, California, Hawaii, New Mexico; Italy; New Zealand, Greece.

Grades: Lump; powdered coarse, medium, fine; N.F.; technical.

Containers: Bags; ton lots.

Uses: Concrete aggregate; heat and sound insulation; filtration; finishing glass and plastics; road construction; scouring preparations; paint fillers; absorbents; support for catalysts; dental abrasive; adherent for uncured rubber products.

"Purafil."⁵²⁵ Trademark for an odoroxidant consisting of activated alumina impregnated with potassium permanganate in pellet form. Destroys odors by oxidation.

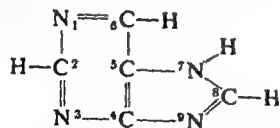

"Purecal."²⁰³ Trademark for a series of calcium carbonates produced by a special precipitation process which results in finer particles of cubical shape.

Uses: Coating fine paper stocks; filler in rubber and plastics; extender for paints, printing inks; filler in dentifrices, cosmetics, pharmaceuticals; neutralizing agent in preparation of antibiotics; insecticide carrier; enamel-color extender in ceramics; calcium enrichment of food products.

purification. Removal of extraneous materials (impurities) from a substance or mixture by one or more separation techniques. A pure substance is one in which no impurity can be detected by any experimental procedure. Though absolute purity is impossible to attain, a number of standard procedures exist for approaching it to the extent of 1 part per million of impurity. The following fractionation techniques are widely used: crystallization, precipitation, distillation, adsorption (various types of chromatography), extraction, electrophoresis, and thermal diffusion. See also purity, chemical.

"Purifloc."²³³ Trademark for a polyelectrolyte (q.v.) used to flocculate solids in water and industrial waste treatment.

purine (1) [imidazo (4,5-d) pyrimidine]

Properties: Colorless crystals; m.p. 217°C; soluble in water, alcohol, toluene; slightly soluble in ether.

Derivation: Prepared from uric acid and regarded as the parent substance for compounds of the uric group, many of which occur naturally in animal waste products.

Uses: Organic synthesis; metabolism and biochemical research.

(2) One of a number of basic compounds found in living matter and having a purine-type molecular structure. See adenine, guanine, hypoxanthine, xanthine, uric acid, caffeine, and theobromine.

"Purinethol."³⁰¹ Trademark for 6-mercaptapurine (q.v.).

"Purite."⁸⁴ Trademark for a specially prepared fused soda ash furnished in the form of two-pound cast pigs and stated to contain over 98% sodium carbonate. Uses: Cupola flux; refining and desulfuring iron, steel and other metals.

purity, chemical. A substance is said to be pure when its physical and chemical properties coincide with those previously established and recorded in the literature, and when no change in these properties occurs after application of the most selective fractionation techniques. In other words, purity exists when no impurity can be detected by any experimental procedure. There are a number of recognized standards of purity. See also grade.

"Purodigin."²⁴ Trademark for digitoxin (q.v.).

puromycin (USAN) $\text{C}_{22}\text{H}_{25}\text{N}_7\text{O}_5$. Crystals; m.p. 176°C. An antibiotic which inhibits protein synthesis, prevents transfer of amino acid from its carrier to the growing protein. Produced by *Streptomyces alboniger*; effective against bacteria, protozoa, parasitic worms, and cancerous tumors. Toxic to living cells of all kinds.

purple of Cassius. See gold-tin purple.

purpurin (1,2,4-trihydroxyanthraquinone)

$\text{C}_{14}\text{H}_5\text{O}_2(\text{OH})_3$.

Properties: Reddish needles; m.p. 256°C; slightly soluble in hot water; soluble in alcohol and ether.

Derivation: Occurs as a glucoside in madder root. Made synthetically by oxidation of alizarin.

Uses: Dye for cotton; stain for microscopy; reagent for calcium.

purpurin red. See anthrapurpurin.

"Purzaust."⁴¹⁶ Trademark for a catalytic converter developed for the removal of air pollutants normally present in exhaust gases from internal combustion engines. A fixed bed of solid catalyst promotes oxidation of combustible pollutants to carbon dioxide and water.

"PuTrol."¹⁸⁸ Trademark for a powerful aromatic compound used for masking the odors of putrefaction associated with the decomposition of proteins, as in fat-rendering operations, sewage disposal, and industrial wastes.

putty. A mixture of whiting (chalk) with from 12 to 18% of linseed oil, with or without white lead or other pigment. Containers must be air-tight. Uses: Sealant; glass setting; caulking agent.

putty powder. A soft abrasive composed of tin oxide.

PVA. Abbreviation for polyvinyl alcohol.

PVAc. Abbreviation for polyvinyl acetate.

PVB. Abbreviation for polyvinyl butyral.

PVC. Abbreviation for (1) polyvinyl chloride, and (2) pigment volume concentration, a term used in paint technology to mean pigment volume divided by the sum of the pigment volume and the vehicle solids volume, multiplied by 100.

PVdC. See polyvinyl dichloride.

PVE. Abbreviation for polyvinyl ethyl ether.

PVI. Abbreviation for polyvinylisobutyl ether.

PVM. Abbreviation for polyvinyl methyl ether.

PVM/MA. See polyvinyl methyl ether/maleic anhydride.

PVOH. Abbreviation for polyvinyl alcohol.

PVP. Abbreviation for polyvinylpyrrolidone.

PVT. Abbreviation for pressure-volume-temperature; used in chemical engineering.

"PX."²⁸ Trademark for special grade of pyroxylin-impregnated, washable book cloth for bookbindings.

py. An abbreviation for pyridine, used as in formulas for coordination compounds. See also dien; en; pn.

"Pycal."⁸⁹ Trademark for a series of plasticizers used for cellulose acetate, cellulose acetate butyrate, nitrocellulose, vinyls, and synthetic rubber.

"Pynol."⁷⁹ Trademark for a stream-distilled pine oil. Uses: Mining-flotation; textile dyeing and cleaning; laundries; disinfectants; insecticides; deodorants; cleaning compounds; coated paper; paint and varnish; pharmaceuticals.

"Py-Ran."⁵⁸ Trademark for food grade of anhydrous monocalcium phosphate $\text{CaH}_4\text{P}_2\text{O}_8$ or $\text{CaH}_4(\text{PO}_4)_2$.

"Pyranol."²⁴⁵ Trademark for a dielectric material, principally of the askarel type (q.v.).

"Pyratex."²⁴⁸ Trademark for a vinylpyridine latex. Properties: Total solids 40–42%, pH 10.4–11.5; sp. gr. 0.96.

Uses: To promote adhesion between rayon or nylon fibers and rubber, as in tire cord, belting, hose, etc.

"Pyrax."⁶⁹ Trademark for a ground pyrophyllite-aluminum silicate used as a filler in paints, plastics, and for dusting unvulcanized rubber.

pyrazine hexahydrate. See piperazine.

pyrazole HNNCHCHCH .

Properties: Off-white crystalline solid with pyridine odor; m.p. 68–70°C; b.p. 186–188°C; soluble in water and alcohol.

Hazard: Toxic by ingestion and inhalation; irritant to skin and eyes.

Uses: Chemical intermediate; stabilizer for halogenated solvents and lubricating oils.

pyrazoline $\text{HNNCHCH}_2\text{CH}_2$. B.p. 144°C.

Use: Organic synthesis.

pyrazolone dye. A dye whose molecules contain both the $-\text{N}=\text{N}-$ and the $=\text{C}=\text{C}=$ chromophore groups in their structure. These are acid dyes most used for silk and wool, and to some extent for lakes. Tartrazine, C.I. 19140, is an important member of this group. See dye.

"Pyrefume."³⁴² Trademark for pyrethrin-extract insecticidal concentrates.

"Pyre-M.L."²⁸ Trademark for polyimide coated fabrics and laminates; used as class H electrical insulating materials.

pyrene $\text{C}_{16}\text{H}_{10}$. A condensed ring hydrocarbon.

Properties: Colorless solid (tetracene impurities give a yellow color); solutions have a slight blue fluorescence. M.p. 156°C; sp. gr. 1.271 (23°C); b.p. 404°C. Insoluble in water; fairly soluble in organic solvents. Derivation: From coal tar.

Hazard: A carcinogenic agent. Tolerance, 0.2 mg per cubic meter in air.

Use: Biochemical research.

pyrethrin I $\text{C}_{21}\text{H}_{28}\text{O}_3$. Pyrethrolone ester of cyrysanthemum monocarboxylic acid. Most potent insecticidal ingredient of pyrethrum flowers. See also cinerin I and II and pyrethrin II.

Properties: Viscous liquid, oxidizes readily in air. Insoluble in water; soluble in other common solvents. Incompatible with alkalis.

Source: Pyrethrum extract (q.v.).

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Household insecticide (flies, mosquitoes, garden insects, etc.).

pyrethrin II $\text{C}_{22}\text{H}_{28}\text{O}_3$. Pyrethrolone ester of chrysanthemum dicarboxylic acid. One of the four primary active insecticidal ingredients of pyrethrum flowers. See also pyrethrin I, cinerin I and II. Properties similar to those of pyrethrin I; less toxic than pyrethrin I.

Source: Pyrethrum extract (q.v.).

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Household insecticide (flies, mosquitoes, garden insects, etc.).

pyrethrum extract. An extract obtained from powdered pyrethrum flowers by using a hydrocarbon of the kerosine type; also made synthetically. Not compatible with alkaline material. The chief constituents are pyrethrins I and II and cinerins I and II (see also allethrin). These compounds are nonvolatile and very slightly soluble in water.

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Household insecticide (flies, mosquitoes, garden insects, etc.).

"Pyretox."⁵⁵ Trademark for an insecticide containing 1.0% by wt. of pyrethrin.

"Pyrexcel."³⁴² Trademark for synergized pyrethrin extracts for insecticides.

"Pyrex Glass Brand No. 7740."²⁰ Trademark for a borosilicate glass.

Properties: Linear coefficient of expansion, $32 \times 10^{-7}/^\circ\text{C}$; elasticity coefficient 6.230 kg/sq mm; hardness (scleroscope) 120; sp. gr. 2.25; specific heat 0.20; refractive index 1.474 dispersion 0.00738; light and heat transmission higher than the best plate glass; dielectric constant 4.5 (25°C); upper working temperature (mechanical considerations only): annealed, extreme limit 490°C, normal service 230°C; thermal stress resistance 53°C; impact abrasion resistance 3.1; softening temp. 820°C.

Uses: Laboratory and pharmaceutical glassware and apparatus; electrochemical equipment; fiber manufacture; domestic ovenware apparatus and equipment for many processes.

"Pyribenzamine" Citrate.³⁰⁵ Trademark for tripelenamine citrate (q.v.).

pyridine $\text{N}(\text{CH}_3)_3$.

Properties: Slightly yellow or colorless liquid; nauseating odor; burning taste; slightly alkaline in reaction. Soluble in water, alcohol, ether, benzene, ligroin and fatty oils. Sp. gr. 0.978; f.p. -42.0°C; b.p. 115.5°C; flash point (closed cup) 68°F. Autoignition temp. 900°F.

Derivation: (a) By coal carbonization, and recovery both from coke-oven gases and the coal tar middle oil. (b) Also synthetically from acetaldehyde and ammonia.

Grades: Technical, as 20°C, 2°C, etc. (meaning distillation range); medicinal; C.P.; spectrophotometric. Containers: Bottles; drums; barrels; tank cars.

Hazard: Toxic by ingestion and inhalation. Tolerance, 5 ppm in air. Flammable, dangerous fire risk. Explosive limits in air 1.8 to 12.4%. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Synthesis of vitamins and drugs; solvent; waterproofing; rubber chemicals; denaturant for alcohol and antifreeze mixtures; dyeing assistant in textiles; fungicides.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

2-pyridine aldoxime methiodide (PAM)

$C_5H_4CHNOH \cdot ICH_3$. Antidote for nerve gas, because of its property of reactivating the enzyme cholinesterase by removal of phosphoryl groups introduced by the nerve gas.

pyridine-3-carboxylic acid. See niacin.

3-pyridine diazonium fluoborate. Intermediate in manufacture of 3-fluoropyridine. Explodes when dry.

2,5-pyridinedicarboxylic acid. See isocinchomeric acid.

3-pyridinemethanol. See nicotiny alcohol.

pyridine-N-oxide C_5H_5NO . F.p. 67.0°C. Soluble in water. Used as an intermediate.

Hazard: Probably toxic and flammable.

pyridine polymer. A polymer or copolymer of methylvinylpyridine and vinylpyridine; used for corrosion inhibitors and as intermediates for coatings and printing inks.

2-pyridinethiol-1-oxide. See 1-hydroxy-2-pyridine thione.

pyridinium bromide perbromide (PBPB) $C_5H_5NBr \cdot Br_2$.

Properties: Red prismatic crystals; m.p. 135–137°C (dec) with preliminary softening. The salt is stable in the dry state and can be used in glacial acetic acid, ethanol and related solvents. This compound has 45% to 50% available bromine.

Use: Brominating phenols, and addition to double bonds; mono- and polybromination of ketones, including aliphatic, alicyclic, steroid and amino carbonyls. Micro or semimicro quantitative analysis.

"Pyridium."⁵⁴⁶ Trademark for phenazopyridine hydrochloride. Used in medicine.

pyridostigmine bromide $C_5H_4N(CH_3)OOCN(CH_3)_2Br$. 3-Hydroxy-1-methylpyridinium bromide dimethylcarbamate.

Properties: White or practically white, crystalline powder. Agreeable odor; hygroscopic. Freely soluble in water, alcohol, and chloroform. M.p. 154–157°C. Grade: U.S.P.

Use: Medicine.

pyridoxal hydrochloride $C_8H_9NO_3 \cdot HCl$. An aldehyde derivative of pyridoxine, with vitamin B₆ activity.

Properties: Rhombic crystals; m.p. 165°C (dec); soluble in water and 95% ethyl alcohol. Low toxicity. Use: Nutrition.

pyridoxal phosphate (2-methyl-3-hydroxy-4-formyl-5-pyridylmethylphosphoric acid)

$CH_3C_5H_4HN(OH)(CHO)(CH_2PO_3H_2)$. The coenzyme of amino acid metabolism, which also is the active group of various decarboxylases and other types of enzymes. It is closely related to pyridoxine (q.v.). Low toxicity.

Derivation: Synthesized (a) through the action of adenosine triphosphate, or phosphorus oxychloride, on pyridoxal, and (b) by phosphorylation of pyridoxamine followed by oxidation with 100% H_3PO_4 . Uses: Medicine; nutrition.

pyridoxine (vitamin B₆) $CH_3C_5H_4N(OH)(CH_2OH)$.

3-Hydroxy-4,5-dimethylol-2-methylpyridine. A group name designating the naturally occurring pyridine derivatives having vitamin B₆ activity. Essential for the dehydration and desulfhydration of amino acids and for the normal metabolism of tryptophan; appears to be related to fat metabolism. Pyridoxine is required in the nutrition of all species of animals. Nontoxic.

Sources: (Food): vegetable fats, whole grain cereals, legumes, yeast, muscle meats, liver, and fish. (Commercial): synthetic pyridoxine, pyridoxal, and pyridoxamine are produced by a complex series of reactions from isoquinoline.

Units: Amounts are expressed in micrograms.

Uses: Medicine; nutrition. (Available as pyridoxine hydrochloride).

alpha-pyridylamine. See 2-aminopyridine.

beta-pyridylamine. See 3-aminopyridine.

3-pyridylcarbinol (3-pyridine methanol)

$C_5H_4NCH_2OH$.

Properties: Colorless liquid. B.p. 266°C; f.p. -6.5°C; density (20°C) 1.131 g/ml; refractive index (n_D 20°C) 1.5455. Soluble in water at 20°C in all proportions. Hygroscopic. Low toxicity. Combustible.

Use: Intermediate.

pyrimidine. One of a group of basic compounds found in living matter. They may be isolated following complete hydrolysis of nucleic acids. They include uracil, thymine, cytosine, and methylcytosine. Thiamine is also a pyrimidine derivative. Other pyrimidines such as alloxan and thiouracil are important in medicine and biochemical research. See also purine.

pyrite (iron pyrite; fool's gold). FeS_2 , often with small amounts of copper, arsenic, nickel, cobalt, gold, selenium.

Properties: Brass-yellow or brown tarnished mineral, greenish or brownish-black streak, metallic luster. Sp. gr. 4.9–5.2; hardness 6–6.5.

Uses: Manufacture of sulfur, sulfuric acid and sulfur dioxide; ferrous sulfate; cheap jewelry; recovery of metals.

See also ferrous sulfide.

pyrite, magnetic. See pyrrhotite.

pyrithiamine (neopyrithiamine) $C_{14}H_{20}Br_2N_4O$. A thiamine antagonist.

Properties: Crystallizes from acetone; m.p. 219°C (dec); soluble in water.

Derivation: Synthetically from the condensation of 2-methyl-3-(beta-hydroxyethyl)pyridine with the pyrimidine moiety of thiamine.

Use: Biochemical research.

pyro-. A prefix indicating formation by heat; specifically, an inorganic acid derived by loss of one molecule of water from two molecules of an ortho acid, as pyrophosphoric acid.

"Pyrobor."⁸⁸ Trademark for dehydrated borax, $Na_2B_4O_7$.

pyroboric acid (tetraboric acid) $H_2B_4O_7$. Vitreous or white powder; soluble in water and in alcohol.

"Pyrobrite."²⁸⁸ Trademark for a bright leveling, pyrophosphate copper electroplating process. The mate-

rials used are copper pyrophosphate trihydrate, potassium pyrophosphate, ammonium hydroxide, and addition agents.

pyrocatechol (ortho-dihydroxybenzene; catechol)

$C_6H_4(OH)_2$.

Properties: Colorless crystals; discolors to brown on exposure to air and light, especially when moist; sp. gr. 1.371; m.p. 104°C; b.p. 245°C, sublimes; soluble in water, alcohol, ether, benzene and chloroform, also in pyridine and aqueous alkaline solutions. combustible. Flash point 261°F (C.C.).

Derivation: (a) By fusion of ortho-phenolsulfonic acid with caustic potash at 350°C. (b) By heating guaiacol with hydriodic acid.

Grades: Technical; C.P.; resublimed.

Containers: 25- to 200-lb drums.

Hazard: Strong irritant.

Uses: Antiseptic; photography; dyestuffs; electroplating; specialty inks; antioxidants and light stabilizers; organic synthesis.

pyrocatechol dimethyl ether. See veratrole.

pyrocatechol methyl ester. See guaiacol.

"Pyroceram" Brand Cement.²⁰ Trademark for powdered glasses which are thermosetting and utilized for sealing inorganic materials as in vacuum tubes. The resultant seals are crystalline and have service temperatures in excess of the sealing temperatures.

"Pyroceram" Brand 9606.²⁰ Trademark for a crystalline ceramic material made from glass by controlled nucleation (q.v.).

Properties: Hard, brittle solid. Sp. gr. 2.61; specific heat 0.185 (25°C); softening temp. 1260°C; thermal conductivity 0.0087 cgs; dielectric constant 5.5 (25°C); expansion coefficient 57×10^{-7} per °C; flexural strength 20,000 psi; Knoop hardness (100 g) 698.

Uses: Envelope material for vacuum tubes and other electronic devices.

"Pyroceram" Brand 9608.²⁰ Trademark for a crystalline ceramic material made from glass by controlled nucleation (q.v.).

Properties: Hard, brittle solid; specific gravity 2.5; softening temp. 1250°C; specific heat 0.19 (25°C); thermal conductivity 0.0047 cgs; dielectric constant (25°C) 6.54; flexural strength 14,000–23,000 psi; Knoop hardness (100 g) 703.

Uses: Telescope mirrors; special-purpose ceramic products.

pyrochlore ($NaCaNb_2O_6F$. A complex oxide of sodium, calcium and niobium. Tantalum, rare earth metals, and other elements may be present. Color brown to black, streak light brown; hardness 5–5.5; sp. gr. 4.2–6.4.

Occurrence: Canada (Quebec); Brazil; Africa.

Use: Ore of niobium.

pyrochroite. See manganous hydroxide.

pyrogallol (pyrogalllic acid; 1,2,3-trihydroxybenzene) $C_6H_3(OH)_3$.

Properties: White, lustrous crystals; turn gray on exposure to light; sp. gr. 1.463; m.p. 132.5°C; b.p. 309°C; soluble in water, alcohol, and ether. A solution of pyrogallol acquires a brown color on exposure to air. This absorption of oxygen and change of color take place rapidly when the solution is made alkaline.

Derivation: By heating gallic acid with three times its weight of water in an autoclave.

Hazard: Toxic by ingestion and skin absorption.

Uses: Protective colloid in preparation of metallic colloidal solutions; photography; dyes; intermediates; synthetic drugs; medicine; process engraving; laboratory reagent; gas analysis; reducing agent. Antioxidant in lubricating oils.

"2-Pyrol"³⁰⁷ Trademark for 2-pyrrolidone (q.v.).

pyroligneous acid (wood vinegar; pyroligneous liquor).

Crude yellow to red liquid, a mixture of materials from wood distillation. Crude product contains methanol, acetic acid, acetone, furfural and various tars and related products; sp. gr. 1.018–1.030; miscible with water and alcohol.

pyrolusite (manganese dioxide, black) MnO_2 .

Properties: Iron-black to dark steel-gray or bluish mineral; streak, black or bluish-black; luster, metallic or dull. Soluble in hydrochloric acid. Sp. gr. 4.73–4.86; Mohs hardness 2–2.5.

Occurrence: United States (Virginia, Georgia, Arkansas, Lake Superior region, Massachusetts, Vermont, New Mexico); Germany; Australia; India; Canada.

Uses: Manganese ore. See also manganese dioxide. For many uses the ore and synthetic material are interchangeable, but pyrolusite is not usable for batteries.

"Pyrolux Maroon."¹⁴¹ Trademark for organic maroon pigments used in plastics.

pyrolysis. Transformation of a compound into one or more other substances by heat alone, i.e., without oxidation. It is thus similar to destructive distillation. Though the term implies decomposition into smaller fragments, pyrolytic change may also involve isomerization and formation of higher molecular weight compounds. Hydrocarbons are subject to pyrolysis, e.g., formation of carbon black and hydrogen from methane at 1300°C and decomposition of gaseous alkanes at 500 to 600°C. The latter is the basis of thermal cracking (pyrolysis gasoline).

One application of pyrolysis is conversion of acetone into ketenes by decomposition at about 700°C; the reaction is $CH_3COCH_3 \rightarrow H_2C=C=O + CH_4$. Pyrolysis of natural gas or methane at about 2000°C and 100 mm Hg pressure produces a unique form of graphite. Synthetic crude oil can be made by pyrolysis of coal, followed by hydrogenation of the resulting tar. Large-scale pyrolysis of solid wastes is being conducted for production of synthetic fuel oils and other products; the method is said to require only 30 minutes at about 1000°F (flash pyrolysis). A pyrolysis method for recovery of usable materials from scrap tires is under development.

See also destructive distillation.

pyrolysis gasoline. See under gasoline.

pyromellitic acid (PMA; 1,2,4,5-benzenetetracarboxylic acid) $C_6H_2(COOH)_4$.

Properties: White powder; sp. gr. 1.79; m.p. 257–265°C; b.p., converts to dianhydride; bulk density 32 lb/cu ft. Absorbs moisture slowly if exposed to atmosphere.

Grade: 99% purity.

Hazard: Skin irritant.

Uses: Intermediate for polyesters and polyamides used in electrical and nonfogging plasticizers, lubricants and waxes.

pyromellitic dianhydride (PMDA) $C_6H_2(C_2O_3)_2$.

Properties: White powder; sp. gr. 1.68; m.p. $286^\circ C$; b.p. $397\text{--}400^\circ C$, $305\text{--}310^\circ C$ (30 mm); bulk density 21 lb/cu ft. Soluble in some organic solvents. Hydrolyzes to the acid when exposed to moisture.

Derivation: Oxidation of durene, either in wet process by nitric acid or a dichromate, or as direct air oxidation with catalyst.

Grade: 98+% purity.

Hazard: Skin irritant.

Uses: Curing agent for epoxy resins used in high temperature laminates, molds, and coatings; cross-linking agent for epoxy plasticizers in vinyls; alkyd resins; intermediate for pyromellitic acid.

pyrometric cone (Seeger cone). A small pyramid composed of mixtures of oxides which melt at known temperatures; used to measure temperatures in autoclaves, curing ovens, etc. in the $1100\text{--}3700^\circ F$ range.

pyromucamide. See furoamide.

pyromucic acid. See furoic acid.

pyromucic aldehyde. See furfural.

"Pyron."⁴³³ Trademark for iron and steel powders.

"Pyronate."⁴⁴⁵ Trademark for water-soluble petroleum sulfonates.

"Pyronil."¹⁰⁰ Trademark for pyrrobutamine phosphate (q.v.).

pyrophoric. Descriptive of a substance that will ignite in air at or below room temperature in the absence of added heat, shock or friction. Titanium dichloride and phosphorus are examples of pyrophoric solids; tributylaluminum and related compounds are pyrophoric liquids. Sodium, butyllithium and lithium hydride are spontaneously flammable in moist air, as they react exothermically with water. Such materials must be stored in an atmosphere of inert gas or under kerosene. Some alloys (barium, misch metal) are called pyrophoric because they spark when slight friction is applied; they are used as tips in pocket lighters and similar devices.

Hazard: Dangerous fire risk near combustible materials.

Shipping regulations: Pyrophoric liquids: (Rail) Red label. (Air) Not acceptable.

pyrophosphoric acid (also called diphosphoric acid) $H_4P_2O_7$. See also polyphosphoric acid.

Properties: A viscous, syrupy liquid which tends to solidify on long standing at room temperature. When diluted with water it is rapidly converted into orthophosphoric acid. Soluble in water. M.p. $54^\circ C$.

Derivation: By heating phosphoric acid at $250\text{--}260^\circ C$. Further heating produces metaphosphoric acid.

Grade: Technical.

Containers: Carboys; casks.

Hazard: Moderately toxic.

Uses: Catalyst; manufacture of organic phosphate esters; metal treatment; stabilizer for organic peroxides.

pyrophyllite (agalmatolite) $Al_2Si_4O_{10}(OH)$. A natural hydrous aluminum silicate, found in metamorphic rocks.

Properties: Color white, green, gray, brown; luster pearly to greasy; good micaceous cleavage; sp. gr. 2.8–2.9. Mohs hardness 1–2. Similar to talc. Low toxicity.

Occurrence: North Carolina, California; Newfoundland; Japan.

Uses: Ceramics; insecticides; slate pencils; substitute

for talc; extender in paints; wallboard; buffer in high-pressure equipment; permissible animal feed additive.

pyroracemic acid. See pyruvic acid.

pyrosulfuric acid. See sulfuric acid, fuming.

pyrosulfuryl chloride (disulfuryl chloride) $S_2O_5Cl_2$.

Properties: Colorless, mobile; very refractive, fuming liquid; sp. gr. 1.819; b.p. $146^\circ C$; f.p. $-38^\circ C$; refractive index (n 19/D) 1.449.

Containers: Carboys.

Hazard: Decomposes violently with water to sulfuric and hydrochloric acids. Toxic and irritant.

Use: Organic synthesis.

Shipping regulations: (Rail) White label, (Air) Corrosive label.

pyrotartaric acid (methylsuccinic acid)

$HOOCCH(CH_3)CH_2COOH$.

Properties: White or yellowish crystals. Soluble in water, alcohol, and ether. Sp. gr. 1.4105; m.p. $111\text{--}112^\circ C$.

Derivation: By distilling tartaric acid.

Uses: Organic synthesis.

pyrotartaric acid, normal. See glutaric acid.

pyrotechnics. The formulation and manufacture of fireworks, signal flares and military warning devices; it involves the use of phosphorus; magnesium; potassium nitrate, chlorate, and dichromate; strontium compounds; and numerous other substances that emit a bright, colored light when deflagrated.

pyrovanadic acid. See vanadic acid.

"Pyrovatex" CP.⁴⁴³ Trademark for a fiber-reactive phosphone alkyl amide.

Properties: Odorless, nontoxic, nonirritating; stable to laundering and dry-cleaning. Reduces tear and tensile strengths; no effect on "hand." Compatible with other finishing and proofing agents and precured durable press processes. From 25 to 35% by weight is required. Imparts self-extinguishing properties to cotton.

Uses: Flame retardance of 100% cotton fabrics, such as tenting, military uniforms, draperies, etc.

pyroxylin. See nitrocellulose.

pyrrhotite (magnetic pyrites, pyrrhotine) FeS . A natural iron sulfide. Frequently has a deficiency in iron. May contain small amounts of nickel, cobalt, manganese and copper.

Properties: Color brownish bronze; streak black; luster metallic; slightly magnetic; hardness 4; sp. gr. 4.6.

Occurrence: Tennessee, Pennsylvania; Europe; Canada.

Uses: Ore of iron; manufacture of sulfuric acid.

pyrrobutamine phosphate

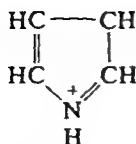

$ClC_6H_4CH_2C(C_6H_5):CHCH_2NC_4H_8 \cdot 2H_3PO_4$. (1-[4-(para-Chlorophenyl)-3-phenyl-2-butenyl]pyrrolidine diphosphate).

Properties: Cream to off-white powder with a slight odor and a bitter taste. Soluble in water, slightly soluble in alcohol, almost insoluble in chloroform and ether. Melting range 127° to $131^\circ C$.

Grade: N.F.

Use: Medicine.

pyrrole. Pyrrole is regarded as a resonance hybrid, and no one structure adequately represents it. An approximation is:

Properties: Yellowish or brown oil; burning, pungent taste; odor similar to chloroform; readily polymerizes by the action of light and turns brown. Soluble in alcohol, ether, and dilute acids; insoluble in water and dilute alkalis. B.p. 130–131°C; f.p. –24°C; sp. gr. 0.968 (20/4°C); refractive index (n_D 20) 1.5091; flash point (TCC) 102°F; soluble in most organic chemicals. Combustible.

Derivation: Fractional distillation of bone-oil with sulfuric acid.

Method of purification: Conversion into the potassium compound (C₄H₄NK), washing with ether and treatment with water, followed by drying and distillation.

Grade: Technical.

Hazard: Moderate fire risk. Moderately toxic by ingestion and inhalation.

Use: Manufacture of pharmaceuticals.

pyrrolidine C₄H₉N.

Properties: Colorless to pale yellow liquid; penetrating amine-like odor. Sp. gr. 0.8660 (20/20°C); f.p. –60°C; b.p. 87°C; refractive index 1.4425 (n_D 20). Flash point 37°F (TCC). Soluble in water and alcohol.

Grades: 95% min purity.

Uses: Intermediate for pharmaceuticals, fungicides, insecticides, rubber accelerators; citrus decay control; curing agent for epoxy resins; inhibitor.

Containers: 1-, 5-gal cans; 55-gal drums.

Hazard: Flammable, dangerous fire risk. Moderately toxic by ingestion and inhalation.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

2-pyrrolidinecarboxylic acid. See proline.

2-pyrrolidone (2-pyrrolidinone, butyrolactam).

Properties: Light yellow liquid; specific gravity 1.1; b.p. 245°C; soluble in water, ethanol, ethyl ether, chloroform, benzene, ethyl acetate, carbon disulfide. High-boiling, noncorrosive; flash point 265°F. Combustible. See polyvinylpyrrolidone.

Derivation: From acetylene and formaldehyde by high-pressure synthesis.

Uses: Plasticizer and coalescing agent for acrylic latexes in floor polishes; solvent for polymers, insecticides, polyhydroxylic alcohols, sugar, iodine, speciality inks, monomer for nylon-4.

Pyrrone An aromatic heterocyclic polymer derived from a cyclic dianhydride and an aromatic orthotetramine or a derivative. Stable to about 900°F.

Uses: Films, coatings, adhesives, laminates and moldings.

Pyruvaldehyde. See pyruvic aldehyde.

Pyruvic acid (alpha-ketopropionic acid; acetylformic acid; pyroracemic acid) CH₃COCOOH. A fundamental intermediate in protein and carbohydrate metabolism in the cell.

Properties: Liquid with odor resembling acetic acid; sp. gr. 1.2272 (20/4°C); m.p. 13.6°C; b.p. 165°C; miscible with water, ether, and alcohol.

Derivation: Dehydration of tartaric acid by distilling with potassium acid sulfate.

Use: Biochemical research.

Pyruvic alcohol. See hydroxy-2-propanone.

Pyruvic aldehyde (pyruvaldehyde; methyl glyoxal) CH₃COHCO.

Properties: Supplied commercially as approximately 30% aqueous solution; sp. gr. 1.20 (20/20°C); 10 lb/gal (20°C). Low toxicity.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Organic synthesis, as of complex chemical compounds such as pyrethrins; tanning leather; flavoring.

acids (with formation of salts); very slightly soluble in water.

Derivation: Finely ground cinchona bark mixed with lime is extracted with hot high-boiling paraffin oil. The solution is filtered, shaken with dilute sulfuric acid, the latter neutralized hot with sodium carbonate and on cooling quinine sulfate crystallizes out. The sulfate is treated with ammonia, the alkaloid being obtained.

Source: Indonesia; Bolivia.

Containers: Vials; up to 1000-oz drums.

Uses: Medicine (antimalarial), as the alkaloid or as numerous salts and derivatives; beverages.

beta-quinine. See quinidine.

quinine acid sulfate. See quinine.

quinine bisulfate. See quinine.

quinine carbacrylic resin. The quinine salt of a polyacrylic carboxylic acid resin. Contains 1.85% of quininium ion.

Properties: Buff, odorless, tasteless, free-flowing, amorphous, granular solid. Practically insoluble in dilute acids and alkalis, alcohol, ether and water.

Use: Medicine.

quinine sulfate ($C_{20}H_{24}N_2O_2$) $_2 \cdot H_2SO_4 \cdot 2H_2O$.

Properties: White needle-like crystals; odorless; very bitter taste; turns brown in the light; a saturated solution is neutral or slightly alkaline to litmus paper; m.p. 205°C; if exposed to damp air it may take up 5 H₂O. Loses water of crystallization at about 100°C. Soluble in hot water and in alcohol. Slightly soluble in chloroform and ether.

Grades: N.F.; F.C.C.

Containers: See quinine.

Uses: Medicine (antimalarial); flavoring agent.

quinine-urea hydrochloride (urea-quinine)

$C_{20}H_{24}N_2O_2 \cdot HCl \cdot CO(NH_2)_2 \cdot HCl \cdot 5H_2O$.

Properties: White, granular powder, or colorless translucent prisms. Bitter taste, odorless. Contains not less than 58% anhydrous quinine. Soluble in water and strong alcohol.

Derivation: By dissolving quinine hydrochloride in hydrochloric acid, filtering, adding urea, heating and crystallizing.

Grade: U.S.P.

Use: Medicine.

quinizarin (1,4-dihydroxyanthraquinone)

$C_{14}H_8O_2(OH)_2$.

Properties: Red or yellow-red crystals; m.p. 194–195°C. Soluble in hot water, alcohol, ether and benzene, and in potassium hydroxide and sulfuric acid.

Use: Antioxidant in synthetic lubricants.

quinolidine (chinoidine)

Properties: Brownish black lustrous mass; resinous appearance; conchoidal fracture; very bitter taste. It is a mixture of the amorphous alkaloids remaining in the solution from the extraction of cinchona bark, after the crystallizable alkaloids have been removed. Soluble in dilute acids, alcohol and chloroform. M.p., softens below 100°C.

Containers: 70-, 140-lb drums.

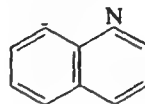

Hazard: Moderately toxic and irritant.

Uses: Medicine, either as such, or as the borate, citrate, hydrochloride, sulfate or tannate.

quinol. See hydroquinone.

quinoline (chinoline)

Properties: A basic heterocyclic nitrogenous compound occurring in coal tar and obtained from it, but more frequently by synthesis; highly refractive, colorless liquid; darkens with age; hygroscopic; peculiar odor. Soluble in water, alcohol, ether and carbon disulfide. Sp. gr. 1.0899; f.p. –15°C; b.p. 238°C. Combustible. Autoignition temp. 896°F.

Derivation: By treatment of aniline and nitrobenzene with glycerol and sulfuric acid and heat.

Containers: Glass bottles; drums; tank cars.

Uses: Medicine; preserving anatomical specimens; manufacture of quinolinol sulfate, niacin, and copper-8-quinolinolate.

quinoline dye. See cyanine dye.

8-quinolinol. See 8-hydroxyquinoline.

8-quinolinol-7-iodo-5-sulfonic acid. See 7-iodo-8-hydroxyquinoline-5-sulfonic acid.

quinone (1,4-benzoquinone; chinone) $C_6H_4O_2$.

Properties: Yellow crystals; irritating odor. Soluble in alcohol, ether and alkalis; slightly soluble in hot water. Sp. gr. 1.307; m.p. 115.7°C; b.p. sublimes; volatile with steam, being in part decomposed. Combustible.

Derivation: By oxidation of aniline with chromic acid, extraction with ether and distillation.

Hazard: Toxic by inhalation; strong irritant to skin and mucous membranes. Tolerance, 0.1 ppm in air.

Uses: Manufacture of dyes and hydroquinone; fungicides.

para-quinonedioxime. See "G-M-F."

quinone oxime dye. See nitroso dye.

quinosol $C_9H_6NOSO_3K \cdot H_2O$. Yellow crystalline powder. Used as a fungicide. Combustible.

quinoxaline (1,4-benzodiazine; benzo-para-diazine)

$C_8H_6N_2$ (bicyclic). An organic base.

Properties: Colorless crystalline powder; m.p. 30°C; b.p. 229°C; soluble in water and organic solvents.

Use: Organic synthesis.

quinoxalinedithiol cyclic trithiocarbonate. See thioquinox.

"Quotane."⁷¹ Trademark for an ointment and lotion containing dimethisoquin hydrochloride.

"QUSO."²⁰¹ Trademark for a series of microfine precipitated amorphous silicas having a fully hydroxylated surface.

Uses: Thickening, flattening, anti-caking, and reinforcing agent, adsorptive carrier.

R

R (1) Symbol used to represent an organic group in a chemical formula, for example, CH_3 , C_2H_5 , C_6H_5 , etc.

(2) A free radical (with superior dot, R^\cdot).

(3) The universal gas constant, equal to $p_0 v_0 / 273$.

(4) Abbreviation of Rankine temperature scale.

R & D. Abbreviation for Research and Development, usually referring to the department or division of a company whose major responsibility is applied research and creative development of new products and processes.

Ra Symbol for radium.

racemization. Conversion, by heat or by chemical reaction (e.g., enolization), of an optically active compound into an optically inactive form, in which half of the optically active substance becomes its mirror-image (enantiomer). This change results in a mixture of equal quantities of dextro- and levorotatory isomers, as a result of which the compound does not rotate plane-polarized light to either right or left since the two opposite rotations cancel each other. This is sometimes referred to as external compensation, as opposed to the internal compensation exhibited by meso- compounds. See also meso- (1); tartaric acid.

racephedrine (racemic ephedrine; *dl*-ephedrine)

$\text{C}_{10}\text{H}_{15}\text{NO}$. For optically active form, see ephedrine. Properties: Crystals; m.p. 79°C ; soluble in water, alcohol, chloroform, and oils.

Derivation: Synthetic.

Use: Medicine (also as hydrochloride and sulfate).

R acid. See 2-amino-3-naphthol-6-sulfonic acid; 2-naphthol-3,6-disulfonic acid.

2R acid. See 2-amino-8-naphthol-3,6-disulfonic acid.

rad. That quantity of ionizing radiation (q.v.) that results in the absorption of 100 ergs of energy per gram of irradiated material, regardless of the source of the radiation. The Federal radiation safety standard is 0.17 rad per person per year, and even this is considered too high by some authorities.

"Radapon."²³³ Trademark for an herbicide based on dalapon.

"Radel."²¹⁴ Trademark for a water-soluble polyethylene oxide film.

Uses: Packaging powdered detergents, dyes, insecticides, fungicides and other household, industrial, and agricultural products that are dissolved in water prior to use.

radiation. Energy in the form of electromagnetic waves (also called radiant energy, or light). It is emitted from matter in the form of photons (quanta), each having an associated electromagnetic wave having frequency (ν) and wavelength (λ). The various forms of radiant energy are characterized by their wavelength, and together they comprise the electro-

magnetic spectrum, the components of which are as follows: (1) cosmic rays (highest energy, shortest wavelength); (2) gamma rays from radioactive disintegration of atomic nuclei; (3) x-rays; (4) ultraviolet rays; (5) visible light rays; (6) infrared; (7) microwave; and (8) radio (Hertzian) and electric rays. All these are identical in every way except wavelength, those having the shortest wavelength being the most penetrating. They are not electrically charged and have no mass; their velocity of propagation is the same; all display the properties characteristic of light and have a dual nature (wave-like and corpuscular). In a looser sense the term "radiation" also includes energy emitted in the form of particles which possess mass and may or may not be electrically charged, i.e., alpha (positive) and beta (negative); also neutrons. Beams of such particles may be considered as "rays." The charged particles may all be accelerated and high energy imparted to "beams" in particle accelerators such as cyclotrons, betatrons, synchrotrons and linear accelerators.

Radiation is used in medicine in the form of x-rays and radioactive isotopes; it is used in industry in many ways, e.g., as vitamin activator, sterilizing agent, and polymerization initiator; it is also the basis of all types of spectroscopic analysis. See also following entries.

radiation biochemistry. The study of substances having the ability to protect cells and body tissue against the deleterious effects of ionizing radiation. As one of these effects is to deprive proteins of sulphydryl ($-\text{SH}$) groups necessary for cell division, the injection of compounds rich in this radical (notably cysteine) has been successfully tried with laboratory animals. Thiourea has been found to protect DNA from depolymerization by x-rays; enzymes containing $-\text{SH}$ groups inactivated by radiation are reactivated by addition of glutathione. Some of the other radiochemically induced reactions that adversely affect biochemical activity are (1) formation of hydrogen peroxide (a biological poison) by free radical mechanism; (2) denaturation of proteins; (3) change in substituent groups of amino acids; (4) oxidation of hemoglobin; (5) depolymerization of DNA. See also radiation, ionizing.

radiation, industrial. Chemical or physiochemical changes induced by exposure to various types and intensities of radiation. The reactions are of the following types: (1) synthesis of ethyl bromide from hydrogen bromide and ethylene, using gamma radiation from cobalt-60; (2) cross-linking of such polymers as polystyrene and polyethylene with either beta or gamma radiation; (3) vulcanization of rubber with ionizing radiation; (4) polymerization of methyl methacrylate monomer with cobalt-60 as source of gamma rays. Free radical formation is involved in both cross-linking and polymerization reactions. This technique is also being applied in the

textile finishing field for grafting and cross-linking fibers with chemical agents for durable-press fabrics. (5) Irradiation of foodstuffs, milk, etc., by varying dosages of radiation for the purposes of (a) sterilization, (b) pasteurization, (c) increase of Vitamin D formation, (d) inhibition of sprouting, (e) prevention of infestation of stored wheat by insects. All these must be in accordance with FDA requirements. (6) Curing or hardening of paint films on plastic, wood, metal, etc. by use of low-voltage electron beam. See also "Electrocure."

radiation, ionizing. Extremely short-wavelength, highly energetic, penetrating rays of the following types: (a) gamma rays emitted by radioactive elements and isotopes (decay of atomic nucleus); (b) x-rays, generated by sudden stoppage of fast-moving electrons; (c) subatomic charged particles (electrons, protons, deuterons) when accelerated in a cyclotron or betatron. The term is restricted to electromagnetic radiation at least as energetic as x-rays, and to charged particles of similar energies. Neutrons also may induce ionization.

Such radiation is strong enough to remove electrons from any atoms in its path, leading to the formation of free radicals (q.v.). These short-lived but highly reactive particles initiate decomposition of many organic compounds. Thus ionizing radiation can cause mutations in DNA and in cell nuclei; adversely affect protein and amino acid mechanisms; impair or destroy body tissue; and attack bone marrow, the source of red blood cells. Exposure to ionizing radiation for even a short period is highly dangerous, and for an extended period may be lethal. The study of the chemical effects of such radiation is called radiation chemistry or (in the case of body reactions) radiation biochemistry (q.v.). See also radiation, industrial; x-radiation; rad.

radical. (1) An ionic group having one or more charges, either positive or negative, e.g., OH^- , NH_4^+ , SO_4^{--} . See also group (2).

(2) See free radical.

radioactivity. Natural or artificial nuclear transformation; discovered by Becquerel in 1895. The energy of the process is emitted in the form of alpha, beta, or gamma rays. Thus radium-226 undergoes radioactive decay by the emission of an alpha particle, and the new product is radon-222. The decay series terminates in lead-206. Radioactivity is not affected by the physical state or chemical combination of the element. The radioactivity of a nuclide is characterized by the nature of the radiations, their energy, and the half-life of the process, i.e., the time required for the activity to decrease to one-half of the original. Half-lives vary from microseconds to millions of years. Some radioactive elements occur in nature (radium, uranium). Radioactivity can be caused artificially in many stable elements by irradiation with neutrons in a nuclear reactor, or by charged particles from an accelerator.

Amounts of radioactive material are usually expressed in units of activity, the rate of the radioactivity decay. The accepted unit is the curie and its metric fractions, the milli- and microcurie. A curie is 3.73×10^{10} disintegrations per second. A common unit is millicuries per millimole. Packaging and shipment of radioactive materials, which are highly toxic, must be in accord with official requirements.

"Radiocarb."¹⁵⁵ Trademark for carbonized nickel from which all the excess carbon has been removed with-

out creating a sheen. Surface has a dull black appearance.

radiocarbon. See carbon 14.

radiochemistry. That subdivision of chemistry which deals with the properties and uses of radioactive materials in industry, biology, and medicine.

radioisotope (radionuclide). An isotopic form of an element (either natural or artificial) that exhibits radioactivity. Radioisotopes are used as curative agents in medicine, in biological tracer studies, and for many industrial purposes, from measurement of thickness to initiating polymerization.

See also tracer; isotope.

radium Ra Radioactive element of Group IIA of the Periodic Table; atomic number 88; atomic weight 226.0254; valence 2; 14 radioactive isotopes, but only Ra-226 with half-life of 1620 years is usable. Discovered by the Curies in 1898.

Properties: Brilliant white solid; m.p. 700°C; b.p. 1140°C; sp. gr. 5 (approx.). Luminescent; turns black on exposure to air; soluble in water with evolution of hydrogen. Forms water-soluble compounds. Decays by emission of alpha, beta, and gamma radiation; bone-seeking.

Occurrence: Colorado, Canada, Africa (Congo), France, USSR.

Derivation: Uranium ores (pitchblende and carnotite). The method used for isolating radium is similar to that of Mme. Curie, and involves coprecipitation with barium and lead, chemical separation with HCl, and further purification by repeated fractional crystallization. The metal is separated from its salts by electrolysis and subsequent distillation in hydrogen. Containers: Dry salts are stored in sealed glass tubes, opened regularly by experienced workers to relieve pressure. The tubes are kept in lead containers.

Hazard: Highly toxic; emits ionizing radiation (q.v.). Lead shielding should be used in storage and handling; adequate protective clothing and remote control devices are essential. Destructive to living tissue. Uses: Medical treatment for malignant growths; industrial radiography; source of neutrons and radon. Shipping regulations: Consult regulations.

radium bromide RaBr_2 .

Properties: White crystals, becoming yellow or pink; radioactive. Sp. gr. 5.79; m.p. 728°C; sublimes at 900°C; soluble in water and alcohol.

Derivation: Freed from the ores as a bromide mixed with barium bromide.

Method of purification: Fractional crystallization.

Impurities: Barium salts.

Grades: Technical; pure. The purity is determined by the strength of the ionizing power of the salt, i.e., the extent to which it causes air to conduct electricity. Containers: Glass bottles; sealed tubes enclosed in sheet lead.

Hazard: See radium.

Uses: Medicine (cancer treatment); physical research.

Shipping regulations: Consult regulations.

radium carbonate RaCO_3 .

Properties: Amorphous radioactive powder, white when pure, but sometimes yellow, orange, or pink due to impurities. Insoluble in water. Marketed as a mixture with barium carbonate.

Hazard: See radium.

Use: Medicine.

Shipping regulations: Consult regulations.

radium chloride RaCl_2 .

Properties: Yellowish white crystals, becoming yellow

or pink on standing; radioactive. Soluble in water and alcohol. M.p. 1000°C; sp. gr. 4.91.

Derivation: Freed from the ores as a chloride mixed with barium chloride.

Method of purification: Fractional crystallization.

Grades: Technical; pure. The purity of radium salts is determined by the strength of their ionizing power, i.e., the extent to which they cause air to conduct electricity.

Containers: Glass bottles; sealed tubes enclosed in sheet lead.

Hazard: See radium.

Uses: Medicine (cancer treatment); physical research.

Shipping regulations: Consult regulations.

radium sulfate RaSO_4 .

Properties: White crystals when pure, but sometimes yellow, orange, or pink due to impurities. Radioactive. Insoluble in acids and water.

Hazard: See radium.

Use: Medicine.

radon Rn Gaseous radioactive element. Atomic number 86; noble gas group of Periodic Table. Atomic weight 222.02; valences 2, 4, (6); 18 radioactive isotopes, all short-lived. The 222 isotope has a half-life of 3.8 days, emits alpha radiation.

Properties: Colorless gas; density 9.72 g/l (0°C); soluble in water; can be condensed to colorless transparent liquid (b.p. -61.8°C) and to an opaque, glowing solid. The heaviest gas known.

Derivation: Radioactive decay of radium. Radon is obtained by bubbling air through a radium salt solution and collecting the gas plus air.

Hazard: See radium.

Uses: Medicine (cancer treatment); tracer in leak detection; flow rate measurement; radiography; chemical research.

Shipping regulations: Consult regulations.

raffinate. The portion of an oil that is not dissolved in solvent refining of lubricating oil.

raffinose $\text{C}_{18}\text{H}_{32}\text{O}_{16} \cdot 5\text{H}_2\text{O}$. A trisaccharide composed of one molecule each of D(+)-Galactose, D(+)-glucose, and D(-)-fructose.

Properties: White, crystalline powder; sweet taste. Soluble in water; very slightly soluble in alcohol. Sp. gr. 1.465; m.p. (anhydrous) 118° to 119°C; b.p. decomposes at about 130°C; optical rotation +104.5°. Split by invertase to melibiose and saccharose. Combustible; nontoxic.

Derivation: Hydrolysis of cottonseed meal; from sugar beet concentrates.

Uses: Bacteriology; preparation of other saccharides.

"Raldeine."²²⁷ Trademark for methyl ionones, available in several grades.

Use: Perfumery (violet odor).

Raman spectra. See spectroscopy.

ramie. A natural fiber obtained from the stems of *Boehmeria nivea*, of the hemp family. High wet strength; absorbent but dries quickly; can be spun or woven. Wears well and has great rot and mildew resistance; tensile strength four times that of flax; elasticity 50% greater than flax.

Sources: Taiwan; Egypt; Brazil; Florida.

Hazard: Combustible, not self-extinguishing.

Uses: High-grade paper (Europe); fabrics (weaving apparel and car seat covers); stern-tube packing in ships; patching watermains (Great Britain).

"Ramrod."⁵⁸ Trademark for an herbicide available as a wettable powder (contains 65% 2-chloro-N-isopropylacetanilide) and granular form (contains 20% 2-chloro-N-isopropylacetanilide).

"Randox."⁵⁸ Trademark for a liquid herbicide containing 47.1% alpha-chloro-N,N-diallylacetamide.

Raney nickel. A spongy form of nickel.

Derivation: By leaching the aluminum from an alloy of 50% aluminum-50% nickel with 25% caustic soda solution.

Hazard: Ignites spontaneously in air; store under inert gas or under water. Dangerous fire risk.

Use: Catalyst for hydrogenation.

Shipping regulations: See under nickel.

Rankine. A scale of absolute temperature based on Fahrenheit degrees. Abbreviation: R. See absolute temperature.

Raoult's law. The vapor pressure of a substance, in equilibrium with a solution containing the substance, is equal to the product of the mole fraction of the substance in the solution, and the vapor pressure of the pure substance at the temperature of the solution. The law is not applicable to most solutions, but is often approximately applicable to mixtures of closely similar substances, particularly the substance present in high concentration.

rapeseed meal. The ground press-cake left from expression or rapeseed oil. Its major use is as an animal feed ingredient, but the presence of harmful glucosides, which may be goiter-inducing, limits its application for this purpose. Research efforts are being directed to removal of this constituent from meal produced in Canada. The meal also has some use as a fertilizer. If fed to animals, it should be blended with other feeds.

rapeseed oil. A vegetable oil derived from rape by expression or solvent extraction; it is now produced chiefly in Canada. It is a viscous, brownish liquid, though when refined it is yellow. Sp. gr. 0.913-0.916; solidifies about 0°C; flash point 325°F; auto-ignition temperature 836°F; subject to spontaneous heating. It is high in unsaturated acids, especially oleic, linoleic and erucic, the latter being 40% in older varieties, but recently introduced types have much lower erucic content. It is shipped in drums and tank cars.

Uses: Edible oil for salad dressings, margarine, etc.; lubricant additive; substitute for soybean oil.

"Rapidase."¹⁷¹ Trademark for a bacterial amylase for removing starch sizings from textiles.

rare earth. One of a group of 15 chemically related elements in Group IIIB of the Periodic table (lanthanide series). Their names and atomic numbers are:

lanthanum	La	57
cerium	Ce	58
praseodymium	Pr	59
neodymium	Nd	60
promethium	Pm	61
samarium	Sm	62
europium	Eu	63
gadolinium	Gd	64
terbium	Tb	65
dysprosium	Dy	66
holmium	Ho	67

erbium	Er	68
thulium	Tm	69
ytterbium	Yb	70
lutetium	Lu	71

The elements 57-62 are known as the cerium subgroup, and 63-71 as the yttrium subgroup. Yttrium, atomic number 39, although not a rare earth element, is found associated with the rare earths and is only separated with difficulty. See also didymium.

Source: Monazite, bastnasite and related fluocarbonate minerals, as well as minerals of the yttrium group. These ores contain varying percentages of rare earth oxides, which are often loosely called rare earths. Rare earth elements also occur as fission products of uranium and plutonium, which is the only source of promethium.

Occurrence: (monazite) India, Brazil, Florida, Carolinas, Australia, South Africa; (bastnasite) California.

For properties and uses, see specific entry.

rare gas. Any of the six gases comprising the extreme right-hand group of the Periodic Table, namely, helium, neon, argon, krypton, xenon, and radon. They are preferably called noble gases or (less accurately) inert gases. The first three have a valence of 0 and are truly inert, but the others can form compounds to a limited extent.

rare metal. A loose term for the less common and more expensive metallic elements. They include the alkaline-earth metals (barium, calcium and strontium); beryllium, bismuth, cadmium, cobalt, gallium, germanium, hafnium, indium, lithium, boron, silicon, manganese, molybdenum, rhodium, selenium, tantalum, niobium, tellurium, thallium, thorium, titanium, tungsten, uranium, vanadium, zirconium, and the rare earths.

"Rareox."²⁴¹ Trademark for optical quality cerium oxide for high speed polishing.

Raschig process. See hydrazine.

"Rasorite."⁴⁴¹ Trademark for sodium borate concentrates.

"Raticate."⁵⁰⁷ Trademark for 5-(α -hydroxy- α -2-pyridylbenzyl)-7-(α -2-pyridylbenzylidene)-5-norbornene-2,3-dicarboximide. A rodenticide specific for rats; nontoxic to other animals and to man (U.S. Dept. of Agriculture).

"Raudixin."⁴¹² Trademark for rauwolfia serpentina whole root.

"Raunormine."³⁴² Trademark for deserpidine hydrochloride.

"Rau-Sed."⁴¹² Trademark for reserpine (q.v.).

"Rauserfia."³⁴² Trademark for an extract of weakly basic alkaloids from Rauwolfia.

rauwolfia. The powdered whole root of Rauwolfia serpentina. The plant is of value as a source of alkaloids, especially reserpine (q.v.).

Properties: Light tan to light brown, bitter, fine, amorphous powder; slight aromatic odor. Sparingly soluble in alcohol and very slightly soluble in water.

Grade: N.F.

Containers: Barrels; drums.

Use: Medicine (antihypertensive agent).

rayon. Generic name for a semisynthetic fiber composed of regenerated cellulose, as well as manufactured fibers composed of regenerated cellulose in

which substituents have replaced not more than 15% of the hydrogens of the hydroxyl groups. Rayon was first made by denitration of cellulose nitrate fibers (Chardonnet process), but most rayon is now made by the viscose and cuprammonium processes. "Regular" viscose tenacity = 2 g per denier; "high-tenacity" = 3 to 6 g per denier (tire cord). Elongation 15-30% (dry) and 20-40% (wet). Swells and weakens when wet. Moisture regain 11 to 13%; sp. gr. 1.50.

Modified rayon is made principally of regenerated cellulose and contains nonregenerated cellulose fiber-forming material; for example, a fiber spun from viscose containing casein or other protein (ASTM). This greatly increases both dry and wet strength and also permits mercerization. Rayon is readily dyed by standard methods.

Hazard: Flammable; not self-extinguishing. Moderate fire risk.

Uses: Nonwoven fabrics; surgical dressings; wearing apparel; mechanical rubber goods; coated fabrics; felts and blankets; blends with cotton for home furnishings, etc.; tire cord.

See also cellophane; acetate fiber.

rayon coning oil. An oil used to lubricate and reduce the static of yarns wound by a coning machine. Usually composed of mineral oils of low viscosity, so compounded as to emulsify in water.

raw material. Any ingredient or component of a mixture or product before mixing and processing take place. Bulk storage should be planned with due regard for flammable and toxic properties, possible emergencies due to spills or container breakage, etc.

"Rayox." Trademark for titanium dioxide (q.v.).

Rb Symbol for rubidium.

"RC."⁵² Trademark for a series of plasticizers.

Uses: Electrical tapes, metal laminates, surgical tubing, gaskets, non-marring film and sheeting, organosols, plastisols, plasticizer for nitrocellulose and synthetic rubbers, mild lubricant.

"R-2" Crystals.⁵⁸ Trademark for a reaction product of carbon disulfide and 1,1'-methylene-dipiperidine. Uses: Vulcanization accelerator for natural and synthetic rubbers, mostly in cements and latex.

RDA (1) Abbreviation for Recommended Dietary Allowance of food requirements, including proteins, vitamins, and minerals, for infants, children, and adults, established by the Food and Nutrition Board of the National Academy of Sciences-National Research Council. They were revised in 1974, particularly in reference to certain vitamins (C, B₁₂ and E) and proteins. Future revisions may be expected.

(2) Abbreviation for Recommended Daily Allowance for food and nutrition established by the Food and Drug Administration to serve as a basis for regulations on nutritional labeling of food products. These were effective as of January 1, 1975, and were based on the Recommended Dietary Allowance referred to in (1).

RDGE. See resorcinol diglycidyl ether.

RDX. See cyclonite.

Re Symbol for rhenium.

reaction, chemical. See chemical reaction.

reagent. Any substance used in a reaction for the purpose of detecting, measuring, examining or analyzing other substances. High purity and high sensitivity are essential requirements of laboratory reagents.

Over 8000 reagent chemicals are commercially available. See also grade.

rearrangement. A type of chemical reaction in which the atoms of a single compound recombine, usually under the influence of a catalyst, to form a new compound having the same molecular weight but different properties. Thus ammonium cyanate in solution will rearrange to form urea, in which the four hydrogen atoms are equally distributed between the two nitrogen atoms: $\text{NH}_4\text{OCN} \rightarrow (\text{NH}_2)_2\text{C}=\text{O}$. Many such rearrangements have been named for their discoverers, e.g., Beckmann rearrangement (q.v.). See also Wöhler.

Reaumur. A temperature scale in which 0° is the freezing point of water and 80° is its boiling point.

recipe. A product formula; used primarily in the food industry.

reclaiming. See recycling (2).

recombinant DNA. Genetic material transferred from the genes of one species to those of another by uniting a portion of the DNA of one organism with extranuclear sections of DNA from another organism. Such "recombinant" molecules will replicate in the same way as in normal DNA behavior. This technique is being utilized in basic genetic research sponsored by the National Institutes of Health. Some concern has been expressed over the risks of producing abnormal and possibly dangerous species which might contaminate the ecosystem; in this regard, NIH has issued guidelines for such research. See also deoxyribonucleic acid; replication.

reconstitution. In food technology, restoration of a dehydrated food product to its original edible condition by adding water to it at the time of use. It is also called rehydration. See also dehydration.

rectification. The enrichment or purification of the vapor during the distillation process by contact and interaction with a countercurrent stream of liquid condensed from the vapor. See also reflux.

recycling. (1) As generally used in the chemical industries, this term refers to the practice of returning a portion of the reaction products to the start of the system, either for the purpose of more efficient conversion of unreacted components, or to reuse auxiliary materials that remain unchanged during processing. In the petroleum refining industry, some of the product stream may be recycled and blended with the fresh input materials to obtain a product of maximum value.

(2) In a less technical sense, the word is also used to describe the inclusion of a limited amount of comminuted waste stock in the manufacture of products such as plastics, paper, and glass. Steel from scrapped automobiles, iron from engine blocks, scrap aluminum, waste paper, etc. are recycled, though there is a definite maximum percentage that can be successfully used. If the scrap material requires chemical processing for this purpose, the more accurate term is reclaiming, for example, of rubber.

red acetate. See mordant rouge.

red arsenic. See arsenic disulfide.

"Redax."^{69,265} Trademark for N-nitrosodiphenylamine; used as a pre-vulcanization retarder for natural and synthetic rubber compounds.

red brass. Copper-zinc (brass) alloys characterized by their red color and high copper content. The term is used for several different types of brass. One ASTM classification permits 2-8% zinc, tin less than zinc, and lead less than 0.5%. Other alloys referred to as red brass include those with 75-85% copper, up to 20% zinc, and usually very small amounts of lead and tin. In one alloy possessing good machining qualities, the lead content may be as high as 10%, the tin as high as 5%.

Red brasses are widely used for decorative purposes and in plumbing and piping because of their resistance to atmospheric corrosion and dezincification.

Red dye No. 2. See amaranth; FD&C colors.

red glass. A soda-zinc glass containing a small amount of cadmium and about 1% selenium. Red may also be obtained by using cuprous oxide or gold chloride, the latter usually in the form of purple of Cassius.

"Redicote."¹⁵ Trademark for a series of compounded amines.

Containers: 55-gal drums; tank cars; tank trucks.

Uses: Cationic emulsifiers for asphalt.

red iron oxide. See iron oxide reds.

red iron trioxide. See ferric oxide.

red lake C pigment. One of a family of organic acid azo pigments prepared by coupling the diazonium salt of ortho-chloro-meta-toluidine-para-sulfonic acid with beta-naphthol. Both sodium and barium salts of the parent dye are used.

Uses: Plastics, rubber products, printing inks.

red lead. See lead oxide, red.

red liquor. See mordant rouge.

red ocher. See ocher.

red oil. A commercial grade of oleic acid comprised of 70% oleic and 15% each of linoleic and stearic acids.

redox. Short form of the term oxidation-reduction, as in redox reactions, redox conditions, etc. See also oxidation.

red oxide. See iron oxide red.

red phosphorus. See phosphorus.

reduced states. See corresponding states.

"Reducolite."¹⁵⁹ Trademark for a sodium zinc sulfoxylate formaldehyde compound used in stripping dyed colors from wool and synthetics.

reduction. (1) The opposite of oxidation. Reduction may occur in the following ways: (1) Acceptance of one or more electrons by an atom or ion; (2) removal of oxygen from a compound; (3) addition of hydrogen to a compound. See oxidation.

(2) See comminution.

refinery gas. A mixture of hydrocarbon gases (and often some sulfur compounds) produced in large-scale cracking and refining of petroleum. The usual components are hydrogen, methane, ethane, propane, butanes, pentanes, ethylene, propylene, butenes, pentenes, and small amounts of other components such as butadiene.

Use: Source of raw material for petrochemicals, high-octane gasoline, and organic synthesis of alcohols.

"Refinex."⁹⁸ Trademark for a specially processed grade of attapulgite clay.

Uses: Bleaching, neutralizing and deodorizing agent in the re-refining of engine and lubricating oils by the contact method.

refining. Essentially a separation process whereby undesirable components are removed from various types of mixtures to give a concentrated and purified product. Such separation may be effected (a) mechanically, by pressing, centrifuging, filtering, etc.; (b) by electrolysis; (c) by distillation, solvent extraction or evaporation; and (d) by chemical reaction. One or more of these operations is applied to (1) food products; (2) petroleum; (3) lubricating oils; and (4) metals. As regards petroleum, refining is generally understood to include not only fractional distillation of crude oil to naphthas, low-octane gasoline, kerosine, fuel oil, and asphaltic residues, but also the processes involved in thermal and catalytic cracking (hydroforming, reforming, etc.) for production of high-octane gasoline. See also specific entries.

reflux. In distillation processes in which a fractionating column is used, the term reflux refers to the liquid that has condensed from the rising vapor and allowed to flow back down the column toward the still. As it does so, it comes into intimate contact with the rising vapor, resulting in improved separation of the components. The separation resulting from contact of the countercurrent streams of vapor and liquid is called rectification or fractionation.

reforming. Decomposition (cracking) of hydrocarbon gases or low-octane petroleum fractions by heat and pressure, either without a catalyst (thermoforming) or with a specific catalyst (molybdena, platinum). The latter method is the more efficient and is used almost exclusively in the U.S. The chief cracking reactions are (1) dehydrogenation of cyclohexanes to aromatic hydrocarbons; (2) dehydrocyclization of certain paraffins to aromatics; (3) isomerization, i.e., conversion of straight-chain to branched-chain structures, as octane to isooctane. These result in substantial increase in octane number. Steam reforming of natural gas is an important method of producing hydrogen; steam reforming of naphtha is used to produce synthetic natural gas. See also hydroforming; "Platforming."

"Refractaloy."³⁰⁸ Trademark for a nickel-cobalt-chromium-molybdenum-iron alloy. Type 26 is a precipitation-hardenable material using titanium as the hardening agent, and having high strength, high ductility, and corrosion resistance up to 1450°F. Gas turbine discs, bolting and blading are typical applications.

refraction. The change in direction (apparent bending) of a light ray passing from one medium to another of different density, as from air to water or glass. The ratio of the sine of the angle of incidence to the sine of the angle of refraction is the index of refraction of the second medium. Index of refraction of a substance may also be expressed as the ratio of the velocity of light in a vacuum to its velocity in the substance. It varies with the wave length of the incident light, temperature and pressure. The usual light source is the D line of sodium, the standard temperature being 20°C; the expression of refractive index is $n_D(20)$.

refractive index. See refraction.

refractory. (1) An earthy, ceramic material of low thermal conductivity that is capable of withstanding extremely high temperature (3000-4000°F) without essential change. There are three broad groups of these: (a) acidic (silica, fireclay); (b) basic (magnesite, dolomite); and (c) amphoteric (alumina, carbon, and silicon carbide). Their primary use is for lining steel furnaces, coke ovens, glass lehrs, and other continuous high-temperature applications. They are normally cast in the form of brick and are sometimes bonded to assure stability. The outstanding property of these materials is their ability to act as insulators. The most important are fireclay (aluminum silicates); silica; high alumina (70-80% Al_2O_3); mullite (clay-sand); magnesite (chiefly MgO); dolomite ($CaO-MgO$); forsterite ($MgO-sand$); carbon; chrome ore-magnesite; zirconia; and silicon carbide. See also specific entries.

(2) Characterizing the ability to withstand extremely high temperature, e.g., tungsten and tantalum are refractory metals; clay is a refractory earth; ceramics are refractory mixtures.

"Refrasil."¹⁶¹ Trademark for a group of materials having outstanding high-temperature resistance. Composed of white, vitreous fibers having up to 99% silicon dioxide content. Available as bulk fiber, batt, cloth, tape, sleeving, yarn, cordage, and flakes.

Uses: Aircraft and industrial applications; missiles.

"Refrax."²⁸⁰ Trademark for silicon nitride-bonded silicon carbide refractories. Available in brick and precision-formed shapes and parts.

Uses: Brazing and furnace fixtures; pumps and pump parts handling corrosive, abrasive slurries; rocket motor components; spray nozzles; burners; pyrometer protection tubes; sinker assemblies in wire aluminumizing; bolts and nuts; valve parts; aluminum melting furnace linings and parts; conveyor parts.

"Refrex."²¹⁴ Trademark for a blend of alcohols for refrigerator car-heating fuels.

refrigerant. Any substance which, by undergoing a change of phase (solid to liquid or liquid to vapor), lowers the temperature of its environment because of its latent heat. Melting ice, with latent heat of 80 calories per gram, removes heat and exerts a considerable cooling effect. Most commercial refrigerants are liquids whose latent heat of vaporization results in cooling. Ammonia, sulfur dioxide, and ethyl or methyl chloride were once widely used. However, the flammability and toxicity of these compounds led to a search for safer refrigerants that resulted in the discovery of halogenated hydrocarbons, especially fluorocarbons, which are nonflammable. Under various trademarks, these are now generally used for domestic refrigeration and air-conditioning. Ice and circulating brine are still used for preservation of fish at sea, and ammonia systems are operated for seafood storage in warehouses. See also "Freon"; "Ucon"; "Genetron"; fluorocarbon.

"Regl."²⁷⁵ Trademark for a group of oil furnace carbon blacks for rubber, paints, plastics, etc.

regeneration. (1) Restoration of a material to its original condition after it has undergone chemical modification necessary for manufacturing purposes. The most common instance is that of cellulose for rayon production. The wood pulp used must first be converted to a solution by reaction with sodium hydroxide and carbon disulfide; in this form (cellulose xanthate) it can be extruded through spinnerets.

After this operation it is regenerated to cellulose by passing it through acid (viscose process). Collagen can also be regenerated by acid treatment after it has been purified for use in food products by alkaline solution.

(2) Renewal or reactivation of a catalyst that has accumulated reaction residues such as coke, usually accomplished by passage of steam or reducing gases over the catalyst bed.

(3) Replenishing the sodium ions of a zeolite or similar ion-exchange agent by treatment with sodium chloride solution. Molecular sieves are regenerated by heat removal of the water (about 200°C), followed by treatment with an inert gas.

"Reagent yellows."¹⁴¹ Trademark for lightfast chrome yellow pigments.

Uses: In paints for all exterior uses; in vinyl, particularly automotive or furniture upholstery; in inks for exterior use.

rehydration. See reconstitution.

Reichert-Meissl number. A measure of volatile soluble fatty acids derived under arbitrary conditions.

Reich process. A method for purifying carbon dioxide produced in fermentation. The small amounts of organic impurities are oxidized and absorbed and the gas is then dehydrated with chemicals.

Reimer-Tiemann reaction. Reaction for the formation of phenolic aldehydes by heating a phenol with chloroform in the presence of alkali.

reinecke salt (ammonium tetrathiocyanodiammonochromate; ammonium reineckate)
 $\text{NH}_4[\text{Cr}(\text{NH}_3)_2(\text{SCN})_4] \cdot \text{H}_2\text{O}$.

Properties: Dark-red crystals or crystalline powder; moderately soluble in cold water; soluble in hot water and alcohol; decomposes in aqueous solutions.

Derivation: From fusion of ammonium thiocyanate with ammonium dichromate.

Uses: Reagent for organic bases, such as choline, amines, for certain amino acids, and for mercury.

reinforced plastic. A composite structure comprised of a thermosetting or thermoplastic resin and fibers, filaments, or whiskers of glass, metal, boron, or aluminum silicate. Unless otherwise indicated, this term refers to fiberglass-reinforced plastic (FRP).

Properties: Exceptionally high strength, good electrical resistivity, weather- and corrosion-resistance, low thermal conductivity and low flammability.

Derivation: Basic acid glass in the form of fiber (0.0005 inch), strands of 50–200 fibers, filaments, or woven fabric is coated by passing through a bath of molten resin, which acts as a binder. The assembly can be either compression- or injection- molded. Large, high-strength parts are made by filament winding (q.v.). Resins used are polyester, epoxy, phenolic, polypropylene, polystyrene, nylon, polycarbonate, and polyphenylene oxides.

Uses: Automotive body components; ablative coatings on rockets and space vehicles; appliances (air-conditioning and refrigerator cases); electrical equipment; oil-well piping and tubing; large-diameter pipe; industrial piping systems; chemical storage and mix tanks; unitized cargo containers; marine equipment; pressure vessels; prefabricated building panels and other structural components. See also glass fiber; composite; fiber; whiskers.

For further information consult the Reinforced Plastics/Composites Institute of the SPI, 250 Park Ave., New York.

reinforcing agent. (1) One of numerous fine powders used in rather high percentages to increase the strength, hardness, and abrasion resistance of rubber, plastics, and flooring compositions. The reinforcing effect is in general a function of the particle size of the powder. The finest of all is channel carbon black (q.v.) whose surface area may be as great as 18 acres per pound. Other widely used reinforcing agents are thermal and furnace blacks, magnesium carbonate, zinc oxide, hard clays (kaolin), and hydrated silicas. Though some reinforcing agents have positive coloring properties, the term should not be used as a general synonym for pigment. (See also pigment, filler).

(2) Fibers, fabric or metal insertions in plastics, rubber, flooring, etc. for the purpose of imparting impact strength and tear resistance. (See also whiskers).

relaxin. A polypeptide hormone.

Properties: Amorphous powder. Slightly soluble in water and alcohol; soluble in acid or alkaline solutions. Insoluble in absolute alcohol, ether, acetone, benzene. Decomposes above pH 9.0.

Derivation: Obtained commercially from pregnant sows' ovaries. Isolation procedure and purification by resin chromatography.

Use: Medicine.

"Rencal."⁴¹² Trademark for sodium phytate granules (q.v.).

"Renex."⁸⁹ Trademark for a group of nonionic synthetic organic detergents, chiefly ethylene oxide esters and ethers.

"Renite."⁴⁷⁷ Trademark for a series of high-temperature lubricants, swabbing compounds, release agents, and automatic spray equipment for hot-forming glass and hot-working metals. Used to improve the quality and production of glassware products, forgings, extrusions, and die castings.

rennet. See rennin.

rennin (rennase; chymosin). The enzyme secreted by the glands of the stomach which causes curdling of milk. It has the power of coagulating 25,000 times its own weight of milk.

Properties: Yellowish white powder or as yellow grains or scales. Characteristic and slightly salty taste and peculiar odor. Slightly hygroscopic. Partially soluble in water and dilute alcohol. Nontoxic.

Derivation: From the glandular layer (inner lining) of the true stomach of the calf.

Grade: Rennet is the dried commercial extract containing the rennin.

Containers: Glass bottles; fiber cans and drums.

Uses: Medicine; pharmacy; cheese-making; coagulation of casein for plastics; food additive.

"Renografin."⁴¹² Trademark for meglumine diatrizoate injection.

"Reogen."^{37,474} Trademark for a plasticizing agent for elastomers.

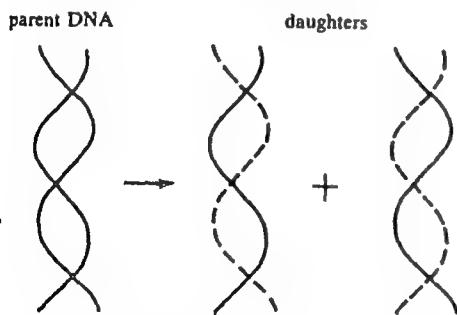

repellent. (1) A substance that causes an insect or animal to turn away from it or reject it as food. Repellents may be in the form of gases (olfactory), liq-

uids, or solids (gustatory). Standard repellents for mosquitoes, ticks, etc. are citronella oil, dimethyl phthalate, *n*-butylmesityl oxide oxalate, and 2-ethyl hexanediol-1,3. Actidione is the most effective rodent repellent, but is too toxic and too costly to use. Thiuram disulfide, amino complexes with trinitrobenzene, and hexachlorophene are successfully used. Copper naphthenate and lime/sulfur mixtures protect vegetation against rabbits and deer. Shark repellents are copper acetate or formic acid mixed with ground asbestos. Bird repellents are chiefly based on taste, but this sense varies widely with the type of bird, so that generalization is impossible. Alpha-naphthol, naphthalene, sandalwood oil, quinine and ammonium compounds have been used, with no uniformity of result. See also fumigant.

(2) A substance which, because of its physicochemical nature, will not mix or blend with another substance. All hydrophobic materials have water-repellent properties due largely to differences in surface tension or electric charges, e.g., oils, fats and waxes, and certain types of plastics. Silicone resin coatings can keep water from penetrating masonry by lining the pores, not by filling them; they will not exclude water under pressure.

replacement. See substitution.

replication. Making a reverse image of a surface by means of an impression on or in a receptive material; usually applied to microscopic techniques for obtaining plastic replicas of observed objects. In biochemistry the term refers to reproduction of the DNA molecule, which is composed of two interlocking chains of nucleotides (double helix). It reproduces itself by forming two identical daughter molecules, each of which receives one of the two chains of the original molecule, the other in each case being synthesized from nucleic acids by enzymes (DNA polymerases). In the drawing below, the solid lines are the strands of the original molecule and the broken lines are the synthesized strands:

See also deoxyribonucleic acid; genetic code.

reprography. A coined name for the technique of reproducing drawings, blueprints and typographic matter by the use of photosensitized papers, or more recently polyester sheeting, which may be coated with diazo dyes. The process has broad potential in the photocopying field and in communications technology.

Reppe process. Any of several processes involving reaction of acetylene (a) with formaldehyde to produce 2-butyne-1,4-diol, which can be converted to butadiene; (b) with formaldehyde under different conditions to produce propargyl alcohol and from this, allyl alcohol; (c) with hydrocyanic acid to yield

acrylonitrile; (d) with alcohols to give vinyl ethers; (e) with amines or phenols to give vinyl derivatives; (f) with carbon monoxide and alcohols to give esters of acrylic acid; (g) by polymerization to produce cyclooctatetraene; and (h) with phenols to make resins. The use of catalysts, of pressures up to 30 atmospheres, and of special techniques to avoid or contain explosions, are important factors in these processes. See also acetylene.

rescinnamine $C_{35}H_{42}N_2O_9$. Alkaloid from certain species of *Rauwolfia*.

Properties: White or pale buff to cream colored, odorless, crystalline powder. Darkens slowly on exposure to light, more rapidly when in solution. Soluble in chloroform and acetic acid. Slightly soluble in water; soluble in organic solvents. M.p. 238°C (in vacuum).

Grade: N.F.

Hazard: Moderately toxic.

Use: Medicine.

Research octane number. See octane number.

resene. The unsaponifiable component of rosin and other natural resins.

reserpine $C_{33}H_{40}N_2O_9$. An alkaloid.

Properties: White or pale buff to slightly yellowish, odorless powder. Darkens slowly on exposure to light, and darkens more rapidly in solution. Insoluble in water; very slightly soluble in alcohol. Soluble in chloroform and benzene. M.p. $264\text{--}265^\circ\text{C}$ (decomposes).

Derivation: From *Rauwolfia serpentina* (q.v.).

Grade: U.S.P.

Uses: Medicine, often in the form of its salts; animal feeds; antihypertensive agent.

"Reserpoid."³²⁷ Trademark for reserpine (q.v.).

residual oil. A liquid or semiliquid product resulting from the distillation of petroleum and containing largely asphaltic hydrocarbons. Also known as asphaltum oil, liquid asphalt, black oil, petroleum tailings, and residuum. Combustible.

Containers: Tank cars.

Uses: Roofing compounds; hot-melt adhesives; friction tape; sealants; heating oil for large buildings, factories, etc. See also fuel oil.

"Resilon."³²⁶ Trademark for a bituminous base lining for chemical process equipment.

Use: To resist acids and alkalis up to 150°F .

"Resimene."³²⁸ Trademark for melamine and urea-formaldehyde resins. Supplied in organic liquid solutions. The melamine is also available in water-alcohol, and soluble spray-dry powders.

Uses: Paint, varnish, lacquer for automobiles, machinery, appliances, construction; electronics, missiles; chemicals; pulp and paper.

resinate. A salt of the resin acids found in rosin (q.v.). They are mixtures rather than pure compounds. For uses, see soap (2).

"Resin C."¹⁷⁵ Trademark for a neutral synthetic coal-tar resin of high styrene content.

Properties: Light color; m.p. $115\text{--}123^\circ\text{C}$; sp. gr., approx 1.05; mineral oil cloud point, $130\text{--}150^\circ\text{C}$.

Containers: 55-gal steel drums.

Uses: To impart alkali- and grease-resistance to floor tile.

"Resinite."⁶⁵ Trademark for polyvinyl chloride film (q.v.).

resin, ion-exchange. See ion-exchange resins.

resin, liquid. An organic polymeric liquid which, when converted into its final state for use, becomes solid (ASTM). Example: linseed oil, raw or heat-bodied (partially polymerized). See also drying oil; resinoid.

resin, natural. (a) Vegetable-derived; amorphous mixtures of carboxylic acids, essential oils and terpenes occurring as exudations on the bark of many varieties of trees and shrubs. They are combustible; electrically nonconductive; hard and glassy with conchoidal fracture when cold, and soft and sticky below the glass transition point (q.v.). Most are soluble in alcohols, ethers and carbon disulfide, and insoluble in water. The best known of these are rosin and balsam, obtained from coniferous trees; these have a high acid content. Of more remote origin are such resins as kauri, congo, dammar, mastic, sandarac, and copal. Their use in varnishes, adhesives, and printing inks is still considerable, though diminishing in favor of synthetic products. (b) Miscellaneous types: Shellac (q.v.), obtained from the secretion of an Indian insect, is still in general use as a transparent coating. Amber (q.v.) is a hard, polymerized resin that occurs as a fossil. Ester gum (q.v.) is a modified rosin. Amorphous sulfur is considered an inorganic natural resin. Liquid resins, sometimes called resinoids (q.v.), are represented by linseed and similar drying oils. See also gum, natural (note); resin, synthetic (note).

resinography. The science of the morphology, structure, and related descriptive characteristics, as correlated with composition or treatment and properties or behavior, of resins, polymers, plastics, and their products.

resinoid. Any thermosetting synthetic resin, either in its initial temporarily fusible state or its final infusible state (ASTM). Heat-bodied linseed oil, partially condensed phenol-formaldehyde, and the like, are also considered resinoids.

resinol. A coal-tar distillation fraction containing phenols. It is the fraction soluble in benzene but insoluble in light petroleum, obtained by solvent extraction of low temperature tars or similar materials. Resinols are very sensitive to heat and oxidation.

"Resinox."⁴⁰ Trademark for a series of phenolic resins, supplied in various forms suitable for applications as bonding agents for shell molding and as core binders for metal casting; impregnants or bonding materials for grinding wheels, brake linings, insulation and similar industrial uses; as pipe linings, air conditioning equipment coatings; special primers; as laminating, bonding, impregnating resins for paper, fibers, for use in can, drum, and tank car linings requiring a high degree of chemical and solvent resistance, and for heavy duty products, such as equipment housings. Special formulations for high temperature use for space technology.

resin, synthetic. A man-made high polymer (q.v.) resulting from a chemical reaction between two (or more) substances, usually with heat or a catalyst. This definition includes synthetic rubbers, siloxanes, and silicones, but excludes modified, water-soluble polymers (often called resins). Distinction should be made between a synthetic resin and a plastic (q.v.); the former is the polymer itself, whereas the latter

is the polymer plus such additives as fillers, colorant, plasticizers, etc.

The first truly synthetic resin was developed by Baekeland (q.v.) in 1911 (phenol-formaldehyde). This was soon followed by a petroleum-derived product called coumarone-indene, which did indeed have the properties of a resin (see "Cumar"). The first synthetic elastomer was polychloroprene (1931) originated by Nieuwland, and later called neoprene. Since then many new types of synthetic polymers have been synthesized, perhaps the most sophisticated of which are nylon and its congeners (polyamides, by Carothers, q.v.) and the inorganic siloxane group (Kipping). Other important types are alkyds, acrylics, aminoplasts, polyvinyl halides, polyester, epoxies and polyolefins.

In addition to their many applications in plastics, textiles, and paints, special types of synthetic resins are useful as ion-exchange media (q.v.). See also plastic; paint; fiber; film; elastomer.

Note: Because the term "resin" is so broadly used as to be almost meaningless, it would be desirable to restrict its application to natural organo-soluble, hydrocarbon-based products derived from trees and shrubs. But in view of the tendency of inappropriate terminology to "gel" irreversibly, it seems like a losing battle to attempt to replace "synthetic resin" with the more precise "synthetic polymer."

See also note under gum, natural.

"Resipon."⁴¹ Trademark for a series of textile resin finishes.

BC: Methylated urea-formaldehyde type.

C: Standard urea-formaldehyde type.

NC: Ethylene urea type.

NDC: Cyclic urea type, for wash and wear finishes.

ST: Triazone type.

V: Polyvinyl acetate emulsion.

RF: Solubilized alkyl type.

resist. A material which will prevent the fixation of dye on a fiber, thus making color designs and pattern prints possible. The resist may act mechanically, as a wax, resin or gel which prevents absorption of the dye, or it may act chemically to neutralize either the dye or its accompanying mordant. Citric acid, oxalic acid, and various alkalis are among the more common resists of the chemical type.

"Resistox."⁴² Trademark for sodium oxacillin.

resistor composition. A specially treated semiconducting metal powder compounded with glass binders and temporary organic carriers. Can be applied to glass or ceramic surfaces by stenciling, spraying, brushing or dipping; firing range 1200° to 1400°F. Compositions can be blended with members of the same series to produce intermediate resistance values. Fired resistors have good reproducibility, low temperature and voltage coefficients, and stability to abrasion, moisture, and relatively high (125°C) ambient temperature.

Containers: 1- to 32-oz jars

Uses: To produce fired-on resistor components for electronic circuits

"Resistox."⁴³ Trademark for stabilized grades of copper powder assaying a minimum of 99% copper with a specific gravity of 8.9 and apparent density range of 2.0-3.5 grams per cubic centimeter. Marketed in several grades of various particle sizes.

Uses: Fabrication of porous bearings; sintered ferrous machine parts; catalysts; magnesium chloride cements; metal friction surfaces; electric brushes; electrical contacts; metallic paints.

"Resitan."³⁰⁰ Trademark for a synthetic tanning agent of the phenolic type with improved light fastness.

resite. See C-stage resin.

resitol. See B-stage resin.

"Resloom."⁵⁸ Trademark for a series of synthetic resins. E-50 Resins. Supplied at 50% solid cyclic ethylene urea-formaldehyde resin in liquid form.

Melamine. A series of essentially monomeric melamine resins.

Use: Textile industry.

"Resmetal."⁶⁵ Trademark for a resin-metal composition which when catalyzed converts to metal-like solid. Recommended for mold making, patching, forming and general repair of metal surfaces and objects.

"Resodors."¹² Trademark for products for use in the neutralization of objectionable odors in plastics.

"Resoform."³⁰⁷ Trademark for a line of dyestuffs used for coloring plastics.

resol. See A-stage resin.

"Resolube."⁴⁸³ Trademark for a wide temperature high film strength lubricant (to -70°F) which does not have the plastic-attacking properties of most synthetic low-temperature oils.

resonance. (1) In chemistry, resonance (or mesomerism) is a mathematical concept based on quantum mechanical considerations (i.e., the wave functions of electrons); it is used to describe or express the true chemical structure of certain compounds which cannot be accurately represented by any one valence-bond structure. It was originally applied to aromatic compounds such as benzene, for which there are many possible approximate structures, none of which is completely satisfactory (see benzene). The resonance concept indicates that the actual molecular structure lies somewhere between these various approximations, but is not capable of objective representation. This idea can be applied to any molecule, organic or inorganic, in which an electron pair bond is present. The term "resonance hybrid" denotes a molecule which has this property. Such molecules do not vibrate back and forth between two or more structures, nor are they isotopes or mixtures; the resonance phenomenon is rather an idealized expression of an actual molecule which cannot be accurately pictured by any graphic device.

(2) In the terminology of spectroscopy, resonance is the condition in which the energy state of the incident radiation is identical with that of the absorbing atoms, molecules, or other chemical entities. Resonance is applied in various types of instrumental analysis such as nuclear resonance absorption and nuclear magnetic resonance. See also absorption spectroscopy.

Note: The multiple meanings of "nucleus" and "resonance" can be a source of confusion, especially when these terms are closely associated, as in nuclear magnetic resonance and resonance of a molecular nucleus. In the first of these expressions, nucleus is used in sense (1) under nucleus, and resonance in sense (2) under resonance. In the second expression, nucleus is used in sense (3) under nucleus and resonance in sense (1) under resonance.

resorcinol (resorcin; meta-dihydroxybenzene; 3-hydroxyphenol) $C_6H_4(OH)_2$.

Properties: White crystals, becoming pink on exposure to light when not perfectly pure; sweet taste; sp. gr. 1.2717; m.p. 110.7°C; b.p. 281°C; soluble in water, alcohol, ether, glycerol, cerol, benzene and amyl alcohol; slightly soluble in chloroform. Combustible. Flash point 261°F; autoignition temp. 1126°F.

Derivation: By fusing benzene-meta-disulfonic acid with sodium hydroxide.

Grades: U.S.P.; powder; resublimed; pure; reagent; technical; crude.

Containers: 25- to 350-lb fiber drums; multiwall paper bags.

Hazard: Moderately toxic. Irritant to skin and eyes.

Uses: Resorcinol-formaldehyde resins; dyes; pharmaceuticals; cross-linking agent for neoprene; rubber tackifier; adhesives for wood veneers and rubber-to-textile composites; medicine; manufacture of styphnic acid.

resorcinol acetate (resorcinol monoacetate)

$HOC_6H_4OCOCH_3$.

Properties: Viscous, pale yellow or amber liquid with a faint odor and a burning taste. B.p. about 283°C (dec); boiling range (10 mm); 150-153°C. Saturated solution is acid to litmus. Soluble in alcohol and most organic solvents; sparingly soluble in water. Sp. gr. 1.203-1.207. Combustible. Low toxicity.

Derivation: Action of acetic anhydride on resorcinol.

Grades: C.P.; N.F.

Containers: Glass bottles; drums.

Uses: Medicine; cosmetics.

resorcinol blue. See lacmoid.

resorcinol diglycidyl ether (RDGE; 1,3-diglycidyl oxybenzene; meta-bis(2,3-epoxypropoxybenzene)

$C_6H_4(OCH_2CHOCH_2)_2$.

Properties: Straw-yellow liquid; sp. gr. 1.21 (25°C); b.p. 172°C (0.8 mm); refractive index 1.541 (n 25/D); viscosity 500 cp (25°C); flash point 350°F (COC). Combustible. Low toxicity. Miscible with most organic resins.

Use: Epoxy resins.

resorcinol dimethyl ether (dimethyl resorcinol; 1,3-dimethoxybenzene) $C_6H_4(OCH_3)_2$.

Properties: Pale straw-tint liquid; b.p. 204-212°C; sp. gr. 1.063-1.066 (25/25°C); refractive index (n 20/D) 1.523-1.527. Combustible. Low toxicity.

Uses: Organic intermediate; flavoring.

resorcinol-formaldehyde resin. A type of phenol-formaldehyde resin. Permanently fusible; soluble in water, ketones, and alcohols. By dissolving and adjusting the pH to 7, an adhesive base is formed. These adhesives can be used whenever phenolics are used and where fast or room-temperature cure is desired. An important use of these adhesives is in wood gluing, particularly marine plywood.

resorcinol monobenzoate $C_6H_5COOC_6H_4OH$.

Properties: White, crystalline solid; m.p. 132-135°C; b.p. 140°C (0.15 mm); insoluble in water, benzene, di-(2-ethylhexyl)phthalate. Soluble in acetone and ethanol. Combustible. Low toxicity.

Uses: Noncoloring ultraviolet inhibitor for various plastics; color stabilizer in cosmetic compositions.

resorcinolphthalein. See fluorescein.

resorcinolphthalein sodium. See uranine.

alpha-resorcylic acid (3,5-dihydroxybenzoic acid)
(OH)₂C₆H₃COOH.

Properties: White crystals, m.p. 237°C. Soluble in water, ethanol and ether. Combustible. Low toxicity. Grade: C.P.

Uses: Intermediate for dyes; pharmaceuticals; light stabilizers; resins.

beta-resorcylic acid (BRA; 2,4-dihydroxybenzene carboxylic acid; 2,4-dihydroxybenzoic acid; 4-hydroxysalicylic acid; 4-carboxyresorcinol)

(OH)₂C₆H₃COOH.

Properties: White needles; m.p. (with decomposition) 219–220°C; b.p., decomposes; almost insoluble in water and benzene; soluble in alcohol, ethyl ether. The sodium, potassium, ammonium, calcium and barium salts are soluble in water; the silver, lead and copper salts are only slightly soluble. Combustible. Low toxicity.

Containers: 100-lb net nonreturnable fiber drums.

Uses: Dyestuff and pharmaceutical intermediate; chemical intermediate in synthesis of fine organic chemicals.

respiration. (1) In man and animals, inhalation of oxygen and exhalation of carbon dioxide; the oxygen supports the oxidation (combustion) of organic nutrients in the body, yielding energy, carbon dioxide and water. (2) In growing plants, respiration occurs in both the presence and the absence of light. Some of the energy produced in respiration is used to form adenosine triphosphate, pyruvic acid, and other metabolic intermediates. Fruits and vegetables continue to respire after harvest, a fact that must be taken into account in transportation and storage.

"Reswax."⁶⁵ Trademark for a series of wax-resin blends used as coatings and hot melt adhesives in paper conversion. The polymers used include butyl rubber, polyisobutylene, chlorinated rubber, polyethylene, and styrene co-polymers.

"Resyn."⁵¹ Trademark for a series of synthetic resin-base adhesives and coatings.

ret. To reduce or digest fibers, especially linen, by enzymatic action.

retarder. See inhibitor.

"Retardion."²³³ Trademark for an ion-exchange resin used in ion retardation, a separation process in which the flow of ions through a column is retarded by the ion-absorbing properties of the resin.

"Retardsol."¹⁰⁶ Trademark for a petroleum solvent (solvent naphtha).

Hazard: Highly flammable, dangerous fire risk.

"Reten" 205.²⁶⁶ Trademark for a strongly cationic, high molecular weight, synthetic, water-soluble polymer. A finely divided white powder; dissolves in either hot or cold water to produce clear, smooth, viscous, nonthixotropic solutions. Available in a variety of viscosity grades and cationic functionality.

"Reten" 763 is an aqueous solution of a modified polyamide-epichlorohydrin resin.

Uses: Flocculant, binder and viscosifier.

retinal. Preferred name for retinene.

retinene (vitamin A aldehyde; retinal) C₂₀H₂₈O. A necessary component of rhodopsin, the light-sensitive pigment of the eye. Retinene is the aldehyde form of vitamin A, which is an alcohol.

retinol (1) C₂₀H₃₂OH. A component of vitamin A. See also carotene.

(2) A resin distillate similar to rosin oil (q.v.).

retorting. A process much used in the early years of chemistry for destructive distillation of heavy organic liquids and for laboratory separations. It involves the use of a cylindrical vessel made of glass (for laboratory work), fireclay or metal, with a neck bent at a downward angle to facilitate distillation. For gas manufacture the equipment is built on a heavier scale to handle destructive distillation of coal. Use of this term has been revived in current developments for processing shale oil (q.v.).

"Retrol."²¹⁷ Trademark for an acid-activated clay used as decolorizing adsorbent for refining used crankcase or other industrial oils. See also "Filtrol."

reverse osmosis. See osmosis; desalination.

reversible. (1) A chemical reaction which proceeds first to the right and then to the left when the ambient conditions are changed; the product of the first reaction decomposes to the original components as a result of different conditions of temperature or pressure. Examples are: H₂O + CO₂ ⇌ H₂CO₃, in which the carbonic acid reverts to water and carbon dioxide on heating; NH₄Cl ⇌ NH₃ + HCl, in which the ammonium chloride decomposes on heating to ammonia and hydrogen chloride, which recombine on cooling.

(2) A colloidal system such as a gel or suspension that can be changed back to its original liquid form by heating, addition of water, or other method. For example, evaporated egg white can be restored (reconstituted) by addition of water.

"Reversil."⁴²⁵ Trademark for an inert hydrophobic chromatography powder, designed as a reversed-phase column support or thin-layer powder.

reversion. The softening and weakening of a natural rubber vulcanizate when the curing operation has been too long continued.

"Rexforming."⁴¹⁶ A proprietary process combining certain of the elements of the "Platforming" process (q.v.) and "Udex" extraction (q.v.) to convert a naphtha fraction into a highly aromatic motor fuel blending component of high octane rating.

"Rex" (Molybdate) Oranges and Reds.²⁵⁶ Trademark for coprecipitations of normal lead chromate, lead sulfate, and lead molybdate. Used in pigments.

"R/Ex" Neutron Activation Foils and Flux Wires.⁴ Trademark for about 50 types of foils and wires made of appropriate very pure metals and alloys for neutron activation and other uses requiring high-purity material.

"R/Ex" Neutron Gamma Shielding Materials.⁴ Trademark for a group of materials composed of uniform mixtures of heavy metals in a hydrogen-containing base, to be used as shields against neutrons and gamma rays from nuclear reactors, particle accelerators, and other radiation sources. The hydrogen-containing base material is generally polyethylene, but epoxy, rubber or paraffin are also used. Boron may be added for neutron capture. Lead is generally used for gamma attenuation.

Reynold's number. The function DUP μ used in fluid flow calculations to estimate whether flow through a pipe or conduit is streamline or turbulent in nature

D is the inside pipe diameter, U is the average velocity of flow, P is density and μ is the viscosity of the fluid. Different systems of units give identical values of the Reynold's number, and values much below about 2100 correspond to streamline flow, while values above 3000 correspond to turbulent flow.

"Rezad."¹¹ Trademark for resorcinol derivatives and resins.

"Rezipas."⁴¹² Trademark for aminosalicic acid resin.

"Rezklad."⁴¹ Trademark for epoxy-based flooring compound, grout, and cements. Gives corrosion-proof, strong, abrasion-resistant surfaces.

"Rezyl."¹¹ Trademark for short, medium, and long oil semioxidizing or oxidizing types of alkyl resins; also short nonoxidizing types; nondrying plasticizing types; specialty formulations.

Uses: Baking enamels, interior and exterior brushing enamels, air dry finishes, nitrocellulose lacquers.

Rf Symbol for rutherfordium (element 104).

RFNA. Abbreviation for red fuming nitric acid. See nitric acid, fuming.

Rh Symbol for rhodium.

rhamnose $C_6H_{12}O_5$. A deoxyhexose monosaccharide found combined in the form of glycosides in many plants. Two forms exist, alpha- and beta-, of which the alpha- is the more stable.

Properties: White crystalline powder. Very soluble in water and in methanol; soluble in absolute alcohol; m.p. 82-92°C (alpha- form converts partially to the beta- form on heating). For equilibrium mixture optical rotation +9.18°.

Uses: Synthetic sweetener research.

rhennium Re Metallic element, atomic number 75; group VIIB of the periodic table. Atomic weight 186.2; valences 1 to 7; 4, 6, and 7 are most common, the last being the most stable. There are two isotopes.

Properties: Silver-white solid or gray to black powder; sp. gr. 21.02 (20°C); m.p. 3180°C; b.p. 5630°C; tensile strength 80,000 psi; high modulus of elasticity. Attacked by strong oxidizing agents (nitric and sulfuric acids). Practically insoluble in hydrochloric acid. Retains its crystal structure all the way to its melting point; has widest range of valences of any element. Rhenium-molybdenum alloys are superconductive at 10°K. Not attacked by sea water. Non-toxic.

Source: Principally molybdenite.

Derivation: Solutions from refinery residues (molybdenum ore flue dust, copper ore treatment) are (a) concentrated by salting-out processes and reduced by hydrogen gas under pressure to give the metal or (b) passed through an anionic resin from which pure rhenium can be extracted by a strong mineral acid. Forms: Powder which can be consolidated into rods, wires, or strips by powder metallurgy. Annealed metal is very ductile, and can be bent, coiled, or rolled. Single crystals 2 in. \times .05-.005 in. dia.

Hazard: Flammable in powder form.

Uses: Additive to tungsten- and molybdenum-based alloys; electronic filaments; electrical contact material; high-temperature thermocouples; igniters for flash bulbs; refractory metal components of missiles; catalyst; plating of metals by electrolysis and vapor-phase deposition.

rhennium heptasulfide Re_2S_7 .

Properties: Brown-black solid; sp. gr. 4.87; decomposes to ReS_2 at 600°C. Insoluble in water; dissolves in solutions of alkali sulfides.

Hazard: Ignites on heating in air.

Use: Catalyst.

rhennium heptoxide Re_2O_7 .

Properties: Yellow crystalline solid; sp. gr. 6.103; m.p. approx. 297°C. Dissolves in water to form per-rhennic acid $HReO_4$ (q.v.). Very soluble in alcohol.

rhennium pentachloride $ReCl_5$.

Properties: Dark green to black solid; sp. gr. 4.9; decomposes on heating. Decomposes in water; soluble in hydrochloric acid and alkalis.

Derivation: By reacting rhennium heptoxide with carbon tetrachloride at 400°C.

rhennium trichloride $ReCl_3$.

Properties: Dark red solid; on heating emits green vapor from which the metal may be deposited; non-electrolyte in solution. Soluble in water and glacial acetic acid.

Derivation: Distillation of rhennium pentachloride.

rhennium trioxychloride ReO_3Cl .

Properties: Colorless liquid; sp. gr. 3.867 (20/4°C); m.p. 4°C; b.p. 131°C (760 mm). Decomposes in water; soluble in carbon tetrachloride; reacts readily with organic substances.

rheology. Science of the deformation and flow of matter in terms of stress, strain and time. See liquid, Newtonian; dilatancy, thixotropy, and viscosity. Has important bearing on the behavior of viscous liquids in plastic molding.

"Rheolube."⁴⁸³ Trademark for a series of low-shear thixotropic greases and semifluid instrument lubricants for use where nonspreading properties are critical.

rhesus factor (Rh factor). A substance present in the red blood cells of the rhesus monkey, and of approximately 85% of an average white American population. Those whose red cells contain this factor are termed Rh-positive; others, Rh-negative. A negative individual may develop anti-Rh antibodies, if Rh-positive red cells enter his blood; such antibodies can then agglutinate Rh-positive cells. Hemolytic reactions may thus occur following transfusion of Rh-positive blood cells into a recipient previously sensitized and having Rh antibodies in the serum. Likewise, an Rh-positive fetus may give rise to antibodies in the blood of an Rh-negative mother; the antibodies, returning into the fetus, may then produce the disease erythroblastosis fetalis. There are many subtypes of the Rh factor; these can be distinguished by serologic tests, and the laws of their inheritance have been determined.

rhizobitoxin. A recently developed broad-spectrum herbicide, which attacks young growth and new leaves but has little effect on older growth. Has low toxicity to humans (USDA).

rho acid. See anthraquinone-1,5-disulfonic acid.

rhodamine B $C_{28}H_{31}ClN_2O_3$. A basic red fluorescent dye, C.I. No. 45170, structurally related to xanthene. Properties: Green crystals or reddish violet powder. Very soluble in water and alcohol, forming bluish red, fluorescent solution; slightly soluble in acids or alkalis.

Derivation: By fusion of meta-diethylaminophenol and phthalic anhydride followed by acidification with hydrochloric acid.

Uses: Red dye for paper; also for wool and silk where brilliant fluorescent effects are desired and light-fastness is of secondary importance; analytical reagent for certain heavy metals; biological stain.

rhodamine toner. Red to maroon lakes of rhodamine dyes and phosphotungstic or phosphomolybdic acid. They have good lightfastness and are used principally in printing inks. See also phosphomolybdic pigment; phosphotungstic pigment.

rhodanates. Synonym for sulfocyanates or thiocyanates (preferred). See under the individual metals which form thiocyanates.

rhodanides. See rhodanates.

rhodanine (2-thio-4-keto-thiazolidine)

Properties: Finely crystalline; light yellow color; sp. gr. 0.868; bulk density 0.617; m.p. decomposes, often violently, 166°C; pure material, 167–168.5°C; soluble in methanol, ethyl ether and hot water.

Hazard: May explode when heated to 166°C, evolving toxic fumes.

Use: Organic synthesis (phenylalanine); laboratory reagent.

rhodinol. A mixture of terpene alcohols consisting principally of *l*-citronellol.

Properties: Colorless liquid with a pronounced rose-like odor; sp. gr. 0.860–0.880 (25°C); refractive index 1.4630–1.4730 (20°C); optical rotation –4 to –9°. Soluble in alcohol and mineral oil; insoluble in glycerin. Combustible; low toxicity.

Derivation: From Réunion geranium oil.

Grade: F.C.C.

Uses: Perfumery; flavoring agent.

rhodiny acetate. A mixture of terpene alcohol acetates consisting primarily of *l*-citronellyl acetate.

Properties: Colorless to slightly yellow liquid with a rose-like odor; sp. gr. 0.895–0.908 (25°C); refractive index 1.4530–1.4580 (20°C); optical rotation –2° to –6°. Soluble in alcohol and mineral oil; insoluble in glycerin. Combustible; low toxicity.

Derivation: Action of acetic anhydride on rhodinol in the presence of sodium acetate.

Grades: Technical; F.C.C.

Uses: Perfumery; flavoring agent.

rhodium Rh. Metallic element having atomic number 45, group VIII of the periodic system. Atomic weight 102.9055. No isotopes. Valence 3.

Properties: White solid of platinum group; sp. gr. 12.41 (20°C); m.p. 1966°C; b.p. 4500°C. Insoluble in acids and aqua regia; soluble in fused potassium bisulfate. Harder and higher-melting than platinum or palladium; highest in electrical and thermal conductivity of the platinum group. High surface reflectivity. A strong complexing agent.

Occurrence: Ontario, So. Africa, Siberia.

Derivation: Occurs with platinum, from which it is recovered during the purification process.

Forms: Produced as powder, which can be fabricated by casting or powder metallurgy techniques. Single crystals are available.

Hazard: Flammable in powder form. Tolerance (fumes and dusts) 0.1 mg per cubic meter of air, (soluble salts) 0.001 mg per cubic meter of air.

Uses: Alloy with platinum for high temperature thermocouples, furnace windings, laboratory crucibles; spinnerets in rayon industry; electrical contacts; jewelry; catalyst; optical instrument mirrors; electro-deposited coatings for metals; vacuum-deposited glass coatings; headlight reflectors.

rhodium chloride (rhodium trichloride) RhCl₃.

Properties: Brownish red powder. Soluble in solutions of alkalis and cyanides; insoluble in acids, water. B.p. 800°C (sublimes); m.p. 450–500°C (dec).

rhodochrosite MnCO₃ with partial replacement by Fe, Ca, Mg, Zn.

Properties: Light pink, rose red, brownish red or brown mineral; white streak; vitreous to pearly luster; photoluminescent. Found in veins with ores of silver, lead, copper, manganese.

Constants: Sp. gr. 3.3–3.6; Mohs hardness 3–4.

Occurrence: United States (Connecticut, New Jersey, Colorado, Montana, Nevada); Europe.

Use: Manganese ore.

rhodonite. An ore of manganese. See manganous silicate.

rhodopsin. The red-light-sensitive pigment of the eye, (visual purple) consisting of the protein, opsin, and retinene (vitamin A aldehyde). It occurs in land and marine vertebrates.

"Rhoduline."¹⁰⁷ Trademark for basic dyestuffs, used for dyeing of silk, cotton, rayon, paper, leather, lacquers, and plastics. Also used as phosphotungstic toners or lakes for printing inks, wall paper and coated paper. Characterized by exceptional brilliancy.

"Rhonite."²¹ Trademark for thermosetting modified and unmodified urea-formaldehyde condensates. Supplied as water-clear solutions and aqueous pastes. Reactive with cotton, various grades producing shrink-resistance, crease-proofing or modification of hand.

Use: Finishing of natural and synthetic fabrics.

"Rhoplox."²¹ Trademark for aqueous dispersions of acrylic copolymers. White opaque emulsions. Various grades differing in hardness, flexibility, adhesion and tack of film; some thermosetting. Produce colorless transparent films with outstanding permanence, durability, adhesion, and pigment-binding capacity. **Uses:** Emulsion paints; paper coatings and saturation; floor sealers and wax emulsions; textile-backing and finishing; bonding fibers and pigments; clear and pigmented coatings on wood and metals.

"Rhodisol."¹¹⁴ Trademark for a synthetic rhodinol compound.

"Rhothane."²¹ Trademark for an agricultural insecticide based on 1,1-bis (chlorophenyl)-2,2-dichloroethane and supplied as a wettable powder or emulsion concentrate.

"Rhozyme."²¹ Trademark for enzyme concentrates with diastatic or proteolytic activity. Buff-colored powders or liquids of fungal or bacterial origin which hydrolyze and solubilize proteins and starches. **Uses:** Densizing textile fabrics; drycleaning, liquefaction of starch paste, fermentation processes, manufacture of corn syrup, fish solubles, septic tank formulations, animal feed, meat tenderizer.

"Rhulitol."²¹ Trademark for tannic acid solution (q.v.)

"Ria."⁵¹¹ Trademark for a finely ground surface-treated urea. Also available as paste. Used as cure accelerator and activator for resins.

Rib. Abbreviation for ribose.

"Rib-Bak."⁵¹⁵ Trademark for a latex compound that can be applied as a secondary carpet backing.

riboflavin (vitamin B₂) C₁₇H₂₀N₄O₆. 7,8-Dimethyl-10-(1'-D-ribityl) isoalloxazine. A crystalline pigment, the principal growth-promoting factor of the vitamin B₂ complex. It functions as a flavoprotein in tissue respiration. A syndrome resembling pellagra is thought to be due to riboflavin deficiency.

Properties: Orange yellow crystals; bitter taste; m.p. 282°C (dec). Slightly soluble in water and alcohols, insoluble in lipid solvents, stable to heat in dry form and in acid solution; stable to ordinary oxidation; unstable in alkaline solution, and quite sensitive to light. In solution, riboflavin has an intense greenish yellow fluorescence. Nontoxic.

Units: Amounts are expressed in milligrams or micrograms of riboflavin.

Sources (Food): milk, green leafy vegetables, egg yolk, liver, enriched flour, yeast. (Commercial): distiller's residues, fermentation solubles; synthetic production (indirectly from dextrose, lactose, yeast, and whey.)

Grade: U.S.P.; F.C.C.

Uses: Medicine; nutrition; animal feed supplement; enriched flours; dietary supplement.

riboflavin 5'-phosphate (FMN; flavin mononucleotide). The phosphate ester of riboflavin (q.v.) in which the phosphate is esterified to the ribityl portion of riboflavin. It functions as a coenzyme for many flavine enzymes (q.v.). The riboflavin group has the ability to take up hydrogen atoms, thus oxidizing the substrate.

Properties (sodium salt): Yellow crystals. Much more soluble than riboflavin in water. Quite sensitive to ultraviolet light.

Derivation: By treating riboflavin with chlorophosphoric acid.

Containers (sodium salt): Fiber drums.

Use: Dietary supplement; flavor potentiator.

9-beta-D-ribofuranosyladenine. See adenosine.

ribonuclease. An enzyme which causes splitting of ribonucleic acid. Pancreatic ribonuclease, for example, cleaves only phosphodiester bonds that are linked to pyrimidine 3'-phosphates. It is a critical regulator of life processes in the cell. The first enzyme to be synthesized (1969), it is composed of 124 amino acid residues. It is one of the few proteins for which the sequence of amino acids has been elucidated (the order or sequence of amino acids is of critical importance in the functioning of enzymes, genes, and nucleotides.)

ribonucleic acid (ribose nucleic acid; RNA). Generic term for a group of natural polymers consisting of long chains of alternating phosphate and D-ribose units, with the bases adenine, guanine, cytosine, and uracil bonded to the 1-position of the ribose. Ribonucleic acid is universally present in living cells and has a functional genetic specificity due to the sequence of bases along the polyribonucleotide chain.

Four types are recognized:

(1) Messenger RNA, synthesized in the living cell by the action of an enzyme that carries out the polymerization of ribonucleotides on a DNA template region which carries the information for the primary sequence of amino acids in a structural pro-

tein. It is a ribonucleotide copy of the deoxynucleotide sequences in the primary genetic material.

(2) Ribosomal RNA, which exists as a part of a functional unit within living cells called the ribosome, a particle containing protein and ribosomal RNA in roughly 1:2 parts by weight, having a particle weight of about 3 million. (See ribosome). Messenger RNA combines with ribosomes to form polysomes containing several ribosome units, usually 5 (e.g., during hemoglobin synthesis), complexed to the messenger RNA molecule. This aggregate structure is the active template for protein biosynthesis.

(3) Transfer RNA, the smallest and best characterized RNA class. Its molecules contain only about 80 nucleotides per chain. Within the class of transfer RNA molecules there are probably at least 20 separate kinds, correspondingly related to each of the 20 amino acids naturally occurring in proteins. Transfer RNA must have at least two kinds of specificity:

(a) It must recognize (or be recognized by) the proper amino acid activating enzyme so that the proper amino acid will be transferred to its free 2'- or 3'-OH group. (b) It must recognize the proper triplet on the messenger RNA-ribosome aggregate. Having these properties, the transfer RNA accepts or forms an intermediate transfer RNA-amino acid that finds its way to the polysome, complexes at a triplet coding for the activated amino acid, and allows transfer of the amino acid into peptide linkage.

(4) Viral RNA isolated from a number of plant, animal and bacterial viruses, may be considered as a polycistronic messenger RNA. It has been shown to have molecular weights of 1 or 2 million. Generally speaking, there is one molecule of RNA per infective virus particle. The RNA of RNA virus can be separated from its protein component and is also infective, bringing about the formation of complete virus.

From article by F. J. Bollum in "Encyclopedia of Biochemistry."

See also deoxyribonucleic acid.

D-ribose-5-phosphoric acid C₅H₉O₄ · H₂PO₄. A constituent of nucleotides and nucleic acids.

Properties: The barium salt (5½H₂O) is sparingly soluble in cold water and crystallizes in hexagonal plates.

Derivation: From inosinic acid.

Use: Biochemical research.

ribosome. A ribonucleoprotein, the smallest organized structure in the cell; ribosomes occur in all cells including bacteria, fungi, algae, and protozoa. They are the central point of protein synthesis (see deoxyribonucleic acid). They contain from 45 to 60% of ribonucleic acid (RNA), the balance being proteins. Ribosome crystals have been produced; in the electron microscope these appear as sheets of black dots, each sheet (one ribosome thick) containing hundreds of ribosomes in recurring groups of four. See also ribonucleic acid.

D-ribosyl uracil. See uridine.

"Ricilan."⁴⁹³ Trademark for esters synthesized from castor oil and lanolin components. Amber viscous liquids. Used as hydrophobic emollients; pigment dispersants.

ricin. White powder. The albumin of the castor oil bean is the toxic principle. Extracted from the pressed seeds with 10% solution of sodium chloride followed by precipitation with magnesium sulfate.

Hazard: Highly toxic by ingestion; small particle in cut or abrasion, eye or nose, may prove fatal.

Use: Reagent for pepsin and trypsin.

ricinine $C_8H_8O_2N_2$. 1,2-Dihydro-4-methoxy-1-methyl-2-oxonicotinonitrile.

Properties: White crystalline alkaloid; soluble in water, chloroform and ether. M.p. 201.5°C; sublimes at 170–180°C under 20 mm pressure.

Derivation: From castor oil seeds and leaves.

Hazard: Highly toxic by ingestion.

Uses: Biochemical research.

ricinoleic acid (cis-12-hydroxyoctadec-9-enoic acid; 12-hydroxyoleic acid; castor oil acid)

$CH_3(CH_2)_7CH(OH)CH_2CH=CH(CH_2)_7COOH$. A C_{18} unsaturated fatty acid which comprises approximately 80% of the fatty acid content of castor oil.

Properties: Colorless to yellow viscous liquid; soluble in most organic solvents; insoluble in water. Sp. gr. 0.940 (27.4/4°C); m.p. 5.5°C; b.p. 226°C (10 mm); refractive index 1.4697 (20°C). Dextrorotatory. Combustible. Low toxicity.

Derivation: Saponification of castor oil.

Uses: Soaps; Turkey red oils; textile finishing; source of sebacic acid and heptanol; ricinoleate salts; 12-hydroxystearic acid.

ricinoleyl alcohol (9-octadecen-1,12-diol)

$CH_3(CH_2)_7CH(OH)CH_2CH=CH(CH_2)_7CH_2OH$.

The fatty alcohol derived from ricinoleic acid. It has a long straight chain with one double bond and one hydroxyl group in a secondary position besides the primary group on the end. Available as a 90% product.

Properties: Colorless non-drying liquid at room temperature. Iodine value 91.8%; cloud point below 10°F; boiling range 170–328°C; viscosity 51 (SSU/21°C); combustible; low toxicity.

Derivation: Reduction of acid made from castor oil.

Impurities: Oleyl and linoleyl alcohols.

Uses: Protective coatings; polyesters; plasticizers; organic synthesis, pharmaceuticals, lubricants, surface active agents.

ricinus oil. See castor oil.

"Ridzlik."^{15a} Trademark for an emulsifying agent developed for treatment of oil spills in both fresh and salt water. Claimed to have minimal toxicity to marine life and to be biodegradable.

"Rigortex."¹¹ Trademark for vinyl copolymer coating for severe corrosive conditions.

"Rila."⁴ Trademark for a group of fluorescent pigments in red, green, yellow and orange. They are based on such phosphors as zinc sulfide-cadmium sulfide, cadmium sulfide-strontium sulfide.

Uses: Printing inks, fine coatings, paints, lacquers.

"Rilsan." Trademark for nylon 11. See nylon.

ring compound. See cyclic compounds; alicyclic; aromatic; heterocyclic.

"Rio Resin."^{69,119} Trademark for a blend of resinous and protective materials.

Properties: Orange to dark red; sp. gr. 1.13 ±; softening point 54°C min.

Use: Compounding heat-resistant copolymers and corona-resistant neoprene.

ristocetin. An antibiotic produced by the fermentation of *Nocardia lurida*, a species of Actinomycetes. The antibiotic has two components, ristocetin A and ris-

tocetin B. The commercial product is a lyophilized preparation representing a mixture of A and B, of which B comprises no more than 25%.

Properties: White or tan crystals or powder. Practically odorless; freely soluble in water; practically insoluble in organic solvents.

Grade: U.S.P.

Use: Medicine.

Rittinger's law. The energy required for reduction in particle size of a solid is directly proportional to the increase in surface area. See also Kick's law.

Rn Symbol for radon.

RNA. Abbreviation for ribonucleic acid (q.v.).

roasting. Heating in the presence of air or oxygen.

Most commonly used in converting natural metal sulfide ores to oxides as a first step in recovery of metals such as zinc, lead, copper, etc. Roasting is an oxidation process. See also smelting.

"Robane."⁴¹⁵ Trademark for squalane; used for dermatologicals, topical pharmaceuticals and cosmetics.

Robison ester. See glucose 6-phosphate.

"Robuoy."⁴¹⁵ Trademark for pristane (q.v.).

"Roccal."¹⁶² Trademark for a mixture of high molecular weight alkyl benzyl dimethyl ammonium chlorides in 10 and 50% aqueous solution. The alkyl groups are straight chain C_8 to C_{18} from coconut fatty acids. Used as a germicide in the food and beverage industry, and for similar applications.

Rochelle salt. See potassium-sodium tartrate.

rock crystal. See quartz.

rocket fuel (rocket propellant). A substance or mixture that has the capacity for extremely rapid but controlled combustion, which produces large volumes of gas at high pressure and temperature. They may be either liquid, solid, or combinations of both. Liquid monopropellants are hydrogen peroxide and hydrazine, catalyzed by finely divided metals to decompose them into gases. Liquid bipropellants consist of the fuel and an oxidizer; typical fuels of this type are hydrogen, hydrazine, ammonia, and boron hydride, the oxidizers being oxygen, nitric acid, ozone, hydrogen peroxide, and water.

Solid propellants include nitrocellulose, plasticized with nitroglycerin or various phthalates; inorganic salts suspended in a plastic or synthetic rubber (e.g., "Thiokol") and containing a finely divided metal. The inorganic oxidizers used are ammonium and potassium nitrates and perchlorates.

Rockwell hardness. See hardness.

"Rodar."¹⁵⁵ Trademark for an alloy composed of nickel, 29%; cobalt, 17%; manganese, 0.30%; iron, 53.7%.

Properties: Produces a permanent vacuum-tight seal with simple oxidation procedure; resists mercury corrosion; readily machined and fabricated; can be welded, soldered, or brazed.

Forms: Wire; strip; bar.

Use: Sealing metal to hard glass.

rodenticide. A chemical used to kill rats and other rodents. See warfarin; squill.

"Rodiform."⁶⁹ Trademark for rubber accelerators supplied in the form of extruded rods or pellets.

"Rodine."³⁴² Trademark for red squill liquid extract rodenticides.

"Rodo."⁶⁹ Trademark for a series of blended essential oils used to deodorize rubber.

Roentgen, W. K. (1845-1923). German physicist who discovered x-rays in 1895 for which he was awarded the Nobel Prize in 1901. Application of these to a number of important problems in analytical chemistry was developed by the Braggs, Moseley, von Laue, and Debye and Sherrer.

roentgen (r). The international unit of quantity or dose for both x-rays and gamma rays. It is defined as the quantity of x- or gamma rays which will produce as a result of ionization one electrostatic unit of electricity of either sign in 1 cc (0.001293 g) of dry air as measured at 0°C and standard atmospheric pressure. The use of the roentgen unit has been extended to include particle radiation such as alpha and beta particles and protons and neutrons. See also rad, curie.

Rohrbach solution.

Properties: Clear, yellow liquid. Very refractive; sp. gr. 3.5.

Derivation: An aqueous solution of mercuric barium iodide.

Hazard: Highly toxic by ingestion and inhalation.

Uses: Separating minerals by their specific gravity; microchemical detection of alkaloids.

"Romark."⁴⁴⁸ Trademark for alkyd and chlorinated rubber type road-marking paints.

ronnel. Generic name for O,O-dimethyl O-(2,4,5 trichlorophenyl) phosphorothioate, $(CH_3O)_2P(S)OC_6H_2Cl_3$.

Properties: Powder or granules; m.p. 41°C. Insoluble in water; soluble in most organic solvents.

Hazard: Toxic by ingestion and inhalation. Tolerance, 10 mg per cubic meter of air. Cholinesterase inhibitor. Use may be restricted.

Use: Pesticide.

Shipping regulations: (Rail, Air) Organic phosphate, solid, n.o.s., Poison label. Not accepted on passenger planes.

"Ronopole." Oil.¹⁶⁵ Trademark for highly oxidized sulfonated castor oil.

room temperature. An interior temperature from 20 to 25°C (68 to 77°F).

"Roracyl."²⁸ Trademark for a group of soluble dyes that have good affinity and fastness properties on leather.

"Rosaldehyde."¹⁸⁸ Trademark for a synthetic floral perfume base.

rosaniline $HOC(C_6H_4NH_2)_2C_6H_3(CH_3)NH_2$. A triphenylmethane dye.

Properties: Reddish brown crystals; m.p. 186°C (dec). Soluble in acids and alcohol; slightly soluble in water.

Hazard: May be toxic.

Uses: Dye (usually as the hydrochloride); fungicide.

"Rosanlik."¹⁸⁸ Trademark for a synthetic replacement of otto of rose.

roscoelite $K_2V_4Al_2Si_6O_{20}(OH)_4$. A vanadium-bearing species of mica (q.v.). Formula variable, with V_2O_5 up to 28%. Occurs as minute scales with micaceous cleavage; dark green to brown in color; pearly luster. Mohs hardness 2.5; sp. gr. 3.0.

Occurrence: Colorado, California, Australia.

Use: Source of vanadium.

rose absolute. Pure oil of rose. The first filtrate obtained on separation of waxes from the cooled alcohol solution of rose concrete in perfume manufacture.

rose concrete. Semisolid residue, a mixture of essential oils and waxes, resulting from extraction of rose flower petals, leaves, seeds, fruit, roots, gums or bark by means of a volatile solvent.

rose oil (otto of rose oil; attar of roses; rose flower oil) Properties: Pale yellow, pale green, or pale red, transparent, essential oil; mild, sweet taste; strong, fragrant odor; semi-solid at room temperature. Sp. gr. 0.845-0.865; solidifying point 18-37°C; saponification value 10-17; acid value 0.5-3; refractive index (n 30/D) 1.457-1.463. Combustible; nontoxic.

Chief constituents: Geraniol, citronellol and phenylethyl alcohol.

Derivation: By steam distillation of the fresh flowers of *Rosa damascena*, *Rosa centifolia*, *Rosa galica* and *Rosa alba*.

Grades: Bulgarian; French; Turkish; N.F.; F.C.C.

Uses: Perfumes; flavoring.

"Rosetone."¹⁹ Trademark for trichloromethylphenylcarbinyl acetate (q.v.).

rosewood oil. See oil bois de rose.

rosin

Properties: Angular, translucent, amber-colored fragments; sp. gr. 1.08; m.p. 100-150°C; acid no. not less than 150. Flash point 370°F. Insoluble in water; freely soluble in alcohol, benzene, ether, glacial acetic acid, oils, carbon disulfide, dilute solutions of fixed alkali hydroxides. Low toxicity. Hard and friable at room temperature; soft and very sticky when warm. Combustible.

Chief constituents: Resin acids of the abietic and pimaric types, having the general formula

$C_{19}H_{29}COOH$, and having a phenanthrene nucleus. See also turpentine.

Derivation: From pine trees, chiefly *Pinus palustris* and *Pinus caribaea*. (a) Gum rosin is the residue obtained after the distillation of turpentine oil from the oleoresin tapped from living trees. (b) Wood rosin is obtained by extracting pine stumps with naphtha and distilling off the volatile fraction. (c) Tall oil rosin is a byproduct of the fractionation of tall oil (q.v.).

Grades: Virgin; yellow dip; hard; N.F. Wood rosin is grades B, C, D, E, F, FF, G, H, I, J, K, L, M, N, W-G (window-glass), W-W (water-white). The grading is done by color, B being the darkest and W-W the lightest.

Containers: Drums; multi-wall paper bags.

Uses: Hot-melt and pressure-sensitive adhesives; mastics and sealants; varnishes; ester gum; soldering compounds; core oils; insulating compounds; soaps; paper sizing, printing inks; polyesters (formed by reaction of the conjugated acids of rosin with acrylic acid, followed by reaction with a glycol). See also abietic acid.

rosin oil.

Properties: Water-white to brown liquid; viscous; odorless; strong, peculiar taste. Soluble in ether, chloroform, fatty oils and carbon disulfide; slightly soluble in alcohol; insoluble in water. Essentially decarboxylated rosin acids. Sp. gr. 0.980-1.110; iodine number 112-115.

Derivation: By fractional distillation of rosin, that portion distilling above 360°C being rosin oil.

Containers: Drums; tank cars.

Hazard: Spontaneous heating; fire risk when heated.

Uses: Lubricant; adulterant for boiled linseed oil; hot-melt adhesives; printing inks; impregnating paper for wrapping electric cables; core compounds.

rosin soap. See sodium abietate, and soap.

"Roskydal."⁴⁷⁰ Trademark for a series of unsaturated polyesters curing with peroxides for coating applications.

rosolic acid. See aurin.

"Rotalin."²⁸ Trademark for a line of spirit-soluble printing colors.
Uses: Principally in the printing of glassine and other types of paper and cellophane.

"Rotax."²⁵⁶ Trademark for a purified grade of 2-mercaptobenzothiazole.
Use: Primary accelerator for rubber.

rotenone (tubatoxin) $C_{23}H_{22}O_6$. A pentacyclic compound.
Properties: White, odorless crystals. Soluble in ether, alcohol, acetone, and other organic solvents; insoluble in water. Not compatible with alkalis. Sp. gr. 1.27 at 20°C; m.p. 163°C; strongly levorotatory in solution, specific rotation for D line, 230° in benzene, 62° in ethylene dichloride.
Grades: C. P. crystals; technical; also as extracts of derris and cube root.
Containers: Fiber drums; tins; multiwall paper sacks.
Hazard: Moderately toxic. Tolerance, 5 mg per cubic meter of air.
Uses: Insecticide (toxic to fish); flea powders; fly sprays; mothproofing agents.

"Rotoclor."⁵⁶ Trademark for ferric chloride solution with other additives specially prepared for rotogravure work. Contains 43% $FeCl_3$. Sold only in 155-lb carboys.

rouge. (1) A high-grade red pigment used as a polishing agent for glass, jewelry, etc. See also iron oxide red.
(2) A cosmetic prepared from dried flowers of the safflower.

"Rovana."⁵⁶⁵ Trademark for a thermoplastic vinylidene chloride copolymer filament in the form of a folded flat tape, offered in 300, 400 and 550 deniers.

Roxel process. A process for increasing the flame resistance of cotton by chemically modifying the fiber, i.e., by applying a formulation consisting of tetrakis(hydroxymethyl)phosphonium chloride (THPC) (q.v.), triethylamine, and urea in aqueous solution. These substances crosslink with the hydroxyl groups of the cellulose (q.v.) to form an efficient and durable protective medium. This process is used in the manufacture of blankets, curtains, bed linen and industrial safety garments.

"Royalac."²⁴⁸ Trademark for an accelerator for EPDM elastomers (q.v.).

"Royalene."²⁴⁸ Trademark for a low-cost, high-performance ethylene-propylene terpolymer.
Properties: Resistance to ozone, heat, weather, sunlight aging, steam and chemicals. Resilient at low temperatures, excellent electrical properties and can be easily colored.
Uses: Tires, automotive parts, tank cars, hoses, and insulation.

royal jelly. A complex mixture secreted by "worker" honeybees, which comprises the sole nutrient of the queen bee. It contains 31% protein, 15% carbohydrate, 15% lipid, plus vitamins. The free fatty acid portion of the lipid is a mixture of C_{10} acids.

"Royal Methyl Violet."¹⁴¹ Trademark for violet pigment produced by precipitation of the basic methyl violet dyestuff with phosphomolybdic acid.
Use: Printing inks.

"Royal Spectra."¹³³ Trademark for an impingement carbon black. Used in specialty application requiring highest blackness and reinforcing power.

"Royal Victoria Blue."¹⁴¹ Trademark for blue pigment produced by precipitation of basic Victoria Blue dye with phosphomolybdic acid. Used in printing inks and some paints.

"RPA."²⁸ Trademark for a group of peptizing agents for natural and synthetic rubber.
No. 2. 2-Naphthalenethiol, $C_{10}H_7SH$, with inert wax.
No. 3. 36% or 71% xlenethiols, $(CH_3)_2C_6H_3SH$, in an inert hydrocarbon.
No. 6. Pentachlorothiophenol, C_6Cl_5SH .

"RR-10."²⁸ Trademark for a group of mixed dixylyl disulfides, $[(CH_3)_2C_6H_3]S_2$. Used to accelerate devulcanization of natural rubber, SBR, and mixed scrap for reclaiming purposes.

RR acid. See 2-amino-8-naphthol-3,6-disulfonic acid (q.v.).

"RSR."¹⁷³ Trademark for a proteolytic enzyme preparation for removal of stains; available in powder form specifically designed for removing albuminous spots and stains from garments.

"RTV."²⁴⁵ Trademark for a family of silicone rubber compounds. RTV (room temperature-vulcanizing) rubbers have good physical properties and electrical properties similar to silicone rubber.
Uses: Sealing, caulking, encapsulating and flexible mold-making in electronic, aircraft, missile, and building industries.
See also silicone (uses).

Ru Symbol for ruthenium.

"Rubanox Red."¹⁴¹ Trademark for lithol rubine pigments of bright bluish-red shades. Composed of calcium salts of azo pigments formed when 4-aminotoluene-3-sulfonic acid is coupled with beta-hydroxynaphthoic acid.
Uses: Printing inks, paints, enamels, lacquers, rubber, plastics, wallpaper, floor coverings.

rubber. Any of a number of natural or synthetic high polymers having unique properties of deformation (elongation or yield under stress) and elastic recovery after vulcanization (q.v.) with sulfur or other cross-linking agent, which in effect changes the polymer from thermoplastic to thermosetting. The yield or stretch of the vulcanized material ranges from a few hundred to over 1000 per cent. The deformation after break, called "permanent set," is usually taken as the index of recovery; it ranges from 5 to 10% for natural rubber to 50% or more for some synthetic elastomers, and varies considerably with the state of vulcanization and the pigment loading. See also elastomer; rubber, natural; rubber, synthetic.

rubber cement. See adhesive, rubber-based.

rubber, chlorinated. An elastomer (natural rubber or a polyolefin) to which 65% of chlorine has been added to give a solid, film-forming resin. White, amorphous powder available in viscosity grades from 5 to 125 centipoises, the figures indicating viscosity of a 20% solution in toluene. Decomposes at 125°C. Soluble in aromatics; insoluble in aliphatics and alcohols. Compatible with almost all natural and synthetic resins. Chief use is in maintenance paints (marine, swimming pool, traffic, masonry, etc.). See also "Parlon," "Hypalon," rubber hydrochloride.

Hazard: Do not dry-mill chlorinated rubber with zinc oxide; mixture reacts violently at 216°C. Do not use in baked enamels.

rubber, cold. See cold rubber.

rubber fiber. Generic name for a manufactured fiber in which the fiber-forming substance is comprised of natural or synthetic rubber (Federal Trade Commission). Often the rubber is a core around which cotton or other fibers are wrapped to make an elastic yarn used for girdles, swimwear, elastic bands and tapes.

rubber, hard. A rubber compounded with from 30 to 50% by weight of sulfur and cured until an extremely hard, brittle product is formed. Lime or magnesia is used as activator. The theoretical maximum of sulfur that can combine chemically with rubber hydrocarbon is 32%. Combustible; nontoxic.

Hazard: Flammable in form of dust.

Uses: Battery boxes; tank linings; acid- and alkali-resistant equipment; combs. As dust, filler for low-cost rubber products.

rubber hydrochloride. A hydrochloride derivative, as distinct from a chlorine derivative.

Properties: Thermoplastic white powder or clear film. Odorless, tasteless, nonflammable, nontoxic. Chlorine content 29–30.5%. Soluble in aromatic hydrocarbons. Softens at 110–120°C. Films are highly resistant to moisture, oils, acids and alkalis but tend to become brittle on exposure to sunlight. The life of such films is greatly extended by the incorporation of suitable stabilizers and plasticizers.

Derivation: A solution of natural rubber is treated with anhydrous hydrogen chloride under pressure and at low temperature. After neutralization of excess hydrogen chloride the product is precipitated by the addition of ethyl alcohol.

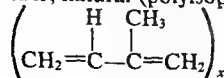

Uses: Protective coverings for machinery, rainclothing, shower curtains, food packaging.

"Rubber Lubricant RL 684."²³³ Trademark for a poly-oxyalkylene glycol formulation; used as a lubricant for mounting tires.

rubber latex. See latex.

rubber, liquid. Any of several proprietary products consisting of high polymers in liquid form for use as coatings, adhesives, etc. For manufacturers, see ^{29,222}

rubber, natural (polyisoprene, NR) (C₅H₈), or

(a) Crude (unvulcanized):

Properties: Sp. gr. 0.92. Chemically unsaturated. Amorphous when unstretched, but has oriented crystal structure on stretching. Not stable to temperature changes (thermoplastic); readily oxidizable by mastication. Soluble in acetone, carbon tetra-

chloride and most organic solvents. Refractive index 1.52; dielectric constant about 2.5. Combustible. Nontoxic. Processed by calenders and extruders; can be injection-molded with low sulfur and high accelerator. Cured by hot-molding or in open steam, at temperatures from 120 to 150°C after addition of about 3% sulfur, 1% organic accelerator, 3% zinc oxide, plus fillers or reinforcing agents. The only factors of significance in vulcanization are the time of exposure to heat and the temperature used.

Derivation: From latex (q.v.) obtained from Hevea trees; coagulated with acetic or formic acid. Also made synthetically. See "Coral," "Natsyn."

Occurrence: Malaya, Sumatra, Ceylon, Java, Brazil.

Grades: Ribbed smoked sheets; pale (yellow) crepe; brown crepe.

Containers: Burlap or polyethylene-wrapped bales; wooden boxes.

Uses: Cements, adhesives, electrical insulating tapes and cable wrapping.

(b) Cured (vulcanized, i.e., sulfur cross-linkages):

Properties: High tensile strength; relatively low permanent set; insensitive to temperature changes; attacked by heat, atmospheric oxygen, ozone, hydrocarbons and unsaturated fats and oils; insoluble in acetone; permeable to gases; supports combustion; abrasion resistance poor unless compounded with carbon black; dissipates vibration shock; high electrical resistivity.

Uses: Vehicle tires, hose, conveyor belt covers, footwear, specialized mechanical products, drug sundries, foam rubber, electric insulation, etc.

Note: Gutta percha and balata have similar chemical composition (isomeric) but have very different properties and few commercial uses.

See also latex.

rubber sponge (foam rubber; cellular rubber). A flexible foam produced by beating air into rubber latex with subsequent vulcanization, or by incorporating ammonium carbonate or sodium bicarbonate into a strongly masticated rubber stock. The heat of vulcanization releases NH₃ or CO₂, which inflates the rubber to a porous mass just before the onset of vulcanization.

Uses: Vibration damping pads and inserts; rug and carpet underlays; mattresses and upholstery; seat cushions.

rubber, synthetic. Any of a group of man-made elastomers which approximate one or more of the properties of natural rubber. Some of these are: sodium polysulfide ("Thiokol"); polychloroprene (neoprene); butadiene-styrene copolymers (SBR); acrylonitrile-butadiene copolymers (nitrile rubber); ethylene-propylene-diene (EPDM) rubbers; synthetic polyisoprene ("Coral," "Natsyn"), butyl rubber (copolymer of isobutylene and isoprene); polyacrylonitrile ("Hycar"); silicone (polysiloxane); epichlorohydrin; polyurethane ("Vulkollan").

The properties of these elastomers are widely different. All require vulcanization. In general, sulfur is used only for unsaturated polymers; peroxides, quinones, metallic oxides, or diisocyanates effect vulcanization with saturated types. Many are special-purpose rubbers; some can be used in tires when loaded with carbon black; others have high resistance to attack by heat and hydrocarbon oils and thus are superior to natural rubber for steam hose, gasoline and oil-loading hose. Most are available in latex form. For details, see specific type.

rubber, thermoplastic. Any of several block copolymers of styrene-butadiene or styrene-isoprene, re-

ported to have the resilience of rubber and the processing ease of plastics. See also block polymer.

rubeanic acid. See dithiooxamide.

rubidium Rb Metallic element of atomic number 37; group IA of the periodic table; atomic weight 85.4678. Valence 1. Has only one stable form. Principal natural radioactive isotope is rubidium 87. It is the second most electropositive and the second most alkaline element; has lowest ionization potential. Highly reactive.

Properties: Soft, silvery white solid; easily oxidized in air. Soluble in acids and alcohol; decomposes water. Sp. gr. 1.532 (20°C, as solid); m.p. 39°C; b.p. 688°C. High heat capacity and heat transfer coefficient.

Derivation: (a) Thermochemical reduction of rubidium chloride with calcium; (b) electrolysis of fused cyanide or chloride.

Source: Lepidolite, carnallite, pollucite; mineral springs and natural brines.

Grades: Technical; 99+%.

Containers: Glass bottles under naphtha or kerosine.

Hazard: Reacts vigorously with air and water; must be stored under kerosine or similar liquid. Dangerous fire and explosion risk. Metal causes serious skin burns.

Uses: Photocells; vacuum tubes; catalyst or catalyst promotor. Suggested as heat transfer fluid for vapor turbines in space vehicles; plasmas in thermoelectric devices; grain-refining agents in metals; ultrasensitive magnetometers (Rb-87).

Shipping regulations: (Air) Flammable solid label. Not acceptable on passenger planes unless in cartidges.

rubidium alum. See aluminum rubidium sulfate.

rubidium carbonate Rb₂CO₃.

Properties: White powder; m.p. 837°C; extremely hygroscopic; soluble in water. Dissociates above 900°C.

Hazard: Strong irritant to tissue.

Use: Special glass formulations.

rubidium chloride RbCl.

Properties: White, crystalline powder. Lustrous. When heated it decrepitates, melts and volatilizes. Soluble in water; almost insoluble in alcohols. Sp. gr. 2.76; m.p. 715°C; b.p. 1390°C.

Grades: Technical; C.P.; single crystals.

Use: Analysis (testing for perchloric acid); source of rubidium metal.

rubidium fluoride RbF.

Properties: White crystals; sp. gr. 3.557; m.p. 775°C; b.p. 1410°C. Soluble in water; insoluble in alcohol. Single large crystals available.

Hazard: Toxic; strong irritant to tissue. Tolerance (as F), 2.5 mg per cubic meter of air.

rubidium hexafluorogermanate Rb₂GeF₆.

Properties: White crystalline solid; m.p. approx. 696°C. Slightly soluble in cold water; very soluble in hot water.

rubidium hydroxide (rubidium hydrate) RbOH.

Properties: Grayish white mass; extremely hygroscopic; absorbs CO₂ from air; strong base. Soluble in alcohol, water. Sp. gr. 3.2; m.p. 300°C. Attacks glass at room temperature.

Hazard: Toxic; strong irritant to tissue.

Uses: Suggested for electrolyte in storage batteries for low-temperature use.

"Rubinol."³⁰⁷ Trademark for fast alizarine direct red dyestuff.

"Rubramin."⁴¹² Trademark for vitamin B₁₂ (q.v.).

ruby. Synthetic rubies, usually in the form of rods, are made from aluminum oxide containing small amounts of other metals, such as 0.05% chromic oxide, by single crystal-growing technique. These are used extensively in masers and lasers. See also corundum.

ruby glass. See glass, ruby.

"Ruelene."²³³ Trademark for organophosphorus products and formulations for use as parasiticides, insecticides, veterinary drugs and animal health products.

"Rufert."¹³⁴ Trademark for nickel catalyst for hardening margarine.

"Ruflux."³³⁷ Trademark for a series of titanium and zirconium products (potassium and sodium titanates, rutile, zirconium oxide and zircon in specially prepared forms). Used in metallurgical and welding products.

"Rulan."²⁸ Trademark for a flame-retardant plastic for electrical insulation.

rust. (1) The reddish corrosion product formed by electrochemical interaction between iron and atmospheric oxygen; ferric oxide, Fe₂O₃. The reaction occurs most rapidly in moist air, indicating the catalytic activity of water.

(2) A reddish-yellow fungus which attacks plants, especially cereal grains; it is also called smut. It can be controlled by treatment with formaldehyde.

"Rust-Ban."²⁹ Trademark for a series of protective coatings which include alkyd-based, epoxy ester-based, converted epoxy-based, oil-based, phenolic-based, silicone-based, vinyl-based and inorganic zinc coatings. The inorganic zinc coatings are primarily for heavy-duty protection of steel surfaces and are used on marine vessels and equipment, steel structures, offshore installations and heavy industrial equipment.

ruthenium Ru Metallic element of atomic number 44, group VIII of the periodic system; atomic weight 101.07; valences 3, 4, 5, 6, 8; there are 7 stable isotopes.

Properties: Silvery white solid of the platinum metal group. Sp. gr. 12.41 (20°C); m.p. 2310°C; b.p. 3900°C; Brinell hardness 220 (cast). Insoluble in acids and in aqua regia; attacked by alkaline oxidants (conc. NaOH solution), and by fused alkalis. Low toxicity.

Derivation: Occurs with platinum, from which it is recovered.

Grades: Technical; single crystals.

Uses: Hardener for platinum and palladium in jewelry; electrical contact alloys; catalyst; dental and medical instruments; corrosion-resistant alloys; electrodeposited coatings; nitrogen-fixing agent (experimental); the oxide is used to coat titanium anodes in electrolytic production of chlorine.

ruthenium chloride (ruthenic chloride; ruthenium sesquichloride) RuCl₃.

Properties: Black solid; deliquescent. Sp. gr. 3.11; decomposes above 500°C. Insoluble in cold water; decomposes in hot water. Slightly soluble in alcohol.

Grades: Technical; C.P.

Use: Analysis (testing for sulfur trioxide).

ruthenium red (ammoniated ruthenium oxychloride)
 $\text{Ru}_2(\text{OH})_2\text{Cl}_4 \cdot 7\text{NH}_3 \cdot 3\text{H}_2\text{O}$.

Properties: Brownish red powder. Soluble in water.

Uses: Microscopic stain and reagent for pectin, plant mucin and gum.

ruthenium tetroxide RuO_4 .

Properties: Yellow solid; m.p. 25°C ; b.p. 100°C .

Strong oxidizing agent.

Derivation: Acidic solutions of Ru compounds are heated with strong oxidizing agents.

Hazard: Fire risk in contact with organic materials.

ruthenocene $(\text{C}_5\text{H}_5)_2\text{Ru}$. Dicyclopentadienyl-ruthenium.

A stable, light yellow solid, m.p. 199°C . Used as an intermediate for high-temperature compounds, and for ultraviolet radiation absorbers in paints.

Rutherford, Sir Ernest (1871–1937). Born in New Zealand, Rutherford studied under J. J. Thomson at the Cavendish Laboratory in England. His work constituted a notable landmark in the history of atomic research, as he developed Becquerel's discovery of radioactivity into an exact and documented proof that the atoms of the heavier elements, which had been thought to be immutable, actually disintegrate (decay) into various forms of radiation. Rutherford was the first to establish the theory of the nuclear atom and to carry out a transmutation reaction (1919) (formation of hydrogen and an oxygen isotope by bombardment of nitrogen with alpha particles). Uranium emanations were shown to consist of three types of rays: alpha (helium nuclei) of low penetrating power; beta (electrons); and gamma, of exceedingly short wave length and great energy. Ru-

therford also discovered the half-life of radioactive elements and applied this to studies of age determination of rocks by measuring the decay period of radium to lead-206. (see Aston, Bohr).

rutherfordium. Rf Atomic number 104. Atomic wt. 261. Artificial element discovered at Lawrence Radiation Laboratory in 1969, and named after the English physicist, Sir Ernest Rutherford.

rutile TiO_2 . Natural titanium dioxide. May contain up to 10% iron.

Properties: Color red, reddish brown, to black; luster adamantine to submetallic; streak pale brown; hardness 6–6.5; sp. gr. 4.3; m.p. 1640°C ; refractive index 2.7. Insoluble in acids.

Occurrence: Virginia, West Africa, Australian beach sands.

Uses: Source of titanium and titanium compounds; ceramics; steel deoxidizer; welding rod coatings; pigment for paints, enamels and tiles.

"Rutile, Ceramic."³³⁷ Trademark for 92% titanium oxide. Light brown powder; bulk density 98 lb/cu ft; m.p. 3260°F ; particle size, less than 44 microns. Used for stable stains for ceramic glazes and bodies.

"Ryanicide."³⁴² Trademark for powdered ryania insecticide concentrates.

"Ryton."³⁰³ Trademark for a polyphenylene sulfide plastic used for coatings and molded parts.

"RZ-50-A."⁵⁸ Trademark for a 50% solution of N,N-dimethylcyclohexylamine salt of dibutyldithiocarbamic acid. Also available as "RZ-50-B" with emulsifying agents for use in latex.

Use: Rubber accelerator.

S

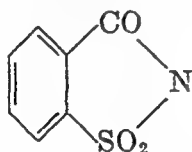

S Symbol for sulfur.

D-saccharic acid (2,3,4,5-tetrahydroxyhexanedioic acid; tetrahydroxyadipic acid) $\text{COOH}(\text{CHOH})_4\text{COOH}$. The 1,6-dicarboxylic acid formed by the oxidation of D-glucose.

Properties: White needles or syrup; very soluble in water, alcohol, or ether; deliquescent; m.p. 125–126°C with decomposition. Low toxicity. Combustible.

Derivation: Oxidation of cane sugar, glucose, starch by nitric acid.

saccharin (ortho-benzosulfimide; gluside; benzoylsulfonic imide). The anhydride of ortho-sulfimide benzoic acid. A non-nutritive sweetener.

Properties: White, crystalline powder; exceedingly sweet taste (500 times that of sucrose). M.p. 226–230°C. Soluble in amyl acetate, ethyl acetate, benzene and alcohol; slightly soluble in water, chloroform and ether.

Derivation: A mixture of toluenesulfonic acids is converted into the sodium salt, then distilled with phosphorus trichloride and chlorine to obtain the ortho-toluene sulfonyl chloride, which by means of ammonia is converted into ortho-toluenesulfamide. This is oxidized with permanganate, treated with acid and saccharin crystallized out. In food formulations saccharin is used in the form of its sodium and calcium salts. Sodium bicarbonate is added to provide water solubility.

Grades: Commercial; C.P.; U.S.P.; F.C.C.

Containers: Bottles; drums.

Uses: Manufacture of syrups; medicine (substitute for sugar); soft drinks, foods, dietetic foods, etc.

Note: Saccharin is no longer "generally recognized as safe" by FDA, which has placed limits on the percentages allowed in manufactured foods and beverages. Tests on experimental animals have not confirmed carcinogenicity.

saccharolactic acid. See mucic acid.

saccharose. See sucrose.

Sachsse process. See BASF process.

S-acid. See 1-amino-8-naphthol-4-sulfonic acid; 1-naphthylamine-8-sulfonic acid.

"Sacon."¹⁷³ Trademark for a concentrated water-soluble material used to restore sizing in dry-cleaned garments.

sacrificial protection. The preferential corrosion of a metal coating for the sake of protecting the sub-

strate metal. For example, when zinc is in contact with a more noble (less reactive) metal in the electromotive series, such as steel, a galvanic cell is created in which electric current will flow in the presence of an electrolyte. Atmospherically contaminated moisture constitutes the electrolyte. Under these conditions the zinc coating, rather than the steel is affected. Thus galvanic protection (zinc) is sometimes called sacrificial protection. See also galvanizing.

SAE. Abbreviation for Society of Automotive Engineers. The initials are applied to its specifications and tests for motor fuels, oils and steels.

SAE steel. A grade or type of steel indicated by a number system; they are principally plain carbon and of low to medium alloy content, used primarily in machine parts. The first two numbers designate either plain carbon or the alloy grouping and quantity, and the last two the mean carbon content in hundredths of 1%. Thus 10 are carbon steels; 13 manganese steels; 40 and 44 molybdenum steels (the latter of higher alloy content); 50 and 51 chromium steels (the latter of higher alloy content); 41 chromium-molybdenum; 61 chromium-vanadium; 92 silicon and silicon-chromium; 46 and 48 nickel-molybdenum (the latter of higher nickel content); and 81, 94, 86, 87, 88, 47, 43 and 93 nickel-chromium-molybdenum in the order of increasing alloy content. The letter B between the first two and last two numerals indicates the presence of boron in amounts of 0.0005 to 0.003% as a depth-hardening addition.

SAF black. Abbreviation for super-abrasion furnace black.

safety glass (shatterproof glass). A composite or laminate consisting of two sheets of plate glass with an interlayer of polyvinyl butyral. The plastic is so bonded to the glass that shattering on impact is virtually eliminated. Required for automobile windshields; also used for bullet-proof glass, train windows, etc.

"Safety-Linen Sour."²⁴⁴ Trademark for a laundering product consisting chiefly of acid fluorides.

Properties: White granular solid; soluble in water; neutralizing value 21.7 oz sodium bicarbonate per lb.

Containers: 150-lb, 300-lb net fiber drums.

Hazard: Probably toxic by ingestion.

Uses: Laundry sour, iron-removing type.

"Saffil." Trademark for a group of synthetic inorganic fibers made from alumina and zirconia.

safflower oil. Drying oil from safflower (carthamus) seed, somewhat similar to linseed oil. It is non-yellowing. Contents 78% linoleic acid (unsaturated fatty acid).

Properties: Straw-colored liquid; sp. gr. (25/25°C) 0.923–0.927; refractive index (25°C) 1.4740–1.4745; acid value 0.6–1.5; iodine no. 140–152; saponification

no. 186-193; unsaponifiable 0.3-1.0%. Combustible; nontoxic.

Derivation: Hydraulic press or solvent extraction of seeds.

Containers: Drums; tank cars.

Uses: Alkyd resins; paints; varnishes; medicine; dietetic foods; margarine; hydrogenated shortening.

"Saflex."⁵⁸ Trademark for polyvinyl butyral adhesive film supplied in clear, translucent, tinted, or graduated color, for the plastic interlayer in safety glass (q.v.).

safranine. A family of dyes, based on phenazine, having C.I. Nos. 50200-50375, some of which are useful as biological stains.

safrole (4-allyl-1,2-methylenedioxybenzene)

Properties: Colorless or pale yellow oil; the odor-giving constituent of sassafras, camphorwood and other oils; sp. gr. (15°C) 1.100-1.107; m.p. 11°C; b.p. 233°C; optical rotation (15°C) -0°30'; refractive index (n_D 20/D) 1.5363-1.5385; soluble in alcohol; slightly soluble in propylene glycol; insoluble in water and glycerin.

Derivation: From oil of sassafras or camphor oil.

Method of purification: Rectification or freezing.

Grade: Technical.

Containers: Bottles; drums.

Hazard: Toxic by ingestion. May not be used in food products (FDA).

Uses: Perfumery and soaps; manufacture of heliotropin; medicine; insecticides.

"SAG."²¹⁴ Trademark for silicone defoamers used in many industrial and chemical processes.

sage oil, clary.

Properties: Pale-yellow to light-yellow essential oil. Sp. gr. 0.886-0.929 (25/25°C); refractive index 1.4580-1.4730 (20°C).

Chief constituent: Linalyl acetate.

Derivation: Obtained by distillation of *Salvia sclarea* L. A floral absolute (solid) is obtained by volatile solvent extraction from the same plant.

Grade: F.C.C.

Uses: Perfumery; flavoring.

sage oil, Dalmatian (*salvia* oil).

Properties: Yellowish or greenish yellow liquid; has warm camphoraceous odor and flavor; sp. gr. 0.903-0.925 (25°C); refractive index 1.4570-1.4690 (20°C); optical rotation +2° to +29°. Soluble in alcohol and mineral oil; practically insoluble in glycerin.

Chief known constituents: Thujone, cineol, pinene.

Derivation: Steam distillation of partially dried leaves of *Salvia officinalis*.

Grades: F.C.C.; technical.

Uses: Medicine; perfumery; flavoring.

SAIB. Abbreviation for sucrose acetate isobutyrate.

sal ammoniac. See ammonium chloride.

salicin (salicyl alcohol glucoside)

$HOCH_2C_6H_4OC_6H_{11}O_5$. A glucoside obtained from several species of *Salix* and *Populus*.

Properties: Colorless crystals or white powder Soluble in waer, alcohol, alkalies, glacial acetic acid; insoluble in ether. M.p. 199-202°C; sp. gr. 1.43. Nontoxic.

Uses: Medicine; reagent for nitric acid.

salicylal. See salicylaldehyde.

salicyl alcohol (ortho-hydroxybenzyl alcohol; alpha, 2-dihydroxytoluene; saligenin) $HOCH_2CH_2OH$.

Properties: White crystals; m.p. 86-87°C; pungent taste; sublimes at 100°C; somewhat soluble in water; very soluble in alcohol, chloroform, ether; soluble in propylene glycol, benzene and fixed oils; sparingly soluble in cold water; soluble in hot water. Nontoxic. Combustible. Sp. gr. 1.16.

Derivation: Hydrolysis of salicin; heating phenol and methylene chloride with caustic.

Use: Medicine (antipyretic and tonic); local anesthetic.

salicyl alcohol glucoside. See salicin.

salicylaldehyde (salicylal; salicylic aldehyde; ortho-hydroxybenzaldehyde) C_6H_4OHCHO .

Properties: Colorless, oily liquid or dark red oil; bitter almond-like odor; burning taste; sp. gr. 1.165-1.172; f.p. -7°C; b.p. 196°C. Soluble in alcohol, ether and benzene; slightly soluble in water. Flash point 172°F. Combustible; low toxicity.

Derivation: Interaction of phenol and chloroform in presence of aqueous alkali.

Uses: Analytical chemistry; perfumery (violet); synthesis of coumarin; gasoline additives; auxiliary fumigant.

salicylamide (ortho-hydroxybenzamide)

Properties: White or slightly pink crystals; m.p. 139-142°C; b.p. decomposes at 270°C; soluble in hot water, alcohol, ether, chloroform; slightly soluble in cold water, naphtha, and carbon tetrachloride. Low toxicity.

Derivation: Treatment of methyl salicylate with dry ammonia gas.

Grades: Technical; N.F.

Containers: Glass bottles; drums.

Use: Medicine (analgesic).

salicylanilide $HOC_6H_4CONHC_6H_5$.

Properties: Odorless, white or slightly pink crystals. M.p. 136-138°C; b.p., decomposes; stable in air; slightly soluble in water; freely soluble in alcohol, ether, chloroform, and benzene.

Grade: N.F.

Hazard: Moderately toxic by ingestion; irritant to skin.

Uses: Medicine; fungicide; slimicide; antimildew agent; intermediate.

salicylic acid (ortho-hydroxybenzoic acid)

Properties: White powder; acrid taste; stable in air but gradually discolored by light; sp. gr. 1.443 (20/4°C); m.p. 158-161°C; b.p. about 211°C at 20 mm; sublimes at 76°C; soluble in acetone, oil of turpentine, alcohol, ether, benzene; slightly soluble in water. Combustible; low toxicity.

Derivation: Reacting a hot solution of sodium phenolate with carbon dioxide, and acidifying the sodium salt thus formed.

Grades: Technical; U.S.P.; crude.

Containers: Fiber drums.

Hazard: Dust forms explosive mixtures in air.

Uses: Manufacture of aspirin and salicylates; resins; dyestuff intermediate; prevulcanization inhibitor; fungicide.

salicylic acid dipropylene glycol monoester. See dipropylene glycol monosalicylate.

salicylic aldehyde. See salicylaldehyde.

saline water. See brine; ocean water.

salmine. A protein specific to the salmon. Used in nutritional and biochemical research.

salol. See phenyl salicylate.

sal soda (washing soda; sodium carbonate decahydrate) $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$.

Properties: White crystals; sp. gr. 1.44; m.p. 32.5–34.5°C, loses water at this temperature. Easily soluble in water; insoluble in alcohol. A pure form of sodium carbonate (soda ash). Nontoxic.

Containers: Multiwall paper sacks; carloads.

Uses: Washing textiles; bleaching linen and cotton; general cleanser.

salt. (1) The compound formed when the hydrogen of an acid is replaced by a metal or its equivalent (e.g., an NH_4 radical). Example:

This is typical of the general rule that the reaction of an acid and a base yields a salt and water. See also soap. Most inorganic salts ionize in water solution. (2) Common salt, sodium chloride, occurs widely in nature, both as deposits left by ancient seas and in the ocean, where its average concentration is 2.6%. See sodium chloride.

salt bath. A molten mixture of sodium, potassium, barium and calcium chlorides or nitrates, to which sodium carbonate and sodium cyanide are sometimes added. Used for hardening and tempering of metals, and for annealing both ferrous and nonferrous metals. Temperatures used may be as high as 2400°F for hardening high-speed steels. Commercial mixtures are available for a variety of specifications. See also fused salt.

salt cake. Impure sodium sulfate (90–99%). For properties and derivation, see sodium sulfate.

Grades: Technical; glassmakers' (iron-free).

Containers: 200-lb bags; 500-lb barrels; carloads.

Uses: Paper pulp; detergents and soaps; plate and window glass; sodium salts; ceramic glazes; dyes.

salting out. The addition of salts (usually sodium chloride) to a mixture or production batch to precipitate or coagulate proteins, soaps, or simpler organic substances.

salt, molten. See fused salt.

saltpeter. See niter, and potassium nitrate.

salt, rock. See sodium chloride.

salt, fused. See fused salt.

salvia oil. See sage oil, Dalmatian.

"Salyrgan."¹⁶² Trademark for mersalyl (q.v.).

samarium Sm A rare-earth metal of the lanthanide group (Group IIIB of the Periodic Table). Atomic number 62. Atomic weight 150.4. Valences 2 and 3. Seven stable isotopes.

Properties: Hard, brittle metal which quickly develops an oxide film in air. An active reducing agent. Ignites at 150°C; liberates hydrogen from water. Sp. gr. 7.53; m.p. 1072°C; b.p. 1900°C; hardness similar to iron. High neutron absorption capacity. Combustible.

Occurrence: Australia, Brazil, southeastern U.S. in monazite sands; South Africa. Also from bastnasite ore in California.

Derivation: Reduction of the oxide with barium or lanthanum.

Uses: Neutron absorber; dopant for laser crystals; metallurgical research; permanent magnets.

samarium chloride $\text{SmCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Faintly yellow hygroscopic crystals; sp. gr. 2.383; loses $5\text{H}_2\text{O}$ at 110°C; soluble in water.

Derivation: By treating the carbonate or oxide with hydrochloric acid.

samarium oxide Sm_2O_3 .

Properties: Cream-colored powder; sp. gr. 8.347; m.p. 2300°C. Insoluble in water; soluble in acids. Absorbs moisture and carbon dioxide from the air.

Uses: Catalyst in the dehydrogenation of ethyl alcohol; infrared-absorbing glass; neutron absorber; preparation of samarium salts.

sampling. The methods and the techniques used in obtaining representative test samples of quantity lots of raw materials, semiprocessed work, and finished product for production and quality control. Rules for sampling procedures for both solid and liquid materials have been established by the National Cottonseed Products Association, Memphis, Tenn., and by the National Institute of Oilseed Products, San Francisco, Cal. The techniques of physical sampling are only one application of statistical quality control.

SAN. Abbreviation for styrene-acrylonitrile polymer. See polystyrene.

sand. See silica.

sandalwood oil, East Indian (santalwood oil; santal oil; sandal oil).

Properties: Pale yellow, essential oil; faint, aromatic odor; harsh, resinous taste. Sp. gr. 0.965–0.980 (25°C); optical rotation -15° to -20° in 100 mm tube at 25°C; refractive index 1.50–1.51 (20°C); acid value 0.5–8.0; ester value 3–17, after acetylation, not less than 196; soluble in 3–5 vols of 70% alcohol; soluble in fixed oils; insoluble in glycerin. Combustible; nontoxic.

Derivation: Steam distillation of the wood of *Santalum album* of India.

Grades: F.C.C.; technical.

Uses: Medicine; perfumery; flavoring.

sandarac. A recent natural resin obtained from Morocco. Its commercial form is yellow, brittle, amorphous lumps or powder; soluble in alcohol; insoluble in benzene and water. Used in special types of varnishes and lacquers.

sand casting. See foundry sand.

"Sandril."¹⁰⁰ Trademark for reserpine (q.v.).

"Sandrol."⁴⁶² Trademark for a group of detergents, foam boosters, foam stabilizers, and thickeners. Made from lauric acid, coconut fatty acid, and coconut oil "Superamides"; coconut and lauric acid alkanolamides; hydrogenated coconut alkanolamide; and lauric acid isopropanolamide.

sandwich molecule. See metallocene.

"Sanforized."⁷ Trademark used for fabrics treated by a proprietary process involving water spray and steam heat which limits shrinkage to not over 1% by government standard wash test. Fabrics include all-cottons, blends, and some synthetics.

"Sangamo."⁴⁹² Trademark for snow-white powder with a clean, neutral, sweet taste. Essentially, regular corn syrup with water removed. Used as a sweetener in a variety of food products.

"Sanikleen."⁸⁴ Trademark for a germicide containing detergents and detergent builders, wetting agents, water softeners and quaternary ammonium disinfectants. Used for cleaning and disinfecting floor surfaces, porcelain eating utensils, food-handling equipment, etc.

sanitizer. A special class of disinfectant designed for use on food-processing equipment; dairy utensils; dishes and glassware in restaurants. Among them are the hypochlorites; chloramines and other organic chlorine-liberating compounds; and quaternary ammonium compounds, many of which are proprietary. See also antiseptic; disinfectant.

santal oil. See sandalwood oil, East Indian.

santalol $C_{15}H_{24}O$. A sesquiterpene alcohol.

Properties: Colorless liquid; odor of oil of sandalwood. Soluble in 3 parts of 70% alcohol. Insoluble in water; sp. gr. 0.971–0.973; refractive index 1.504–1.508; b.p. about 300°C. Combustible; low toxicity. Derivation: From sandalwood oil. Use: Perfumery.

santalyl acetate. Acetic acid ester of a mixture of alpha- and beta-santalols.

Properties: Colorless liquid, light odor of sandalwood. Sp. gr. 0.982–0.985; refractive index 1.487–1.492.

Derivation: Treatment of sandalwood oil or santalol with acetic anhydride.

Use: Perfumery.

"Santicizer."⁵⁸ Trademark for a series of plasticizers, including various sulfonamides, phthalates, and glycolates.

"Santobrite."⁵⁸ Trademark for sodium pentachlorophenate, technical (q.v.).

"Santocel."⁵⁸ Trademark for a series of silica aerogels. Uses: Anticaking flow conditioner; flattening agent; additive for drying emulsion paint films without flocculation; thixotropic and thickening of polyvinyl chloride plastisols and in various plasticizer dispersions.

"Santochlor."⁵⁸ Trademark for para-dichlorobenzene (q.v.).

"Santocure."⁵⁸ Trademark for a series of accelerators for natural and synthetic rubbers.

"Santoflex."⁵⁸ Trademark for a series of rubber antioxidants and antiozonants.

"Santolite."⁵⁸ Trademark for a group of sulfonamide resins.

"Santolube."⁵⁸ Trademark for a series of lubricating oil additives, e.g., zinc dialkyl dithiophosphate.

"Santomask" II.⁵⁸ Trademark for odor-masking ingredient for interior paints, printing inks and similar products having objectionable natural odors.

"Santomerse."⁵⁸ Trademark for a series of alkyl benzene sulfonates (biodegradable).

santonin $C_{15}H_{18}O_3$. A tricyclic structure.

Properties: White powder, turning yellow on exposure to light; odorless; tasteless at first, then bitter. Soluble in chloroform, alcohol, and most volatile and fatty oils; very slightly soluble in water. Solutions are levorotatory. Sp. gr. 1.187; m.p. 170–173°C; b.p. sublimes; specific rotation -170 to -5° (2 g/100 ml alcohol).

Derivation: By extraction from *Artemisia*.

Hazard: Moderately toxic by ingestion; affects color vision.

Grade: Technical.

Use: Medicine.

"Santophen" 1 Germicide.⁵⁸ Trademark for ortho-benzyl-para-chlorophenol.

"Santopoid."⁵⁸ Trademark for a series of gear oil additives.

"Santopour" C.⁵⁸ Trademark for pour point depressant for wax-bearing oils. See also pour point depressant.

"Santoquin."⁵⁸ Trademark for ethoxyquin (q.v.). Uses: Antioxidant in animal feeds and dehydrated forage crops.

"Santosite."⁵⁸ Trademark for sodium sulfite anhydrous, technical.

"Santotan" KR.⁵⁸ Trademark for basic chrome sulfate containing approximately 50% $Cr_2(SO_4)_3(OH)_2$. Properties: Dark green crystals; basicity (Cr_2O_3/SO_3) 101–105; basicity (Schorlemmer) 37.3–39.7; chromium as Cr_2O_3 23.9% min; clear solution in water (5:500).

Use: Chrome tanning of calf, cow and horse hides and sheepskins.

"Santovar A."⁵⁸ Trademark for 2,5-di-tert-amyldihydroquinone (q.v.).

"Santowax" R.⁵⁸ Trademark for mixed terphenyls. Yellowish-white, noncrystalline flaked solid. Used as extender for polystyrene.

"Santowhite."⁵⁸ Trademark for a series of rubber antioxidants.

saponification. The chemical reaction in which an ester is heated with aqueous alkali such as sodium hydroxide, to form an alcohol (usually glycerol), and the sodium salt of the acid corresponding to the ester. The process is usually carried out on fats, (glyceryl esters of fatty acids). The sodium salt formed is called a soap (q.v.). A typical saponification reaction is:

saponification number. The number of milligrams of potassium hydroxide required to hydrolyze 1 gram of a sample of an ester (glyceride; fat) or mixture.

saponin

(1) A general term applied to two groups of plant glucosides that on shaking with water form colloidal solutions giving soapy lathers. They also have the ability to hemolyze red blood corpuscles at very great dilutions. The two groups are triterpenoid and steroid saponins, the latter being used in research on sex hormones.

(2) Specific term; saponin derived from *saponaria* or *quillaja*.

Properties: White, amorphous glucoside; pungent; disagreeable taste and odor. It foams strongly when shaken with water. Soluble in water. Nontoxic except by injection.

Grades: Crude; purified; highest purity.

Hazard: Highly toxic by injection; destroys red blood cells.

Uses: Foam producer in fire extinguishers; detergent in textile industries; sizing; substitute for soap; emulsification agent for fats and oils.

SAPP. Abbreviation for sodium acid pyrophosphate. See sodium pyrophosphate, acid.

"SAPP #4."¹ Trademark for a sodium acid pyrophosphate.

Grade: F.C.C.

Uses: In leavening (has the slowest reaction rate of several phosphates which are otherwise chemically identical); in acid-type metal cleaners, oil well drilling muds, household and industrial cleaners.

sapphire (Al_2O_3). For natural material, see corundum. Synthetic sapphire is made by crystal-growing technique.

Properties: Hard, crystalline solid. Sp. gr. 3.98. Mohs hardness 9.0. M.p. 2040°C . Dielectric strength 480 kV/cm. Dielectric constant (20°C) 9.0. Coefficient of friction 0.05 micron. Inert to strong acids and alkalis. Excellent high-temperature stability. Can be sealed to glass. High transmission in infrared and ultraviolet.

Forms: Rods, spheres, disks, whiskers, single crystals. Uses: Electron and microwave tubes; optical elements in radiation detectors; substrate for thin-film components and integrated circuits; abrasive; record needles; precision instrument bearings; aluminum composites; micromortars for hand-pulverizing chemicals.

"SAR."¹⁸² Trademark applied to ion-exchange resin used in water treating and chemical process applications; Type II, strongly basic anion exchange resin, produced from styrene and divinylbenzene.

"Sarayoy."²³³ Trademark for a line of flexible thermoplastic flashing material based on a saran copolymer.

saran. See polyvinylidene chloride; saran fiber.

saran fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 80% by weight of vinylidene chloride units ($-\text{CH}_2\text{CCl}_2-$) (Federal Trade Commission).

Properties: Tenacity, 2 to 2.5 grams per denier; elongation 15–30%; moisture regain, none; sp. gr. 1.65–1.75; softens at 240 – 280°F ; combustible, but self-extinguishing. Highly resistant to most chemicals and solvents, to weather, moths and mildew.

Uses: Screens; upholstery, curtain and drapery fabrics; rugs and carpets; awnings; filter cloth.

See also polyvinylidene chloride.

sarcosylsin. See melphalan.

sarcosine (methyl glycocoll, methyl aminoacetic acid) $\text{CH}_3\text{NHCH}_2\text{COOH}$.

Properties: Deliquescent crystals with sweet taste; m.p. 210 – 215°C (dec). Very soluble in water; slightly soluble in alcohol. Combustible; low toxicity.

Derivation: Decomposition of creatine or caffeine.

Containers: Drums; tank cars.

Grade: Technical.

Use: Synthesis of foaming antienzyme compounds for toothpastes, cosmetics, and pharmaceuticals.

sardine oil. See fish oil.

sarin (methylphosphonofluoride acid, isopropyl ester) $[(\text{CH}_3)_2\text{CHO}](\text{CH}_3)\text{FPO}$. A nerve gas (q.v.).

Hazard: Highly toxic by inhalation and skin absorption. Cholinesterase inhibitor. Not manufactured.

"Sarkosyl."²¹⁹ Trademark for a series of surface-active N-acylated sarcosines.

Uses: Tooth pastes, cosmetics, and pharmaceuticals (anti-enzyme); corrosion inhibitors; lubricants and greases; inks.

See also sarcosine.

"Sarolex."²¹⁹ Trademark for nematocide and insecticide containing diazinon.

Hazard: May be toxic.

SAS. (1) Abbreviation for sodium aluminum sulfate. See aluminum sodium sulfate. (2) Abbreviation for sodium alkane sulfonate.

satin spar. See calcite.

satin white. A high-bulking filler used in paper coating formulations; a mixture of hydrated lime, potash alum, and aluminum sulfate. Readily hydrated. Particle size range. 0.2 to 2 microns.

saturation. (1) The state in which all available valence bonds of an atom (esp. carbon) are attached to other atoms. The straight-chain paraffins are typical saturated compounds. See also unsaturation. (2) The state of a solution when it holds the maximum equilibrium quantity of dissolved matter at a given temperature. See also solution, true; supersaturation.

"Savalux."²⁸ Trademark for a group of textile dyes selected to give outstanding fastness.

savory oil (summer savory oil)

Properties: Light yellow to dark brown essential oil; aromatic odor; sp. gr. 0.875–0.954 (25°C); refractive index 1.4860–1.5050 (20°C); optical rotation -5° to $+4^\circ$. Soluble in most fixed oils and mineral oil, practically insoluble in glycerin. One ml dissolves in 2 ml 80% alcohol. Combustible; nontoxic.

Derivation: Steam distillation of the whole dried plant *Satureia hortensis* L., an aromatic mint of the United States and Europe.

Grade: F.C.C.

Use: Flavoring agent.

"Saxin."³⁰¹ Trademark for a noncaloric sweetening agent containing saccharin (q.v.).

saxitoxin $\text{C}_{10}\text{H}_{17}\text{N}_7\text{O}_4 \cdot 2\text{HCl}$. A toxic principle present in certain species of shellfish. It is a paralytic poison that attacks the central nervous system.

Saybolt Universal viscosity. The efflux time in seconds (SUS) of 60 ml of sample flowing through a calibrated Universal orifice in a Saybolt viscometer under specified conditions. See also viscosity.

Sb Symbol for antimony (from Latin stibium).

SBA. Abbreviation for sec-butyl alcohol (q.v.).

S.B.G. Abbreviation for standard battery grade; highly purified chemicals manufactured for use in the battery industry.

SBR. Abbreviation for styrene-butadiene rubber (q.v.).

"SBR."¹⁸² Trademark applied to ion-exchange resins used in water treating and chemical process applications; Type I, strongly basic anion exchange resin, produced from styrene and divinylbenzene.

Sc Symbol for scandium.

"SC."⁵⁵⁵ Trademark for triethylene glycol dicaprylate-caprate; used as a plasticizer.

scale. (1) A calcareous deposit in water tubes or steam boilers resulting from deposition of mineral

compounds present in the water, e.g., calcium carbonate. See boiler scale. (2) A type of paraffin or petroleum wax from which all but a few per cent of oil has been removed by hydraulic pressing and subsequent processing. (3) A graduated standard of measurement in which the units (degrees) are defined in relation to some property of what is measured, e.g., temperature scale; Brix scale; Baumé scale.

scale-up. A term used in chemical engineering to describe the calculations and planning involved in carrying a chemical processing operation from the pilot plant to large-scale production stage.

scandium Sc. Metallic element of atomic number 21; Group IIIB of the Periodic Table; atomic weight 44.9559; valence 3; no stable isotopes.

Properties: Silvery white solid; m.p. 1539°C; b.p. 2727°C; density 2.99 g/cc. Does not tarnish in air; reacts rapidly with acids; strongly electropositive. Not attacked by 1:1 mixture of nitric and 48% hydrofluoric acids. It is chemically similar to the rare earths.

Source: Chief ores are wolframite and thortveitite (Norway, Madagascar).

Derivation: Reduction of scandium fluoride with calcium, or with zinc or magnesium alloy. Purification by distillation gives purity of 99+%.

Uses: No major industrial uses. An artificial radioactive isotope has been used in tracer studies and leak detection, and there is some application in the semiconductor field.

scandium fluoride. ScF_3 .

Derivation: Reaction of scandium oxide with ammonium hydrogen fluoride.

Uses: Preparation of scandium metal.

scandium oxide. Sc_2O_3 .

Properties: White amorphous powder. Soluble in hot acids, less so in cold acids. Sp. gr. 3.864; specific heat 0.153. A weak base.

Source: Thortveitite.

Use: Preparation of scandium fluoride.

scavenger (getter). (1) In chemistry, any substance added to a system or mixture to consume or inactivate traces of impurities. (2) In metallurgy, an active metal added to a molten metal or alloy which combines with oxygen or nitrogen in the melt and causes its removal into the slag. Alloys including such metals as thorium, zirconium, and cerium, as well as carbon and misch metal, are used in vacuum tubes to absorb traces of residual gases.

"Scav-Ox."⁸⁴ Trademark for a hydrazine oxygen scavenger. Used to prevent corrosion in boilers and oil wheel casings.

Schaeffer's acid. See 2-naphthol-6-sulfonic acid.

Schaeffer's salt $\text{C}_{10}\text{H}_6\text{OHSO}_3\text{Na}$. Sodium salt of 2-naphthol-6-sulfonic acid (q.v.).

Uses: Intermediate for organic chemicals.

Schaffer's salt. See Schaeffer's salt.

Scheele, C. W. (1742-1786). One of the outstanding early chemical thinkers and experimenters, Scheele was a Swedish scientist who discovered a number of previously unknown substances, among which were tartaric acid, chlorine, manganese salts, arsine and copper arsenite (Scheele's green). He also noted the oxidation states of various metals; observed the nature of oxygen two years before Priestley's discovery; and discovered the chemical action of light on

silver compounds, thus laying the foundation of photochemistry and photography. Scheelite, or natural calcium tungstate, is named after him.

Scheele's green. See copper arsenite.

scheelite CaWO_4 . A natural calcium tungstate, found in igneous rocks, usually with granite. Some molybdenum may replace tungsten.

Uses: Ore of tungsten; phosphor.

Schiff base. A class of compounds derived by chemical reaction (condensation) of aldehydes or ketones with primary amines. The general formula is $\text{RR}'\text{C}=\text{NR}''$.

Properties: Usually colorless crystalline solids, although some are dyes. Very weakly basic and hydrolyzed by water and strong acids to carbonyl compounds and amines.

Uses: Rubber accelerators; dyes (phenylene blue, toluylene blue, and naphthol blue); chemical intermediate; liquid crystals in electronic display systems; perfume base.

Schoelkopf's acid. See 1-naphthylamine-8-sulfonic acid; and 1-naphthol-4,8-disulfonic acid.

schradan. Generic name for actamethyl pyrophosphoramide (OMPA), $[(\text{CH}_3)_2\text{N}]_2\text{P}(\text{O})\text{OP}(\text{O})[\text{N}(\text{CH}_3)_2]_2$.

Properties: Viscous liquid; sp. gr. 1.137; b.p. 120-125°C (0.5 mm); refractive index ($n_{25/D}$) 1.462. Miscible with water; soluble in most organic solvents; hydrolyzed in the presence of acids, but not by alkalis or water alone.

Hazard: Highly toxic by ingestion and inhalation. A cholinesterase inhibitor. Use may be restricted.

Use: A systemic insecticide which is absorbed by the plant, which then becomes toxic to sucking and chewing insects.

Shipping regulations: (Rail, Air) Organic phosphate, liquid, n.o.s. Poison label. Not accepted on passenger planes.

Schweitzer's reagent. A solution of copper hydroxide in strong ammonia used in analytical chemistry as a test for wool. It dissolves cotton, silk and linen.

scintillator. See phosphor.

scission. (1) The rupture of a chemical bond, with production of about 5 electron-volts of energy.

(2) In agricultural technology, the separation of fruit or vegetable products from the tree or vine.

scleroprotein. Any of a large class of proteins that have a supporting or protective function in tendons, bones, cartilages, ligaments and other hard or tough parts of the animal body. They include the collagens of skin, tendons and bones, as well as the elastic proteins known as elastins, and the keratins. Specific examples are the keratin of hair, hoofs and horns and fibroin from silk.

scleroscope hardness. See hardness.

scouring agent. A compound used to remove the natural oils and fats from raw wool; also used to remove lubricants applied to rayon yarns or fabrics during such operations as throwing, winding, weaving, knitting, etc.

"Scriptite."⁵⁸ Trademark for melamine and urea-formaldehyde resins; used in paper industry for wet strength improvement.

scrubbing. Process for removing one or more components from a mixture of gases and vapors by passing it upward and usually countercurrent to and in inti-

mate contact with a stream of descending liquid, the latter being chosen so as to dissolve the desired components and not others. The gas or vapor may be broken into fine bubbles upon entering a tower filled with liquid, but more frequently the tower is filled with coke, broken stone or other packing, over which the liquid flows while exposing a relatively large surface to the rising gas or vapor. See also absorption (1).

"SD-75."⁴³⁰ Trademark for alkenyl dimethyl ethyl ammonium bromide. Used primarily as an algicide in water towers and swimming pools.

SDA. Abbreviation for specially denatured alcohol.

SDA No. 1. Specially denatured alcohol (government regulation formula). It consists of 5 gal methyl alcohol added to 100 gal 95% ethyl alcohol.

Hazard: Highly toxic.

SDDC. Abbreviation for sodium dimethyldithiocarbamate.

Se Symbol for selenium.

Seaboard process. Method of removing hydrogen sulfide from a gas by absorption in sodium carbonate solution. Sodium bicarbonate and sodium hydrosulfide are formed. By blowing air through this solution, hydrogen sulfide is released and carried off, and the sodium carbonate is regenerated.

sealant. Any organic substance that is soft enough to pour or extrude and is capable of subsequent hardening to form a permanent bond with the substrate. Most sealants are synthetic polymers (silicones, urethanes, acrylics, polychloroprene) which are semi-solid before application and later become elastomeric. A few of the best-known sealants are such natural products as linseed oil (putty), asphalt, and various waxes. See also adhesive.

"Sealol."⁵¹ Trademark for "white" mineral oil used as lubricant for sealed refrigeration compressor units.

"Sealstix." Trademark for a cement of the deKhotinsky type (q.v.) which adheres to almost any surface. Insoluble in all common reagents except alcohol, strong caustics and chromic acid cleaning solution.

"Sealvar."²⁹⁹ Trademark for an iron-nickel-cobalt alloy used for making hermetic seals with the harder glasses and ceramic materials.

"Sealz."²⁴⁸ Trademark for a line of thermoplastic rubber compounds which are used as additives for asphalt and tar products to raise softening point, improve low temperature flexibility, enhance adhesive qualities and increase elasticity.

Searles Lake brine. See brine; Trona process.

seasoning. Any food additive used in low concentrations to contribute to the taste of a food. Best-known is sodium chloride, but the term also includes various spices, onion, mustard, etc. See also enhancer; potentiator.

"Sea Sorb."⁵⁵ Trademark for patented grades of magnesia, MgO, with specific adsorption characteristics. Uses: Catalysts, chromatography, purification, decolorization, and dehumidification.

sea water. See ocean water.

seaweed. See algae; phycocolloid; carrageenan; kelp.

sebacic acid (1,8-octanedicarboxylic acid; sebacylic acid; decanedioic acid) $\text{COOH}(\text{CH}_2)_8\text{COOH}$.

Properties: White leaflets; m.p. 133°C; sp. gr. 1.110 (25°C); b.p. 295.0°C (100 mm); refractive index 1.422 (133.3°C); slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: From butadiene via dichlorobutene and its nitrile derivatives; dry distillation of castor oil with alkali.

Containers: Fiber drums; bags.

Grades: C.P.; purified.

Uses: Stabilizer in alkyd resins, maleic and other polyesters, polyurethanes; fibers; paint products; candles and perfumes; low-temperature lubricants and hydraulic fluids; manufacture of nylon 610.

"Sebacol."¹⁷³ Trademark for a tanners' depilatory containing sodium hydrosulfite suitably stabilized for use in alkaline unhairing systems.

sebaconitrile $\text{NC}(\text{CH}_2)_8\text{CN}$.

Properties: Straw-colored oily liquid; b.p. 199°C (15 mm).

Use: Chemical intermediate for drugs, dyes and high polymers.

sebacyl chloride (n-octane-1,8-dicarboxylic acid dichloride) $\text{ClOC}(\text{CH}_2)_8\text{COCl}$.

Properties: Liquid; b.p. 137–140°C (3 mm); 97% pure. Decomposes slowly in cold water; soluble in hydrocarbons and ethers.

Containers: Bottles; carboys; 55-gal drums.

Use: Organic intermediate.

sebacylic acid. See sebacic acid.

sec-. Abbreviation for secondary, as applied to names of organic compounds. See primary. The prefix is ignored in alphabetical arrangement.

"Seconal."¹⁰⁰ Trademark for secobarbital (q.v.).

secondary. See primary.

secondary calcium phosphate. See phosphate, dibasic.

sedanolic acid $\text{C}_{12}\text{H}_{20}\text{O}_3$. A constituent of celery seed oil. Its lactone, also present, which is the source of the characteristic odor, is sedanolide.

sedative. A natural or synthetic therapeutic agent having the property of inducing relaxation and varying degrees of depression of the central nervous system. The major types of sedatives are: (1) chlorine substitution products (chloral hydrate, chlorobutanol); (2) ethyl alcohol derivatives (ethyl carbamate, hedonal); (3) specific aldehydes and ketones (paraldehyde, amylene hydrate); barbituric acid derivatives (barbital, barbiturates, q.v.). Sedatives are almost always prescription drugs. See also tranquilizer.

sedimentation. The settling out by gravity of solid particles suspended in a liquid, the rate of settling being defined by Stoke's Law (q.v.). This method is used industrially in water purification. It is also an analytical procedure for separation of solids of different particle size, as well as for molecular weight determination. The *sedimentation* of large molecules in a strong centrifugal field permits determination of both average molecular weights and the distribution of molecular weights in certain systems. When a solution containing polymer or other large molecules is centrifuged at forces up to 250,000 times gravity, the molecules begin to settle, leaving pure solvent above a boundary which progressively moves

toward the bottom of the cell. An optical system is provided for viewing this boundary, and a study as a function of the time of centrifuging yields the rate of sedimentation for the single component, or for each of many components of a polydisperse system. These sedimentation rates may then be related to the corresponding molecular weights of the species present after the diffusion coefficients for each species are determined by independent experiments. The result of this work is the distribution of molecular weights in the sample which is attainable by few other methods.

See also precipitate.

seed. (1) That part of a plant which includes the plant embryo itself, a quantity of stored food (fats, carbohydrates, and proteins in varying proportions), and the enclosing cellulosic coats. The food storage tissue is called the endosperm. Starch is an important food reserve in the endosperms of cereals and legumes; sugar in sweet corn; protein in soybean and wheat; and fats in such plants as coconut, cacao, castor bean, and most types of palms. Such growth substances as gibberellin also occur in seeds; some also contain alkaloids (ricinine, hyoscyne, and caffeine). The seeds or bulbs of some plants are highly toxic, e.g., hyacinth, larkspur, castor bean, cashew nut shells. Bitter almond contains as much as 10% of hydrocyanic acid, which is removed in processing. Seeds (which in many cases are equivalent to nuts) are an important source of vegetable oils, which are used as food components, in paints and other industrial products, and in medicine.

(2) Trace proportions of a material introduced to initiate a desired reaction, where the "seed" acts as a nucleating agent. An example is the seeding of a cloud with silver iodide to cause precipitation by providing means for the nucleation of droplets. See nucleation.

Seger cone. See pyrometric cone.

Seidlitz powder. A two-part dosage, to be dissolved in water and drunk while effervescing.

In the blue paper: 3 parts Rochelle salt with 1 part sodium bicarbonate.

In the white paper: Tartaric acid.

Grade: N.F.

Containers: Fiber drums.

Use: Medicine (antacid).

"Seismex."²⁸ Trademark for an ammonia dynamite with limited water resistance (for seismic prospecting).

Hazard: Dangerous fire risk; moderate explosion risk.

"Seismogel."²⁸ Trademark for a straight gelatin dynamite when water conditions are only moderately severe; for seismic prospecting.

Hazard: Dangerous fire risk; moderate explosion risk.

"Selectacel."²³¹ Trademark for ion-exchange cellulose products which are derived from purified wood pulp by chemical reaction and substitution. White fibrous powders packed in glass, plastic and fiber drums. Used for the isolation and purification of proteins.

selenic acid H_2SeO_4 .

Properties: White hygroscopic solid; sp. gr. 3.004 (15/4°C); m.p. 58°C (easily undercools); decomposes at 260°C. Very soluble in water; decomposes in alcohol; usually available as a liquid, sp. gr. 2.609 (15°C).

Hazard: Highly toxic; strong irritant to skin and mucous membranes.

Shipping regulations: (Air) Liquid; Corrosive label. Not acceptable on passenger planes. Solid: Poison label.

selenious acid. See selenous acid.

selenium Se A nonmetal (q.v.). Atomic number 34; Group VIA of the Periodic Table. Atomic weight 78.96; valences 2, 4, 6. There are 6 stable isotopes.

Properties: Amorphous red powder, becoming black on standing and crystalline on heating; vitreous and colloidal forms may be prepared. Crystalline form has sp. gr. about 4.5; m.p. 217°C; b.p. 685°C. Amorphous form softens at 40°C and melts at 217°C. Crystalline selenium is a p-type semiconductor. Electrically it acts as a rectifier, and has marked photoconductive and photovoltaic action (converts radiant to electrical energy). The electrical conductivity increases with increasing light irradiation. Soluble in concentrated nitric acid and (in liquid form) in common alkalis. Forms binary alloys with silver, copper, zinc, lead, etc. Low toxicity.

Occurrence: Copper ores; soils; feed crops such as corn and soybeans. Se is a necessary nutritional factor in animals.

Grades: Commercial (powder or lumps); high-purity up to 99.999%.

Containers: Glass bottles; drums.

Uses: Electronics (xerographic plates, TV cameras, photocells, magnetic computer cores, solar batteries, rectifiers, relays; ceramics (colorant for glass); steel and copper (degasser and machinability improver); rubber accelerator; catalyst; trace element in animal feeds.

For further information consult Selenium, Tellurium Development Ass'n. 11 Broadway, New York, N.Y.

selenium diethyldithiocarbamate $\text{Se}[\text{SC}(\text{S})\text{N}(\text{C}_2\text{H}_5)_2]_4$.

Properties: Orange-yellow powder; sp. gr. (20/20°C) 1.32; melting range 63–71°C; characteristic odor. Soluble in carbon disulfide, benzene, chloroform; insoluble in water.

Containers: 5-, 50-, 100-lb drums.

Hazard: Toxic by inhalation; moderately toxic by ingestion and skin absorption. Tolerance (as Se), 0.2 mg per cubic meter of air.

Use: Vulcanization agent without added sulfur or as a primary or secondary accelerator with sulfur.

selenium dimethyldithiocarbamate. See "Methyl Selenac."

selenium dioxide (selenous acid anhydride) SeO_2 .

Properties: White or yellowish white to slightly reddish, lustrous, crystalline powder or needles; sp. gr. 3.954 (15/15°C); m.p. 340–350°C (sublimes); soluble in alcohol, water.

Hazard: Toxic by inhalation; moderately toxic by ingestion and skin absorption. Tolerance (as Se), 0.2 mg per cubic meter of air.

Uses: Analysis (testing for alkaloids); medicine; oxidizing agent; antioxidant in lubricating oils; catalyst.

selenium sulfide (selenium disulfide) SeS_2 .

Properties: Bright orange powder; faint odor at most; m.p. < 100°C. Practically insoluble in water and organic solvents.

Grade: U.S.P.

Hazard: Toxic by ingestion; strong irritant to eyes and skin. Tolerance, 0.2 mg per cubic meter of air.

Uses: Medicine (treatment of seborrhea; medicated shampoos).

selenous acid (selenious acid) H_2SeO_3 .

Properties: Transparent, colorless deliquescent crys-

tals; soluble in water and alcohol; insoluble in ammonia. Sp. gr. 3.0066; m.p. 70°C, decomposes.

Derivation: Action of hot nitric acid on selenium.

Hazard: Toxic by inhalation; moderately toxic by ingestion and skin absorption. Tolerance (as Se), 0.2 mg per cubic meter of air.

Use: Chemical reagent.

selenous acid anhydride. See selenium dioxide.

"Sellogen."³⁰⁹ Trademark for a series of detergent, emulsifying, and wetting agents used in the textile industry and in the manufacture of cosmetics.

semecarpus nut (acajou nut). The fruit of *semecarpus anacardium*; oriental cashew nut. Properties and uses similar to cashew nut. See cashew nutshell oil.

"Semesan."²⁸ Trademark for a wettable powder containing 25.3% hydroxymercurichlorophenol.

Hazard: See mercury compounds.

"Semesan Bel."²⁸ Trademark for a seed disinfectant containing 12.5% hydroxymercurinitrophenol and 3.8% hydroxymercurichlorophenol.

Hazard: See mercury compounds.

semicarbazide hydrochloride (carbamyldiazine hydrochloride; aminourea hydrochloride)

$\text{H}_2\text{NCONHNH}_2 \cdot \text{HCl}$.

Properties: Snow-white crystals; m.p. 172–175°C (dec); soluble in water; insoluble in absolute alcohol and ether; soluble in dilute alcohol.

Derivation: From hydrazine sulfate, potassium or sodium cyanate and sodium carbonate, or electrolytically by the reduction of nitrourea.

Grades: C.P.; technical.

Containers: Bottles; fiber drums.

Uses: Reagent for aldehydes and ketones; isolation of hormones and isolation of certain fractions from essential oils.

semiconductor. An element or compound having an electrical conductivity intermediate between that of conductors and non-conductors (insulators). Most metals have quite high conductivity, while substances like diamond and mica have very low conductivity (high resistance). Between these extremes lie the semiconductors, of which germanium, silicon, silicon carbide, and selenium are examples, with resistivities in the range of 10^{-2} to 10^9 ohms/cm. Slight traces of impurities in the crystalline structure are essential for semiconductor; arsenic is a typical impurity in semiconductor crystals. These impurities function as electron donors or acceptors, and the semiconductor is designated n-type or p-type, depending on the electrical nature of the "holes," or energy deficits in the crystal lattice.

The functioning of semiconductors involves the science of solid state physics. Their discovery in the early 1940's made possible the development of transistors, with their manifold applications in electronic devices, in which they have largely replaced the vacuum tube.

There are a few organic semiconducting compounds which contain a significant amount of carbon-carbon bonding, and are also capable of supporting electronic conduction. Anthracene and Ziegler-catalyzed acetylene polymers (conjugated polyolefins) are examples. See also crystal; impurity; solid; solid state chemistry.

semimicrochemistry. Any chemical method (usually analytical) in which the weight of the sample used is from 10 to 100 mg.

semipermeable membrane. See membrane, semipermeable.

semisynthetic. A product involving a chemical reaction which is based on or derived from a natural material, but does not occur as such in nature. Examples are paper, soap, cement, glass, and the chemical modifications of cellulose (rayon, nitrocellulose, methylcellulose, cellulose acetate); similarly for the modified starches. See also synthesis.

"Sentry."²¹⁴ Trademark for sorbic acid and potassium sorbate (q.v.). Used in fungistats for the control of certain molds and yeasts in foods. Also trademark for propylene glycol, U.S.P. Used as solvent for flavors and colors; humectant for baked goods; and plasticizer for cork seals and crowns.

"Separan."²³³ Trademark for a series of flocculating agents.

AP30. Synthetic high molecular weight anionic polymer.

C-90 and C-120. Synthetic, high-molecular-weight cationic polymers.

MGL. Similar to NP10. Used in production of uranium.

NP10. Synthetic, water-soluble nonionic, high-molecular-weight polymer of acrylamide. "Separan" NP10 potable water grade flocculant has been accepted, subject to maximum use concentration of one ppm by the U.S. Public Health Service.

NP20. Nonionic polyacrylamide polymer.

PG2. Similar to NP10. Used in paper mfg.

separation. A collective term including a number of unit operations which, in one way or another, isolate the various components of mixtures. Chief among these are evaporation, distillation, drying, gas absorption, sedimentation, solvent extraction, pressure extraction, adsorption, and filtration. Specialized methods include centrifugation, magnetic separation (mass spectrograph), gaseous diffusion, and various types of chromatography. For further information see specific entry.

"Sephadex."⁴⁸⁵ Trademark for a dry, insoluble powder composed of macroscopic beads which are synthetic, organic compounds derived from the polysaccharide dextran. The dextran chains are cross-linked to give a three dimensional network and the functional ionic groups are attached to the glucose units of the polysaccharide chains by ether linkages. Available in various forms for use in many different phases of chromatography.

septiphen. See ortho-benzyl-para-chlorophenol.

"Septo-Sour."²⁴⁴ Trademark for a product consisting chiefly of zinc salts of fluorine compounds.

Properties: White, dustless crystals; readily soluble in water; neutralizing value 25.6 oz sodium bicarbonate per lb.

Containers: 10-lb net corrugated paper drums; 60-lb net plywood drums; 150- and 300-lb net fiber drums.

Uses: Laundry sour, especially low temperatures.

sequestration. The formation of a coordination complex by certain phosphates with metallic ions in solution so that the usual precipitation reactions of the latter are prevented. Thus, calcium soap precipi-

tates are not produced from hard water treated with certain polyphosphates and metaphosphates. (These polyphosphates are often improperly referred to as hexametaphosphates). The term sequestration may be used for any instance in which an ion is prevented from exhibiting its usual properties due to close combination with an added material. Two groups of organic sequestering agents (chelates in these examples) of economic importance are the aminopolycarboxylic acids such as ethylenediaminetetraacetic acid and the hydroxycarboxylic acids such as gluconic, citric, and tartaric acids. In the food industry sequestering agents aid in stabilizing color, flavor, and texture.

See also chelate; coordination compound; complex.

"Sequestrene."²¹⁹ Trademark for a series of complexing agents and metal complexes consisting of ethylenediaminetetraacetic acid and salts.

Ser Abbreviation for serine.

serendipity. An unexpected scientific discovery which turns out to be more important than the project being researched. One example is the discovery of the sodium sulfide polymer, later known as "Thiokol," while the researcher was seeking to develop an improved automotive coolant. Another is the discovery of the reinforcing effect of carbon black on rubber while technologists were using it as a black pigment to counteract the whitening effect of zinc oxide.

serine (beta-hydroxyalanine; alpha-amino-beta-hydroxypropionic acid. $\text{HOCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A non-essential amino acid occurring naturally in the L(-) form.

Properties: Colorless crystals; soluble in water; insoluble in alcohol and ether; optically active; DL-serine, m.p. 246°C with decomposition; D(+)-serine, m.p. 228°C with decomposition; L(-) serine, m.p. 228°C with decomposition. Available commercially in all three forms.

Derivation: Hydrolysis of protein (especially silk protein); synthesized from glycine.

Uses: Biochemical research; dietary supplement; culture media; microbiological tests; feed additive.

"Serizyme."¹⁷³ Trademark for a proteolytic enzyme preparation for desizing textiles.

serotonin (5-hydroxytryptamine; 5-hydroxy-3-(beta-aminoethyl)indole) $\text{C}_{10}\text{H}_{12}\text{N}_2\text{O}$. A powerful vasoconstrictor occurring in the brain and blood platelets; it is thought to play a part in regulation of blood pressure, and also has muscle-contracting properties. It has been isolated from beef serum and may be synthesized from 5-benzoyloxyindole. Serotonin is similar to the hallucinogenic drugs mescaline, LSD, psilocin and psilocybin. Its formation is inhibited by p-chlorophenylalanine.

"Serpasil."³⁰⁵ Trademark for reserpine (q.v.).

serum. (1) The continuous phase of a biocolloid after the solid or disperse phase has been removed by centrifugation, coagulation or similar means. In the case of milk, for example, the serum, or whey, is a true solution of sugars, proteins, and mineral compounds in water. (2) Specifically, blood from which corpuscles, platelets, etc. have been removed, especially when prepared with antigenic bacteria for inoculation to effect the cure of a disease.

SES. Abbreviation for sodium 2,4-dichlorophenoxyethyl sulfate. See sesone.

sesame oil (benne oil; teel oil)

Properties: A fixed, bland, yellow, almost odorless liquid. Does not readily become rancid; sp. gr. 0.9187 ($25/25^\circ\text{C}$); solidifying point -5°C ; m.p. $20-25^\circ\text{C}$ (for free fatty acids); Helmer value 95.7; saponification value 188-193; iodine value 103-114; refractive index 1.4748-1.4762. Optically active. Soluble in chloroform, carbon disulfide, ether, and benzene; slightly soluble in alcohol. Combustible; nontoxic.

Chief known constituents: Olein (75%); stearin; palmitin; myristin; linolein, sesamin, and sesamol.

Derivation: By pressing from *Sesamum indicum* (orientale).

Occurrence: China; Japan; East Indies; South America.

Grades: Edible, should contain less than 1% free fatty acids; semirefined; coast; U.S.P.

Containers: Drums.

Uses: Shortenings, salad oil, margarine and similar food products.

sesamex. Generic name for 2-(2-ethoxyethoxy)ethyl 3,4-(methylenedioxy)phenyl acetal of acetaldehyde. $\text{CH}_2\text{O}_2\text{C}_6\text{H}_3\text{OCH}(\text{CH}_3)\text{OC}_2\text{H}_4\text{OC}_2\text{H}_4\text{OC}_2\text{H}_5$.

Properties: Liquid; b.p. $137-141^\circ\text{C}$ (0.08 mm). Soluble in non-polar solvents.

Hazard: May be toxic.

Use: Synergist for insecticides.

sesamin. Generic name for 2,6-bis[3,4-(methylenedioxy)phenyl]-3,7-dioxabicyclo[3.3.0]octane, $\text{C}_{20}\text{H}_{18}\text{O}_6$.

Properties: Solid; m.p. 122.5°C . Combustible.

Hazard: May be toxic.

Use: Synergist for insecticides and fungicides.

sesamol. Generic name for 6-[3,4-(methylenedioxy)phenoxy]-2-[3,4-(methylenedioxy)phenyl]3, 7-dioxabicyclo[3.3.0]octane, $\text{C}_{22}\text{H}_{18}\text{O}_7$. Constituent of sesame oil which is a powerful synergist of pyrethrum. A 1:1 mixture of pyrethrum and sesamoline has 31 times the insecticidal activity of pyrethrum alone.

sesone. Generic name for sodium 2,4-dichlorophenoxy-ethyl sulfate (SES) $\text{C}_6\text{H}_3\text{Cl}_2\text{OCH}_2\text{CH}_2\text{SO}_3\text{Na}$.

Properties: Crystalline solid; m.p. 245°C ; soluble in water.

Hazard: May be toxic.

Use: Pre-emergence herbicide.

sesqui. A prefix meaning one and a half. Often used for salts in which the proportions of metal oxide to acid anhydride are 2:3, or vice-versa, as in sodium sesquicarbonate.

sesquiterpene. A terpene having the formula $\text{C}_{15}\text{H}_{24}$, one and a half times the standard terpene formula of $\text{C}_{10}\text{H}_{16}$. An example is cadinene, a constituent of various wood oils (cade oil, cedarleaf oil, etc.).

"Setit."³³⁷ Trademark for suspension aid used in the ceramic industry. Composed of a colloidal form of aluminum oxide.

"Setole."⁴² Trademark for thermoplastic resin emulsions; used as finishing agents for all types of textile fabrics.

"Setrete."⁴⁸ Trademark for a seed disinfectant containing phenyl mercuric ammonium acetate. Used for cereal grains and cotton seed.
Hazard: See mercury compounds.

"Setsit."⁶⁹ Trademark for a series of activated dithiocarbamate liquid accelerators for natural and synthetic latex films and adhesives.

"Sevin."²¹⁴ Trademark for a carbaryl insecticide (1-naphthyl N-methyl carbamate).

"Sevron."²⁸ Trademark for a series of cationic dyes.

sewage sludge. A mixture of organic materials resulting from purification of municipal waste. There are two types:

(a) Imhoff sludge: A low grade sludge containing from 2 to 3% ammonia and about 1% phosphoric acid.

(b) Activated sludge: A high-grade sludge containing from 5.0 to 7.5% ammonia and from 2.5 to 4.0% phosphoric acid.

Derivation: (a) By running sewage through settling tanks without access of air. The sludge, or solid matter, is decomposed by anaerobic bacteria.

(b) By running sewage through settling tanks and pumping air (or oxygen) through porous plates at the bottom of the tanks. 20% of the current "make" is also added. The waste acts as nutrient for aerobic bacteria, which consume the polluting organic matter. The resulting solids are filtered and dried.

Use: Fertilizer.

See also milorganite.

"SF-100."²³⁶ Trademark for a granular organic material used as the basic additive for preparing low filtrate casing packs, and for spotting fluid to free differentially stuck pipe. It can be prepared with density of 7.6 lb/gal for use where formation is too weak to support a full column of mud or heavier packs.

"S-Fatty Acids."⁴⁸⁷ Trademark for fatty acids derived from soybean oil. S-210 is a soy fatty acid developed primarily for alkyd resins. S-230 is a soy-type fatty acid having a lower unsaturated acids content and higher titer than S-210.

Properties: S-210 is a light yellow liquid and S-230 a light yellow semi-solid at ambient temperature.

Containers: Tank cars and trucks.

Uses: Chemical intermediate, paints and varnishes, alkyd resins and soaps.

SFS. (1) Abbreviation for Saybolt Furol seconds. See Furol viscosity and Saybolt Universal viscosity.

(2) Abbreviation for sodium formaldehyde sulfoxylate.

"SGL" Activated Carbon.³²¹ Trademark for a decolorizing carbon also designed for use in fixed beds. Total surface area (N₂, BET Method) 950-1050 sq m/g; particle size 8 × 30 mesh; apparent density 30 lb/cu ft.

SGR. Abbreviation for steam gas recycle process for shale oil recovery. See also shale oil.

"Sale Ban."²³⁶ Trademark for buffered lignosulfonate. Used to convert or maintain muds for drilling mud-making shales or for drilling and completing "dirty sand" formations.

shale oil. A crude oil obtained from oil shale (q.v.) by destructive distillation followed by hydrotreating. Extensive deposits of the shale are located in Colorado, Wyoming, and Utah. Its content or bitumen (kerogen) is reported to have the composition 75% carbon, 10% hydrogen, 2.5% nitrogen, 1.5% sulfur and 9% oxygen. After refining it yields about 18% gasoline, 30% kerosene, 25% gas oil, 15% light lube oil, and 10% heavy lube oil. Its chemical structure is aliphatic, the refining residues consisting of paraffin wax. Extraction may be effected by any of several retorting processes.

Note: The contribution of shale oil to energy requirements is likely to be slight in the short-range future,

largely because of the low concentration of oil in the shale, which necessitates earth-moving operations on a tremendous scale for which satisfactory equipment is not available. There are also undesirable ecologic effects, as well as the high cost of extraction installations. A large scale extraction has been considered by a group of companies in Colorado in the Federal Naval Reserve area, based on scale-up of successful pilot-plant operation. Though production is technically feasible, the capital requirements are so great that significant production appears to be uneconomic for the indefinite future.

shape-selective catalyst. A catalytic solid (transition metal) introduced into a crystalline aluminosilicate (zeolite) having ports or openings of about 5 angstrom units. This permits the catalyst to exert a selective effect between molecules that differ in shape, rather than in the reactivity of their chemical groups. The cage structure of the zeolite effectively prevents contact of the catalyst with all molecules whose shape and size exclude their entry. The ability of a catalyst to discriminate among molecules on the basis of their shape is of great value in the cracking of straight-chain hydrocarbons, and has attractive possibilities in other types of catalytic reactions.

shark liver oil

Properties: Yellow to red-brown liquid; strong odor; sp. gr. 0.917-0.928. Soluble in ether, chloroform, benzene, and carbon disulfide.

Derivation: By expression from shark livers.

Method of purification: Chilling and filtration.

Grades: Crude; refined.

Uses: Source of vitamin A and of squalene; biochemical research.

"Sharstop."²⁰⁴ Trademark for a series of short-stopping agents used in the polymerization of synthetic rubbers.

shell. (1) In physical chemistry, this term is applied to any of the several paths or orbits of the electrons in an atom as they revolve around its nucleus. They constitute a number of principal quantum paths representing successively higher energy levels. There may be from 1 to 7 shells, depending on the atomic number of the element and corresponding to the 7 periods of the Periodic Table. The shells are usually designated by number, though letter symbols have been used, i.e., K ... Q. The laws of physics limit the number of electrons in the various shells as follows: 2 in the first (K), 8 in the second (L), 18 in the third (M), and 32 in the fourth (N). With the exception of hydrogen and helium, each shell contains two or more orbitals, each of which is capable of holding a maximum of 2 electrons. See also quantum number; orbital theory; Pauli exclusion principle.

(2) The hard integument of molluscs and crustaceans, consisting mostly of calcium carbonate, chitin, etc. See naire; oyster shells.

(3) The brittle covering of avian eggs, chiefly calcium carbonate, lime, etc. The formation of proper shell structures in certain species of birds is said to be adversely affected by DDT and similar insecticidal contaminants of their food.

(4) The shells of nuts are cellulosic in character; some contain industrially useful oils.

"Shell A-A Weed Seed Killer."¹²⁵ Trademark for a preplant herbicide containing not less than 98 wt % allyl alcohol.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption.

shellac (lac; garnet lac; gum lac; stick lac).

Derivation: A natural resin secreted by the insect *Laccifer lacca* (*coccus lacca*) and deposited on the twigs of trees in India. After collection, washing, and purification by melting and filtering it is formed into thin sheets, which are later fragmented into flakes of Orange Shellac; this may be dewaxed and bleached to a transparent product. Soluble in alcohol; insoluble in water.

Grades: (1) Orange: TN(impure), fine, superfine, heart, superior; (2) Bleached and dewaxed (colorless).

Containers: Glass bottles; terne-plated cans; bags.

Hazard: (alcohol solution) Flammable, dangerous fire risk.

Uses: Sealer coat under varnish; finish coat for floors, furniture, etc.; dielectric coatings; deKhotinsky cement (q.v.).

"Shellacol."³¹⁹ Trademark for an alcohol-type solvent; available both anhydrous and made from 190 proof alcohol. Mild odor, free from objectionable characteristics. May be purchased without a Federal permit.

Hazard: Flammable liquid.

Uses: Shellac solvent and thinner; nitrocellulose lacquers and other protective coatings; cleaning and drying metal parts; printing industry; glass cleaners; antifreeze; lamp and stove fuel; chemical and chemical specialties.

"Shellflex."¹²⁵ Trademark for a series of petroleum products largely composed of naphthenic and/or paraffinic hydrocarbons.

Properties: Colors ranging from near water-white to black; viscosities from 3 cp to 55 cp at 210°F; sp. gr. from 0.85 to 0.95; odor slight to none; very low volatilities.

Hazard: Probably flammable.

Uses: Rubber processing and extending oils; miscellaneous process oil uses.

"Shell" Isoprene Rubber.¹²⁵ Trademark for a synthetic elastomer having properties which approximate those of natural rubber. A stereospecific isoprene polymer which has been reacted to a high structural purity of about 92% cis-1,4-polyisoprene.

"Shell Sol."¹²⁵ Trademark for a series of aliphatic hydrocarbon solvents composed of mixtures of paraffinic, naphthenic and aromatic hydrocarbons.

"Shell"-S-Polymers.¹²⁵ Trademark for a series of general-purpose and specialty butadiene-styrene copolymers, including clear hot and cold copolymers, cold oil-extended copolymers, hot and cold black masterbatches, cold oil-black masterbatches, as well as high styrene resin/cold copolymer masterbatches and hot and cold latexes. Used in a wide variety of applications, including tires, tire repair materials, mechanical goods, etc.

"Shellwax."¹²⁵ Trademark for a series of paraffin waxes derived from distillate lube streams.

sherardizing. The process by which relatively small articles made of iron or steel are coated with zinc powder. The metal forms an alloy with the steel surface and produces a thin, tightly adherent corrosion-resistant coating.

"Sherbelizer."³²² Trademark for an algin derivative-vegetable gum composition.

Uses: Stabilizer for sherbets, water ices, frozen fruits, syrups, purees, chocolate ice cream.

"Sherflex."¹⁴¹ Trademark for a series of plasticizers. "Sherflex DBP," dibutyl phthalate.

shielding. Protection of personnel from the harmful effects of ionizing radiation and/or neutrons by enclosure of the equipment (reactor, particle accelerator, x-ray generator, etc.) with an absorbing material. The most efficient of these are cadmium, lead, steel, and high-density concrete (3 feet of concrete equals about 1 foot of steel). Among the plastics, polyethylene affords reasonable protection in thick sheets. Water and paraffin wax are good neutron absorbers because of their high hydrogen content. Materials such as graphite and beryllium are able to deflect and retard neutrons and are used for this purpose as moderators in nuclear reactors. Heavy water is also used.

shortstopping agent. A material used in a polymerization reaction to cut off the reaction at a predetermined point. Example: use of diethylhydroxyl amine or sodium dimethyldithiocarbamate to control synthetic rubber polymerization; tetraethylsilanol is used in silicone polymers.

Si Symbol for silicon.

side-chain. See chain.

siderite (chalybite; spathic iron ore) FeCO_3 , usually with some calcium, magnesium or manganese. The term siderite is also used for an iron alloy found in meteorites.

Properties: Gray, yellow, brown, green, white or brownish red mineral, vitreous inclining to pearly luster, white streak; sp. gr. 3.83-3.88; Mohs hardness 3.5-4.

Occurrence: United States (Vermont, Massachusetts, Connecticut, New York, North Carolina, Pennsylvania, Ohio); Europe.

Use: An ore of iron; when high in manganese, used in the manufacture of spiegeleisen.

sienna. A yellowish hydrated iron oxide. Raw sienna is a brown-tinted yellow ocher occurring in Alabama, California, Pennsylvania; Cyprus and Italy. Burnt sienna is an orange-brown pigment made by calcining raw sienna. See also ocher; iron oxide reds.

Containers (raw or burnt): Paper bags.

Uses: Colorant in oil paints, stains, pastels, etc.

"Sierrallite."³⁸ Trademark for hydrous magnesium-aluminum silicate derived from the mineral prochlorite. Used in ceramics in the preparation of synthetic cordierite for high resistance to heat shock. Supplied as 200-mesh powder.

siglure. Generic name for sec-butyl 6-methyl-3-cyclohexane-1-carboxylate $\text{CH}_3\text{C}_6\text{H}_8\text{COOCH}(\text{CH}_3)\text{C}_2\text{H}_5$.

Properties: Liquid; b.p. 113-114°C (15 mm). Soluble in most organic solvents; insoluble in water. Combustible.

Use: Insect attractant.

sigma bond. A covalent bond directed along the line joining the centers of two atoms. They are the normal single bonds in organic molecules. See also pi bond.

silane (silicon tetrahydride). SiH_4 .

Properties: A gas with repulsive odor. Solidifies at about -200°C, b.p. -112°C; insoluble in water. Sp. gr. 0.68.

Hazard: Highly toxic; strong irritant to tissue. Dangerous fire risk; ignites spontaneously in air. Tolerance, 0.5 ppm in air.

Use: Doping agent for solid-state devices.

Shipping regulations: (Air) Not acceptable.

"Silaneal."¹⁴⁹ Trademark for organopolysiloxanes used for making materials water-repellent.

silane compounds. Gaseous or liquid compounds of silicon and hydrogen ($\text{Si}_n\text{H}_{2n+2}$), analogous to alkanes or saturated hydrocarbons. SiH_3 is called silyl (analogous to methyl), and Si_2H_5 is disilyl (analogous to ethyl). A cyclic silicon and hydrogen compound having the formula $(\text{SiH}_2)_n$ is called a cyclosilane. Organo-functional silanes are noted for their ability to bond organic polymer systems to inorganic substrates.

Hazard: Highly toxic; dangerous fire risk.

See also silicone; siloxane.

"Silastic."¹⁴⁹ Trademark for compositions in physical character comparable to milled and compounded rubber prior to vulcanization but containing organosilicon polymers. Parts fabricated of "Silastic" are serviceable from -100 to 500°F ; retain good physical and dielectric properties in such service; show excellent resistance to compression set, weathering, and corona. Thermal conductivity is high; water absorption low.

Uses: Diaphragms, gaskets and seals, O-rings, hose, coated fabrics, wire and cable, and insulating components for electrical and electronic parts.

"Silbond."¹ Trademark for ethyl silicate; available as pure, condensed, prehydrolyzed, and specialty formulations.

"Silco-Flex."¹¹⁶ Trademark for a silicone-rubber insulation for use on large motors and generators.

"Silene."¹⁷⁷ Trademark for hydrated calcium silicates for rubber reinforcing and flow conditioning.

"Silflake."³¹ Trademark for a commercially pure silver, containing about 1% of organic lubricant and traces of iron. Particle size, 2 to 10 microns.

Grades: 131, 135 and 850 (variable conductivities and covering power). "Wet" flake contains a flammable solvent.

Uses: Conductive coatings and adhesives.

"Silfrax."²⁸⁰ Trademark for bonded refractories containing from 40% to 78% silicon carbide.

Properties: High refractoriness; great strength; high thermal conductivity; freedom from spalling; resistance to clinker adhesion; and resistance to mechanical and flame abrasion.

Uses: Bricks for boiler and furnace installations; kiln furniture in ceramic kilns; shapes for boiler furnaces, air-cooled furnace linings, glass lehrs, pit furnaces, and enameling furnace ware supports.

"Silgon."¹ Trademark for a group of silicone products.

silica (silicon dioxide) SiO_2 . Occurs widely in nature as sand, quartz, flint, diatomite.

Properties: Colorless crystals or white powder; odorless and tasteless; sp. gr. 2.2–2.6; insoluble in water and acids except hydrofluoric; soluble in molten alkali when finely divided and amorphous. Combines chemically with most metallic oxides. Noncombustible; melts to a glass with lowest known coefficient of expansion (fused silica). Thermal con-

ductivity about half that of glass. M.p. 1710°C ; b.p. 2230°C . High dielectric constant; high heat and shock resistance.

Derivation: Can be made from a soluble silicate (water glass) by acidification, washing, and ignition. Arc silica is made from sand, vaporized in a 3000°C electric arc.

Grades: By purity and mesh size; silica aerogel; hydrated; precipitated.

Containers: Multiwall paper bags.

Hazard: Toxic by inhalation; chronic exposure to dust may cause silicosis.

Uses (powder): Manufacture of glass, water glass, ceramics; abrasives; water filtration; component of hydraulic cements; source of ferrosilicon and elemental silicon; filler in cosmetics, pharmaceuticals, paper, insecticides; hydrated and precipitated grades as rubber reinforcing agent, including silicone rubber; anticaking agent in foods; flattening agent in paints; thermal insulator. (Fused): Ablative material in rocket engines, spacecraft, etc.; fibers in reinforced plastics; special camera lenses.

See also quartz; silicic acid; silica gel.

silica, fumed. A colloidal form of silica made by combustion of silicon tetrachloride in hydrogen-oxygen furnaces. Fine white powder.

Uses: Thickener, thixotropic, and reinforcing agent in inks, resins, rubber, paints, cosmetics, etc.

See also "Aerosil."

silica, fused. See silica.

silica gel. A regenerative adsorbent consisting of amorphous silica. Nontoxic; noncombustible.

Derivation: From sodium silicate and sulfuric acid.

Grades: Commercial grades capable of withstanding temperatures up to 500 – 600°F are supplied in the following mesh sizes: 3–8, 6–16, 14–20, 14–42, 28–200 and through 325.

Containers: Air-tight metal containers.

Uses: Dehumidifying and dehydrating agent; air-conditioning; drying of compressed air and other gases, liquids, such as refrigerants, and oils containing water in suspension; recovery of natural gasoline from natural gas; bleaching of petroleum oils; catalyst and catalyst carrier; chromatography; anticaking agent in cosmetics and pharmaceuticals; in waxes to prevent slipping.

See also silicic acid.

"SilicAR."³²⁹ Trademark for silica-gel-based formulations, suitable for various chromatographic applications. The numerical suffixes indicate the approximate pH of a 10% slurry. Letters F, G, or GF indicate that the product contains a fluorescent material, gypsum binder or both. TLC indicates suitability for thin layer chromatography.

silicate. Any of the widely occurring compounds containing silicon, oxygen, and one or more metals, with or without hydrogen. The silicon and oxygen may combine with organic groups to form silicate esters. Most rocks (except limestone and dolomite) and many mineral compounds are silicates. Typical natural silicates are gemstones (except diamond), beryl, asbestos, talc, clays, feldspar, mica, etc. Portland cement contains a high percentage of calcium silicates. Best known of the synthetic (soluble) silicates is sodium silicate (water glass) (q.v.).

Hazard (natural silicate dusts): Toxic by inhalation. Tolerances range from 5 to 50 million particles per cubic foot of air. They are also fire risks.

Uses: Fillers in plastics and rubber; paper coatings; antacids; anticaking agents; cements.

silicic acid (hydrated silica). $\text{SiO}_2 \cdot n\text{H}_2\text{O}$. The jelly-like precipitate obtained when sodium silicate solution is acidified. The proportion of water varies with the conditions of preparation and decreases gradually during drying and ignition, until relatively pure silica remains. During drying the jelly is converted to a white amorphous powder or lumps. Used as laboratory reagent and reinforcing agent in rubber. See silica gel.

"Siliclad,"²³⁹ Trademark for a water-soluble silicone concentrate, used for coating or treating laboratory glassware, ceramics, metal, rubber and plastic product.

silicochloroform. See trichlorosilane.

silicomanganese. Alloys consisting principally of manganese, silicon and carbon.

Use: Low-carbon steel in which silicon is not objectionable. Silicon manganese steels are used for springs and high-strength structural steels. See also manganese steels and ferromanganese.

silicomolybdic acid. See 12-molybdosilicic acid.

silicon Si A non-metal (q.v.). Atomic number 14; Group IVA of the Periodic Table. Atomic weight 28.086; valence 4; 3 stable isotopes. It is the second most abundant element (25% of the earth's crust).

Properties: Dark-colored crystals (the octahedral form in which the atoms have the diamond arrangement). The so-called amorphous form consists of minute crystals. Soluble in a mixture of nitric and hydrofluoric acids and in alkalis; insoluble in water, nitric and hydrochloric acid. Sp. gr. 2.33; m.p. 1410°C ; b.p. 2355°C ; Mohs hardness 7; dielectric constant 12.

Occurrence: Does not occur free in nature, but is a major portion of silica and silicates (rocks, quartz, sand, clays, etc.). See silicate.

Derivation: Heating sand with coke in an electric furnace. Single crystals of ultrahigh purity are made on a commercial scale.

Purification: Treatment with hydrochloric and hydrofluoric acids. High purity is achieved by distillation of silicon tetrachloride, tetraiodide or silane, reduction to silicon with ultrapure zinc, and vacuum or argon zone refining.

Grades: Ferrosilicon (50% Si); regular (97% Si); semiconductor or hyperpure (99.97% Si).

Hazard: Tolerance, 10 mg per cubic meter of air. Flammable in powder form.

Uses: Alloying agent for steels, aluminum, bronze, copper, and iron (ferrosilicon); production of halogenated silanes; organosilicon compounds (silicone resins); silicon carbide; spring steels; deoxidizer in steel manufacture; semiconductor in integrated circuits, rectifiers, transistors, diodes, solar batteries, other solid state devices (single crystals doped with boron or phosphorus); cermets and other special refractories.

Shipping regulations: (Powder) (Air) Flammable solid label.

See also silica; silicate; silicone; ferrosilicon; silica gel.

silicon bromide. See silicon tetrabromide.

silicon-bronze. An alloy of copper, tin and silicon used for telephone and telegraph wires.

silicon carbide SiC.

Properties: Bluish black iridescent crystals; Mohs hardness 9; sp. gr. 3.217; sublimes with decomposi-

tion at 2700°C . Insoluble in water and alcohol; soluble in fused alkalis and molten iron. Excellent thermal conductivity; electrically conductive; resists oxidation at high temperatures. Noncombustible; a nuisance particulate.

Derivation: Heating carbon and silica in an electric furnace at about 2000°C .

Forms available: Powder; filament; whiskers (3 million psi); single crystals.

Containers: Bags, barrels, drums.

Uses: Abrasive for cutting and grinding metals; grinding wheels; refractory in nonferrous metallurgy, ceramic industry, and boiler furnaces; composite tubes for steam reforming operations. Fibrous form used in filament-wound structures and heat-resistant, high-strength composites.

See also "Carborundum"; "Crystalon"; "Carbofrax."

silicon chloride. See silicon tetrachloride.

silicon-copper (copper silicide).

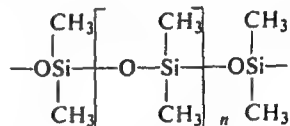

Properties: A hard, tough, bronze-like alloy containing 10-30% silicon.

Derivation: From silica and copper electrolytically.

Use: Manufacture of silicon-bronze.

silicon dioxide. See silica.

silicone. Any of a large group of siloxane polymers based on a structure consisting of alternate silicon and oxygen atoms with various organic radicals attached to the silicon:

Properties: Liquids, semisolids, or solids depending on molecular weight and degree of polymerization; viscosity ranges from less than 1 to over 1 million centistokes. Polymers may be straight-chain, or cross-linked with benzoyl peroxide or other free radical initiator, with or without catalyst. Stable over temperature range from -50 to $+250^\circ\text{C}$. Very low surface tension; extreme water repellency; high lubricity; excellent dielectric properties; resistant to oxidation, weathering, and high temperature; permeable to gases. Soluble in most organic solvents; unhalogenated types are combustible. Nontoxic.

Derivation: (1) Silicon is heated in methyl chloride to yield methylchlorosilanes; these are separated and purified by distillation, and the desired compound mixed with water. A polymeric silicone results. (2) Reaction of silicon tetrachloride and a Grignard reagent (RMgCl), with subsequent hydrolysis and polymerization.

Forms: Fluids, powders, emulsions, solutions, resins, pastes, elastomers.

Uses: (Liquid) Adhesives; lubricants; protective coatings; coolant; mold-release agent; dielectric fluid; heat transfer; wetting agent and surfactant; foam stabilizer for polyurethanes; diffusion pumps; anti-foaming agent for liquids; textile finishes; water repellent; weatherproofing concrete. (Resin) Coatings, molding compounds, laminates (with glass cloth); filament winding; sealants; room-temperature curing cements (see "RTV"); electrical insulation; impregnating electric coils; bonding agent; modifier for alkyd resins; vibration-damping devices. (Elastomer, or silicone rubber) Encapsulation of electronic parts; electrical insulation; gaskets; surgical membranes;

automobile engine components; flexible windows for face masks, air locks, etc.; medical devices used within the body; miscellaneous mechanical products.

silicone oil. See silicone (properties and uses).

silicone rubber. See silicone (properties and uses).

silicon fluoride. See silicon tetrafluoride.

silicon-gold alloy. See gold-silicon alloy.

silicon monoxide SiO.

Properties: Amorphous black solid; sp. gr. 2.15–2.18; sublimes at high temperature. Hard and abrasive. Noncombustible.

Grades: Lumps, powders, tablets; optical.

Uses: To form thin surface films for protection of aluminum coatings, optical parts, mirrors; dielectric or insulator.

silicon nitride Si₃N₄.

Properties: Gray powder (can be prepared as crystals); sublimes at 1900°C; density 3.44 g/cu m; bulk density 70–75 lb/cu ft, depending on mesh; Mohs hardness 9+; thermal conductivity 10.83 Btu/in/sq ft/hr/°F at 400–2400°F. Resistant to oxidation, various corrosive media, molten aluminum, zinc, lead and tin. Soluble in hydrofluoric acid.

Derivation: Reaction of powdered silicon and nitrogen in an electric furnace.

Uses: Refractory coatings; bonding silicon carbide; mortars; abrasives; thermocouple tubes in molten aluminum; crucibles for zone-refining germanium; rocket nozzles; high-strength fibers and whiskers; insulator and passivating agent in transistors and other solid-state devices.

silicon tetrabromide (silicon bromide) SiBr₄.

Properties: Fuming, colorless liquid. Turns yellow in air. Disagreeable odor. Decomposed by water with evolution of heat. Sp. gr. 2.82 (0°C); b.p. 153°C; m.p. 5°C. Noncombustible.

Containers: Sealed "Pyrex" or quartz ampoules.

Purity: 99.999%.

Hazard: Strong irritant to tissue.

silicon tetrachloride (silicon chloride) SiCl₄.

Properties: Colorless exceedingly mobile, fuming liquid; suffocating odor. Corrosive to most metals when water is present; in the absence of water it has practically no action on iron, steel, or the common metals and alloys, and can be stored and handled in metal equipment without danger. Sp. gr. 1.483 (20°C); wt 12.4 lb/gal; f.p. –70°C; b.p. 57.6°C; refractive index (n 20/D) 1.412. Miscible in all proportions with carbon tetrachloride, tin tetrachloride, titanium tetrachloride, and sulfur mono- and dichlorides. Decomposed by water and alcohol, with evolution of hydrochloric acid. Noncombustible.

Derivation: Heating silicon dioxide and coke in a stream of chlorine.

Grades: Technical; 99.5%; C.P. (99.8%); semiconductor.

Containers: Iron drums; bottles; tank cars.

Hazard: Highly toxic by ingestion and inhalation. Strong irritant to tissue.

Uses: Smoke screens; manufacture of ethyl silicate and similar compounds; production of silicones; manufacture of high-purity silica and fused silica glass; source of silicon, silica, and hydrogen chloride; laboratory reagent.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

silicon tetrafluoride (silicon fluoride) SiF₄.

Properties: Colorless gas; suffocating odor similar to hydrogen chloride; fumes strongly in air; sp. gr. (gas) (air = 1) 3.57 (15°C); f.p. –90°C; b.p. –86°C. Absorbed readily in large quantities by water with decomposition. Soluble in absolute alcohol. Noncombustible.

Derivation: (a) Action of hydrofluoric acid or concentrated sulfuric acid and a metallic fluoride on silica or silicates. (b) Direct synthesis.

Grade: Pure, 99.5% min.

Containers: Gas cylinders.

Hazard: Highly toxic by inhalation. Strong irritant to mucous membranes. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Manufacture of fluosilicic acid; to seal water out of oil wells during drillings.

Shipping regulations: (Rail) Green label. (Air) Nonflammable Gas label. Not acceptable on passenger planes.

silicon tetrahydride. See silane.

silicon tetraiodide SiI₄.

Properties: White crystals; m.p. 120°C; b.p. 290°C. Noncombustible.

Containers: Sealed "Pyrex" or quartz ampoules.

Purity: Up to 99.999%.

Hazard: Toxic by ingestion and inhalation. Irritant to tissue.

silicotungstic acid (12-tungstosilicic acid; silicowolframic acid) H₄SiW₁₂O₄₀ · 5H₂O.

Properties: White crystalline powder; exceptionally soluble in water and polar organic solvents; relatively insoluble in non-polar organic solvents. Strong acid; noncombustible.

Grades: Reagent; technical.

Uses: Catalyst for organic synthesis; reagents; additives to plating processes; as precipitants and inorganic ion-exchangers in atomic energy research.

See also sodium 12-tungstosilicate and tungstosilicates.

silicowolframic acid. See silicotungstic acid.

"Silicure" I-816.⁷⁴ Trademark for 6% iron octoate; used as a silicone catalyst.

"Silimite."¹¹⁶ Trademark for a high magnesium dolomitic lime used for silica reduction in hot-process water-softening equipment.

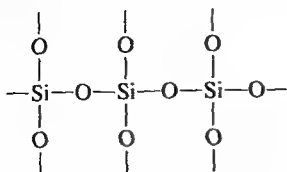

silk. A natural fiber secreted as a continuous filament by the silkworm, *Bombyx mori*. Silk consists essentially of the protein fibroin and, in the raw state, is coated with a gum, which is usually removed before spinning. Combustible, but self-extinguishing. Sp. gr. 1.25. Elongation at rupture about 20%; tenacity 3 to 5 grams/denier.

silimanite An aluminum silicate. A high heat-resisting material containing a maximum amount of mullite, developed from the alteration of andalusite during firing. This necessitates firing above 1550°C for the development of a suitable crystalline structure.

Uses: Spark plugs; chemical laboratory ware; pyrometer tubes; special porcelain shapes; furnace patch and refractories.

"Sil-O-Cel."²⁴⁷ Trademark for a type of diatomaceous earth used in filtration and insulation.

siloxane (oxosilane). A straight-chain compound (analogous to paraffin hydrocarbons) consisting of silicon atoms single-bonded to oxygen and so arranged that each silicon atom is linked with four oxygen atoms.

In some types, hydrogen may replace two or more of the oxygens. Disiloxane and trisiloxane are examples. See also silicone.

"Silpowder."³¹ Trademark for a commercially pure silver, metallic impurities 0.1% max. Particle size, 5 to 125 microns depending on grade.

Derivation: By precipitation from solutions of silver salts and by atomization.

Grades: 120, 130, 140, 150 and 160 (galvanic and chemical precipitates of variable size and density).

Uses: Powder metallurgy parts such as electrical contacts, batteries and brushes; pigments for conductive coatings and adhesives.

"Sil-Temp."³⁴⁹ Trademark for a substantially pure fibrous silica for use in rocket and missile constructions and for high temperature insulation of motor components and similar applications. As a construction material it is used in laminate form impregnated and bonded with high-temperature resins.

"Sil-Trode."⁴⁰⁷ Trademark for silicon bronze electrodes and filler rod for use in inert gas welding.

"Silvacel."¹²⁹ Trademark for a series of wood fibers. **Uses:** Insulation; pulp molding; special papers and boards where high bulk and absorbent qualities are desirable; filter aid and filter media; treatment of oil well drilling muds.

"Silvacon."¹²⁹ Trademark for a series of products made from Douglas fir (*Pseudotsuga taxifolia*) bark. **Uses:** Phenolic adhesive extender; molding compound component; conditioner for fertilizer, insecticides, etc.; burnout material in foundry sands; rubber sponge manufacture; other vinyl and rubber compounds; treatment of oil well drilling fluids; replacement for cork.

silver Ag Metallic element, atomic number 47, Group I B of the periodic table. Atomic weight 107.868. Valence 1; two stable isotopes.

Properties: Soft, ductile, lustrous white solid. Highest electrical and thermal conductivity of all metals. Resists oxidation, but tarnishes in air through reaction with atmospheric sulfur compounds. Sp. gr. 10.53; m.p. 961°C; b.p. 2212°C. Thermal conductivity 1.01 cal/cm/sec/°C. Absorbs oxygen strongly at melting point. Soluble in nitric acid, hot sulfuric acid, and alkali cyanide solutions; insoluble in water and alkalies. Noncombustible, except as powder.

Derivation: By-product of operations on copper, zinc, lead, or gold ores, but some smelters still operate on native silver. The recovery ranges from 166 ounces to a few thousandths of an ounce per ton. See Parkes process; Pattinson process. The chief silver ores are native silver, argentite (silver sulfide) and cerargyrite (silver chloride).

Forms available: Pure ("fine"), sterling (7.5% Cu), various alloys, plate; ingot, bullion, moss, sheet, wire,

tubing, castings; powder; high purity (impurities less than 100 ppm); single crystals; whiskers.

Hazard: Tolerance (metal and soluble compounds): 0.01 mg per cubic meter of air. Moderately toxic when absorbed in circulatory system.

Uses: Manufacture of silver nitrate, silver bromide, photographic chemicals; lining vats and other equipment for chemical reaction vessels, water distillation, etc.; catalyst in manufacture of ethylene; mirrors; electric conductors, such as bus bars; batteries; silver plating; electronic equipment; sterilant; low-temperature brazing alloys; table cutlery, jewelry; dental, medical and scientific equipment; electrical contacts; bearing metal; magnet windings; dental amalgams. Colloidal silver is used as a nucleating agent in photography, and in medicine, often combined with protein. See "Argyrol."

silver acetate CH_3COOAg .

Properties: White crystals or powder; sp. gr. 3.26. Moderately soluble in hot water; soluble in nitric acid.

Hazard: Toxic. Tolerance, 0.01 mg per cubic meter of air.

Use: Medicine (external); laboratory reagent.

silver acetylide Ag_2C_2 .

Properties: White powder. A salt of acetylene.

Derivation: Reaction of acetylene with aqueous solution of argentous salts.

Hazard: Severe explosion risk when shocked or heated.

Uses: Detonators.

Shipping regulations: (Rail, Air) Explosives, n.o.s., Not acceptable.

silver arsenite Ag_3AsO_3 .

Properties: Fine, yellow powder. Sensitive to light. Soluble in acetic acid, ammonium hydroxide, and nitric acid; insoluble in alcohol and water. M.p. 150°C (decomposes).

Hazard: Highly toxic. Tolerance, 0.01 mg per cubic meter of air.

Use: Medicine.

Shipping regulations: (Rail, Air) Poison label.

silver arsphenamine (silver diaminodihydroxyarsenobenzene, sodium salt).

Properties: Brownish black powder (containing approximately 20% arsenic, 15% silver) for which the exact molecular formula has not been established. Unstable in air. Soluble in water.

Derivation: Action of silver salts on arsphenamine, converting the product to the disodium salt and precipitating with alcohol, acetone, or ether.

Hazard: Highly toxic. Tolerance, 0.01 mg per cubic meter of air.

Use: Medicine.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

silver bromate AgBrO_3 .

Properties: White powder. Sensitive to light. Keep in amber bottle. Soluble in ammonium hydroxide; slightly soluble in water (hot). Decomposed by heat. Sp. gr. 5.2.

silver bromide AgBr .

Properties: Pale yellow crystals or powder, darkening on exposure to light, finally turning black. Sp. gr. 6.473 (25°C); m.p. 432°C; b.p. decomposes at 700°C. Soluble in potassium bromide, potassium cyanide and sodium thiosulfate solutions; very slightly soluble in ammonia water; insoluble in water. Light-sensitive.

Derivation: Silver nitrate is dissolved in water and a

solution of alkali bromide added slowly. The precipitated silver bromide is washed repeatedly with hot water; the operation must be carried on in a dark-room under a ruby red light.

Containers: Amber or black glass bottles.

Use: Photograph film and plates; photochromic glass; laboratory reagent.

silver carbonate Ag_2CO_3 .

Properties: Yellow to yellowish gray powder. Contains 78% (approx.) silver. Light-sensitive. Soluble in ammonium hydroxide, nitric acid; insoluble in alcohol and water. Sp. gr. 6.077; decomposes at 218°C .
Uses: Laboratory reagent.

silver chloride AgCl .

Properties: White granular powder, which darkens on exposure to light, finally turning black. Exists in several modifications differing in conduct toward light and also in their solubility in various solvents. Soluble in ammonium hydroxide, concentrated sulfuric acid and sodium thiosulfate and potassium bromide solutions; very slightly soluble in water. Can be melted, cast and fabricated like a metal. Sp. gr. 5.56; m.p. 445°C ; b.p. 1550°C .

Derivation: Silver nitrate solution is heated and hydrochloric acid or salt solution added. The whole is boiled, then filtered, all in the dark or under a ruby-red light.

Method of purification: Re-solution in ammonium hydroxide and precipitation by hydrochloric acid.

Grades: Technical; C.P.; single pure crystals.

Containers: Amber or black glass bottles.

Uses: Photography; photometry and optics; batteries; photochromic glass; silver plating; production of pure silver; medicine. Single crystals are used for infrared absorption cells and lens elements; laboratory reagent.

silver chromate Ag_2CrO_4 .

Properties: Dark, brownish red, powder. Soluble in acids, ammonium hydroxide, potassium cyanide, solutions of alkali chromates; insoluble in water. Sp. gr. 5.625.

Use: Laboratory reagent.

silver cyanide AgCN .

Properties: White, odorless, tasteless powder which darkens on exposure to light. Soluble in ammonium hydroxide, dilute boiling nitric acid and potassium cyanide and sodium thiosulfate solutions; insoluble in water. Sp. gr. 3.95; decomposes at 320°C .

Derivation: By adding sodium or potassium cyanide to a solution of silver nitrate.

Containers: Amber or black glass bottles.

Hazard: Highly toxic by ingestion or inhalation. Tolerance, 0.01 mg per cubic meter of air.

Uses: Medicine; silver plating.

Shipping regulations: (Rail) Cyanides, Poison label. (Air) Poison label.

silver dichromate (silver bichromate) $\text{Ag}_2\text{Cr}_2\text{O}_7$.

Properties: Dark red, almost black, crystalline powder; sp. gr. 4.770; soluble in ammonium hydroxide and nitric acid; slightly soluble in water.

Hazard: Tolerance, 0.01 mg per cubic meter of air.

silver fluoride $\text{AgF} \cdot \text{H}_2\text{O}$.

Properties: Yellow, or brownish, crystalline masses. Very hygroscopic. Becomes dark on exposure to light. Light-sensitive. Soluble in water. Sp. gr. 5.852 (anhydrous); m.p. 435°C ; b.p. ca. 1159°C .

Hazard: Toxic; strong irritant. Tolerance, 0.01 mg per cubic meter of air.

Use: Medicine.

silver iodide AgI .

Properties: Pale yellow, odorless, tasteless powder, darkening on exposure to light. Soluble in hydriodic acid, potassium iodide, potassium cyanide, ammonium hydroxide, sodium chloride and sodium thiosulfate solutions; insoluble in water. Light-sensitive. Sp. gr. 5.675; m.p. 556°C .

Derivation: Silver nitrate solution is heated, alkali iodide solution added and the precipitate washed with boiling water in the dark or under ruby red illumination.

Containers: Amber or black glass bottles.

Hazard: Moderately toxic.

Uses: Medicine; photography; cloud seeding for artificial rain-making; laboratory reagent.

"Silver-Lume" A.B.²⁸⁸ Trademark for a bright silver electroplating process for use by silversmiths and electronics manufacturers. The materials used are silver cyanide, potassium cyanide, potassium carbonate, and addition agents.

silver mercury iodide. See mercuric silver iodide.

silver methylarsonate (methanearsonic acid, disilver salt) $\text{CH}_3\text{AsO}_3\text{Ag}_2$.

Derivation: Reaction of disodium methylarsonate with silver salts.

Hazard: Highly toxic. Tolerance, 0.01 mg per cubic meter of air.

Use: Algicides.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

silver nitrate AgNO_3 .

Properties: Colorless, transparent, tabular, rhombic crystals, becoming gray or grayish-black on exposure to light in the presence of organic matter; odorless; bitter, caustic metallic taste; strong oxidizing agent and caustic. Soluble in cold water; more soluble in hot water, glycerol and hot alcohol; slightly soluble in either. Sp. gr. 4.328; m.p. 212°C ; b.p. decomposes.

Derivation: Silver is dissolved in dilute nitric acid and the solution evaporated. The residue is heated to a dull red heat to decompose any copper nitrate, dissolved in water, filtered and recrystallized.

Grades: Technical; C.P.; U.S.P.

Containers: Amber or black glass bottles.

Hazard: Tolerance, 0.01 mg per cubic meter of air. Highly toxic and strong irritant to skin and tissue.

Uses: Photography; mother of pearl; reagent; silver plating; indelible ink; silver salts; glass manufacture; silvering mirrors; germicide (as a wall spray); weak solutions are used in hair dyeing and as antiseptic; fused form to cauterize wounds; laboratory reagent.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

silver nitride Ag_3N .

Properties: Colorless, solid.

Derivation: Reaction of silver compounds with ammonia, with or without additives.

Hazard: Severe explosion hazard when shocked. It is unusually sensitive to mechanical action of any kind, and can explode even in water suspension.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

silver nitrite AgNO_2 .

Properties: Small, yellow, or grayish yellow needles. Become gray on exposure to light. Contain 70% (approx.) silver. Decomposes by acids. Soluble in (hot) water; insoluble in alcohol. Decomposes at 140°C . Sp. gr. 4.453 (26°C).

Hazard: Tolerance, 0.01 mg per cubic meter of air.

Uses: Organic synthesis; standardizing potassium permanganate solutions; water analysis; analysis (testing for alcohols).

silver orthophosphate. See silver phosphate.**silver oxide** (argentic oxide) Ag_2O .

Properties: Dark brown or black odorless powder; metallic taste. Soluble in ammonium hydroxide, potassium cyanide solution, nitric acid and sodium thiosulfate solution; slightly soluble in water; insoluble in alcohol. Sp. gr. 7.14 (16°C); m.p. decomposes when heated above 300°C . Strong oxidizing agent.

Derivation: Silver nitrate and alkali hydroxide solutions are mixed, the precipitate filtered and washed.

Grades: Technical; up to 99.6% pure, particle size 2-3 microns.

Containers: Jars; 1-, 5-gal cans.

Hazard: Fire and explosion risk in contact with organic materials or ammonia. Moderately toxic.

Uses: Medicine; polishing glass; coloring glass yellow; catalyst; purifying drinking water; battery plates; laboratory reagent.

silver oxide battery. See zinc-silver oxide battery.**silver permanganate** AgMnO_4 .

Properties: Violet, crystalline powder. Sp. gr. 4.27 (25°C); m.p., decomposes. Contains 47.5% (approx.) silver. Decomposed by alcohol. Light-sensitive; use dark-colored bottles.

Grade: Technical.

Hazard: Dangerous explosion risk; may detonate if shocked or heated.

Uses: Gas masks; medicine.

Shipping regulations: Permanganates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

silver peroxide (argentic oxide) Ag_2O_2 .

Properties: Grayish powder; sp. gr. 7.44 (25°C); decomposes above 100°C ; insoluble in water; soluble in sulfuric acid, nitric acid, and ammonium hydroxide.

Containers: 80-oz jars in metal outer-containers.

Hazard: Dangerous fire and explosion risk; strong oxidizing agent. Keep out of contact with organic materials.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

silver phosphate (silver orthophosphate) Ag_3PO_4 .

Properties: Yellow powder; turns brown when heated or on exposure to light. Soluble in acids, potassium cyanide solution, ammonium hydroxide, ammonium carbonate, and acetic acid; very slightly soluble in water. Sp. gr. 6.370 (25°C); m.p. 849°C .

Derivation: Interaction of silver nitrate and sodium phosphate.

Containers: Amber or black glass bottles.

Hazard: Moderately toxic.

Uses: Photographic emulsions; catalyst; pharmaceuticals.

silver picrate $\text{C}_6\text{H}_2\text{O}(\text{N})_3\text{Ag} \cdot \text{H}_2\text{O}$.

Properties: Yellow crystals containing 30% silver; soluble in water; slightly soluble in alcohol and acetone; insoluble in ether and chloroform.

Hazard: Severe explosion risk.

Use: Medicine.

Shipping regulations: (Air) Explosives, n.o.s., Not acceptable. (Rail) Consult regulations.

silver potassium cyanide (potassium cyanoargentate; potassium argentocyanide) $\text{KAg}(\text{CN})_2$.

Properties: White crystals; sp. gr. 2.36 (25°C); sensitive to light. Soluble in water and alcohol; insoluble in acids.

Derivation: By adding silver chloride to a solution of potassium cyanide.

Containers: Glass bottles.

Hazard: Highly toxic. Tolerance, 0.01 mg per cubic meter in air.

Uses: Silver plating; bactericide; antiseptic.

silver sodium chloride (sodium silver chloride) $\text{AgCl} \cdot \text{NaCl}$.

Properties: Hard, white crystals. Decomposed by water. Soluble in solution of sodium chloride (conc.).

silver sodium thiosulfate (sodium silver thiosulfate) $\text{Ag}_2\text{S}_2\text{O}_3 \cdot 2\text{Na}_2\text{S}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White or gray, crystalline powder. Sweet taste; soluble in water.

silver, sterling. See sterling silver.**silver sulfate** (silver sulfate, normal) Ag_2SO_4 .

Properties: Small, colorless, lustrous crystals or crystalline powder. Contains 69% (approx.) silver. Turns gray on exposure to light. Soluble in ammonium hydroxide, nitric acid, sulfuric acid, (hot) water; insoluble in alcohol. Sp. gr. 5.45 (29°C); b.p. 1085°C (decomposes); m.p. 652°C .

Grades: Technical; C.P.

Hazard: Tolerance, 0.01 mg per cubic meter of air.

Use: Laboratory reagent.

silver sulfate, normal. See silver sulfate.**silver sulfide** Ag_2S .

Properties: Grayish black powder. Soluble in concentrated sulfuric and nitric acids; insoluble in water. Sp. gr. 7.32 (25°C); b.p. decomposes; m.p. 825°C .

Derivation: By passing hydrogen sulfide gas into silver nitrate solution, washing and drying.

Uses: Inlaying in niello metal-work; ceramics.

silvex. Generic name for 2-(2,4,5-trichlorophenoxy)-propionic acid (fenoprop)

$\text{Cl}_3\text{C}_6\text{H}_2\text{OCH}(\text{CH}_3)\text{COOH}$.

Properties: Solid; m.p. $180.4-181.6^\circ\text{C}$. Slightly soluble in water; freely soluble in acetone, methyl alcohol. Combustible.

Hazard: May be toxic.

Uses: Herbicide and plant growth regulator.

Also available in form of esters, as 2,4,5-trichlorophenoxypropionic acid, 2-ethylhexyl ester (see "Silvi-Rhap").

silvichemical. A chemical derived from wood, e.g., lignins, lignosulfonates (from spent sulfite liquor); vanillin; yeast (from fermentation of wood sugars); tall oil; sulfate turpentine; bark extracts; phenolic materials.**silvicide.** A nonselective herbicide used to kill or defoliate bushes and small trees, e.g., ammonium sulfamate.**"Silvi-Rhap."**²⁶⁶ Trademark for 2-ethylhexyl ester of 2-(2,4,5-trichlorophenoxy)propionic acid. Used as a herbicide.

Hazard: May be toxic.

simazine. Generic name for 2-chloro-4,6-bis(ethylamino)-s-triazine $\text{ClC}_3\text{N}_3(\text{NHC}_2\text{H}_5)_2$.

Properties: White solid; m.p. 225°C . Insoluble in water; slightly soluble in organic solvents. Combustible.

Hazard: Moderately toxic by ingestion and inhalation; irritant to mucous membranes.

Use: Herbicide.

"Simconex."¹⁶⁰ Trademark for silicone-base insulation used in power cables.

Simons process. An electrochemical fluorination process which makes fluorocarbons by passing an electric current through a mixture of the organic starting compound and liquid anhydrous hydrogen fluoride. The products are hydrogen and the desired fluorocarbon.

simple distillation. Distillation in which no appreciable rectification of the vapor occurs, i.e., the vapor formed from the liquid in the still is completely condensed in the distillate receiver and does not undergo change in composition due to partial condensation or contact with previously condensed vapor.

"Singoserp."³⁰⁵ Trademark for syrosingopine.

sintering. The agglomeration of metal or earthy powders at temperatures below the melting point. Occurs in both powder metallurgy and ceramic firing. While heat and pressure are essential, decrease in surface area is the critical factor. (see Rittinger's law). Sintering increases strength, conductivity, and density.

"Sipenol."⁵⁴² Trademark for ethoxylated fatty and short-chain amines. Used in cosmetics, textile industry, metal cleaning, agricultural emulsifiers, chemical and pharmaceutical intermediates.

"Sipex."⁵⁴² Trademark for industrial grade alcohol sulfates and alcohol ethoxylate sulfates. Used in detergents, emulsion polymerization, and textile industry. Available are principally ammonium, magnesium, sodium and triethanolamine lauryl sulfates, sodium tridecyl sulfate, sodium 2-ethylhexyl sulfate, and sodium lauryl ethoxylate sulfate. See also "Sipon."

"Sipomer."⁵⁴² Trademark for a group of speciality monomers; used in polymerization. They include dimethylaminoethyl methacrylate, hydroxyethyl methacrylate, dimethyl and diethyl maleates, and allyl glycolate.

"Sipon."⁵⁴² Trademark for a cosmetic grade of fatty alcohol sulfates and fatty alcohol ethoxylate sulfates. They include approximately the same materials as the "Sipex" grade, and also diethanolamine lauryl sulfate, sodium cetyl sulfate, and ammonium lauryl ethoxylate sulfate.

"Siponate."⁵⁴² Trademark for purified alkylarylsulfonates, including sodium dodecyl benzene sulfonate (branched or linear), and sodium lauroyl monoglyceride sulfate.

"Siponic."⁵⁴² Trademark for fatty alcohol ethoxylates. Used in detergents, cosmetics, finishes, and coatings. Available are ethoxylated lauryl alcohol, oleyl alcohol, and stearyl-cetyl alcohol.

SIPP. Abbreviation for sodium iron pyrophosphate.

"Sirlene."²³¹ Trademark for feed grade of propylene glycol.

sisal.

Properties: Hard, strong, light yellow to reddish fibers obtained from the leaves of *Agave sisilana*. Combustible; not self-extinguishing. Strength, 4.5 grams per denier; fineness ranges from 300 to 500 denier.

Source: Africa; Java; Haiti; Bahama.

Hazard: Moderate, by inhalation. Dust is flammable.

May ignite spontaneously when wet.

Uses: Twine; rope; sacking; upholstery; life preservers.

"Sitol."²⁸ Trademark for an oxidizing agent in flake form used in discharge printing.

beta-sitosterol $\text{C}_{29}\text{H}_{50}\text{O}$. 22,23-Dihydrostigmasterol.

Properties: Waxy white solid; almost odorless and tasteless; insoluble in water, soluble in benzene, chloroform, carbon disulfide and ether. Can be crystallized from ether as anhydrous needles, or from aqueous alcohol as leaflets with one molecule of water.

Derivation: Soybeans.

Uses: Biochemical research. See also cholesterol.

"Sixide."³¹⁹ Trademark for insecticidal preparations containing benzene hexachloride.

size oil. See throwing oil.

sizing compound. (1) A material such as starch, gelatin, casein, gums, oils, waxes, asphalt emulsions, silicones, rosin, and water-soluble polymers applied to yarns, fabrics, paper, leather and other products to improve or increase their stiffness, strength, smoothness or weight. (2) A material used to modify the cooked starch solutions applied to warp ends prior to weaving. See also slashing compound.

"Skamex."²⁸ Trademark for a fluorocarbon plastic used as a metallurgical additive for the beneficiation of molten metal. Cakes and slugs of it are specifically designed for immersion in hot metal for removal of excessive quantities of dissolved hydrogen. Other forms are added to molds during casting to create a protective atmosphere against the effects of absorbed oxygen. Can be used for ferrous and non-ferrous metals.

Containers: Powder, pellets, cakes and slugs: 50-lb drums. Mold wash: 100-lb 44% concentrate, 25-gal drums.

skatole (3-methylindole) $\text{C}_9\text{H}_9\text{N}$.

Properties: White crystalline substance, browning upon aging; fecal odor. M.p. 93° to 95°C ; b.p. 265°C . Soluble in hot water, alcohol, benzene. Gives violet color in potassium ferrocyanide and sulfuric acid.

Derivation: Feces; African civet cat; *Celtis reticulosa*, a Javanese tree.

Use: Perfumery (fixative); artificial civet.

"Skellysolves."⁴⁰⁹ Trademark for straight-run aliphatic naphthas having various boiling ranges, specific gravities, evaporation rates and other properties, which make them suitable for a number of industrial uses.

Hazard: Flammable; dangerous fire risk.

Skraup synthesis. Synthesis of quinoline or its derivatives by heating aniline or an aniline derivative, glycerol and nitrobenzene in the presence of sulfuric acid.

"Skydrol."⁵⁸ Trademark for a line of fire-resistant aircraft hydraulic fluids.

500-A. Used for hydraulic systems in turbo jet and turbo prop aircraft, which must operate at -65°F .
 7000. Used in aircraft cabin superchargers, expansion turbines for air-conditioning systems and the aircraft hydraulic system itself.

slack. (1) Descriptive of a soft paraffin wax resulting from incomplete pressing of the settlings from the petroleum distillate. Though it has some applications in this form, it is actually an intermediate product between the liquid distillate and the scale wax made by expressing more of the oil. See also scale (2).

(2) Specifically, to react calcium oxide (lime) with water to form calcium hydroxide (slacked or hydrated lime); the reaction is $\text{CaO} + \text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2 + \text{heat}$. The alternate spelling "slake" has the same meaning.

slaframine (1-acetoxy-8-aminooctahydroindolizine). An alkaloid derived from a fungus that infests clover. It is under research development for use as an agent in retarding cystic fibrosis.

slag. The fused agglomerate which separates in metal smelting and floats on the surface of the molten metal. Formed by combination of flux with gangue of ore, ash of fuel, and perhaps furnace lining. The slag is often the medium by means of which impurities may be separated from metal.

Uses: Railroad ballast; highway construction; cement and concrete aggregate; raw material for Portland cement; raw material for glass fibers (see mineral wool); fertilizer.

slake. See slack.

slaked lime. See calcium hydroxide; lime, hydrated.

slashing compound. A textile sizing material applied to cotton or rayon warp ends by a special machine (slasher).

slate. A fine-grained metamorphic rock which cleaves into thin slabs or sheets. Color usually gray to black, sometimes green, yellow, brown or red. Slates are composed of micas, chlorite, quartz, hematite, clays, and other minerals.

Occurrence: Pennsylvania, Vermont, Maine, Virginia, California, Colorado; Europe.

Uses: Roofing; blackboards; (as powder) filler in paint, rubber; abrasive.

slate black. See mineral black.

slate flour. Finely divided slate used as a filler and dusting agent in rubber, plastics, etc.

slate, green. See slate flour.

"S.L." Chemicals.¹²⁹ (Standard Luminescent). Trademark for chemicals specially developed and standardized to meet the exacting requirements of phosphor manufacture.

slimicide. A chemical which is toxic to the types of bacteria and fungi characteristic of aqueous slimes. Examples are chlorine and its compounds, organomercurial compounds, phenols, and related substances. Used largely in paper mills, and to some extent in textile and leather industries.

slip clay. A type of clay containing such a high percentage of fluxing impurities and of such a texture that it melts at a relatively low temperature to a greenish or brown glass, thus forming a natural glaze. It must be fine-grained, free from lumps or concretions, show a low air-shrinkage and mature in burning at as little above 1300°F as possible.

"Slip-Eze."⁴³⁰ Trademark for a specially prepared fatty acid amide. Used as a slip additive and as an internal mold-release additive to polyethylene.

"Slipicone."¹⁴⁹ Trademark for fluid silicone compositions to prevent adhesion of materials to one another. Used on food-processing and packaging equipment.

sludge. A soft mud, slush, or mire; for example, the solid product of a filtration process before drying (filter cake). See also sewage sludge.

sludge acid. Waste or spent sulfuric acid, usually that from refining petroleum oils or crude benzenes.

Hazard: Highly toxic; strong irritant.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

"Sludge Conditioner."¹⁰⁸ Trademark for a series of polyelectrolytes.

Containers: Bags; drums.

Uses: Conditions sludge for dewatering and settling in municipal sewage treatment plants.

slurry. A thin watery suspension; for example, the feed to a filter press or to a fourdrinier machine; also a stream of pulverized metal ore. A special use of this term refers to a type of explosives called "slurry blasting agents" based on gelatinized aqueous ammonium nitrate, sensitized with various other explosives.

slushing compound. A nondrying oil, grease or similar compound which, when coated over a metal, affords temporary protection against corrosion.

Sm Symbol for samarium.

"SM-30."²⁴¹ Trademark for a catalyst designed for the production of maximum yields of gasoline and light cycle oil. Typical analysis: magnesia, 27.5% and silica, 68.8%.

smalt.

Properties: Blue powder.

Derivation: A potash-cobalt glass made by fusing pure sand and potash with cobalt oxide, grinding and powdering.

Containers: Wooden kegs; multiwall paper sacks.

Uses: Paint pigments; ceramic industries (pigment); coloring glass; bluing paper, starch and textiles; coloring rubber.

"SMA" Resins.⁵⁶⁶ Trademark for a family of short-chain copolymers of styrene and maleic anhydride that offer typical anhydride functionality in a polymeric material.

Uses: Protective colloid in emulsion polymerization, a leveling resin in floor polishes, a dispersant in aqueous pigment systems, and a cross-linking agent for epoxy resins.

smectic. A phase of matter intermediate between solid and liquid, in which flow is not the normal liquid type. It is studied by polarized light, x-ray diffraction, and nuclear magnetic resonance. See also liquid crystal.

smelting. Heat treatment of an ore to separate the metallic portion, with subsequent reduction. See also roasting.

"Smentox."²¹⁶ Trademark for a chemical compound for reconditioning cement-contaminated drilling mud, or for preventing mud from becoming cement-contaminated, since contact with cement flocculates untreated drilling mud, rendering it unfit for use.

"Smite."²⁸ Trademark for emulsifiable insecticide containing 12.5% methoxychlor and 12.5% malathion. Containers: 1-pt, 1-qt bottles.

"Smithol 25."⁴⁰³ Trademark for a synthetic fatty alcohol ester of fatty acids to substitute for 45°NW sperm oil. May replace sperm oil, lard oil, olive oil, and other natural fatty oils for industrial uses. The lower cloud point and pour point and the fact that it does not have the objectionable odor of some natural oils makes it attractive for many applications where natural oils have limitations.

smog. A coined word denoting a persistent combination of smoke and fog occurring under appropriate meteorological conditions in large metropolitan or heavy industrial areas. The discomfort and danger of smog is increased by the action of sunlight on the combustion products in the air, especially sulfur dioxide, nitric oxide and exhaust gases (photochemical smog). Strongly irritating and even toxic substances may be present, e.g., peroxybenzoyl nitrate (q.v.). Fatalities have resulted from particularly severe photochemical smogs. See also air pollution.

smoke. A colloidal or microscopic dispersion of a solid in a gas; an aerosol.

(1) Coal smoke: A suspension of carbon particles in hydrocarbon gases or in air, generated by combustion. The larger particles can be removed by electrostatic precipitation in the stack (see Cottrell). Dark color, nauseating odor. See also smog; air pollution.

(2) Wood smoke: Light-colored particles of cellulose ash; pleasant aromatic odor. Smoke from special kinds of wood (e.g., hickory, maple) is used to cure ham, fish, etc., also to preserve crude rubber.

(3) Chemical smoke (q.v.): Generated by chemical means for military purposes (concealment, signaling, etc.).

(4) Metallic smoke (fume): An emanation from heated metals or metallic ores, the particles being of specific geometric shapes. Such smoke is particularly damaging to vegetation in the neighborhood of zinc and tin smelters.

(5) Cigarette smoke. There is rather conclusive evidence that the tars occurring in cigarette smoke can lead to lung cancer; chief factors are age of individual at initiation of smoking, extent of inhalation, and number smoked per day. Polonium, a radioactive element, is known to occur in cigarette smoke; more than 100 compounds have been identified including nicotine, cresol, pyridene, and benzopyrene, the latter a known carcinogen. See also cigarette tar.

smokeless powder. Nitrocellulose containing about 13.1% nitrogen, produced by blending material of somewhat lower (12.6%) and slightly higher (13.2%) nitrogen content, converting to a dough with alcohol-ether mixture, extruding, cutting and drying to a hard horny product. Small amounts of stabilizers, (amines) and plasticizers are usually present, as well as various modifying agents (nitrotoluene, nitroglycerin salts).

Hazard: A low explosive; dangerous fire and explosion risk when exposed to flame or impact.

Uses: Sports ammunition; military purposes.

Shipping regulations: (Air) Not acceptable. (Rail) Consult regulations.

"Smoothawl."⁴⁸¹ Trademark for a vinyl latex spackling paste.

smudge oil. An oil burned in fruit orchards to prevent frost from injuring the trees. No. 3 fuel oil is typical of oils used.

Sn Symbol for tin (from Latin stannum).

snake venom. There are two functional types: (1) those that bring about blood coagulation either by direct action on fibrogen or by converting prothrombin to thrombin; (2) neurotoxins that act on the central nervous system, e.g., by inactivation of acetylcholine. Rattlesnake and moccasin venom are examples of (1) and cobra venom of (2). The enzymes of snake venoms are thought to be the actual toxic principles. Solutions of cobra venom have found use in treatment of arthritis and cancer. The chemistry and pharmacological properties of these poisons are not well understood.

Note: A person bitten by a poisonous snake should be carried, *not* walked, to a hospital. *No alcohol* should be administered.

SNG. Abbreviation for synthetic natural gas (q.v.).

"Snodotte."²²¹ Trademark for a marine oil fatty acid; predominant chain length about 30% C₁₆.

snow, artificial. See artificial snow.

"Snowfine."²⁹² Trademark for a powdered form of sodium sesquicarbonate. See "Snowflake."

"Snowflake."²⁹² Trademark for sodium sesquicarbonate (Na₂CO₃ · NaHCO₃ · 2H₂O); small white sparkling needle-like crystals of uniform size which are free flowing and non-caking under normal conditions.

Uses: Base for household and industrial cleansers where mild alkaline action is desired, and as a base for both foaming and non-foaming bath salts.

Containers: 100-lb paper bags; 325-lb fiber drums; bulk.

SNTA. Abbreviation for sodium nitrilotriacetate.

soap. (1) The water-soluble reaction product of a fatty acid ester and an alkali (usually sodium hydroxide), with glycerol as by-product. For the reaction, see saponification. A soap is actually a specific type of salt (q.v.), the hydrogen of the fatty acid being replaced by a metal, which in common soaps is usually sodium. Soap lowers the surface tension of water and thus permits emulsification of fat-bearing soil particles. A typical commercial cleansing soap is made by reacting sodium hydroxide with a fatty acid. The lower the hydrogen content of the acid, the thinner the soap. The by-product of the reaction is glycerol (see saponification). Many different carboxyl-containing substances are used, including rosin, tall oil, vegetable and animal oils and fats (stearic, palmitic, and oleic acids). Olive oil is used for Castile soap; transparent soaps are made from decolorized fats. The specific gravity of soaps is slightly more than 1.0; inclusion of air gives a floating product. Water solutions of sodium soaps in bar, chip, or powder form are universally used as mild emulsifying detergents for washing textiles, skin, paint, etc. Liquid green soap is made with potassium hydroxide and a vegetable oil. For further information refer to Soap and Detergent Assn., 485 Madison Ave., New York.

(2) Heavy-metal soaps (loosely called metallic soaps) are those in which metals heavier than sodium are used (aluminum, calcium, cobalt, lead, zinc). These soaps are not water-soluble; specific types are

used in lubricating greases, gel thickeners, and in paints as driers and flattening agents. Napalm is an aluminum soap. See also saponification; detergent; drier.

soap builder. Any material mixed with soap to improve the cleaning properties, modify the alkali content, or impart water-softening characteristics. The commonest are some of the sodium phosphates, and rosin.

soap, heavy metal. See soap (2).

soap, soft. See green soap; soap.

soapstone. See talc.

Society of Chemical Industry. This society was founded in London in 1881 to advance applied chemistry in all its branches. The American Section was established in 1894. In 1906, on the anniversary of the "birth of the coal-tar industry," it founded the famous Perkin Medal, which has since been awarded annually for outstanding achievement in chemistry in the United States. It has also offered the Chemical Industry Medal since 1932, given for conspicuous service to applied chemistry. Perkin Medalists include L. H. Baekeland, F. G. Cottrell, Irving Langmuir, Herbert Dow, A. D. Little, R. R. Williams, Glenn T. Seaborg, and Roger Adams.

Society of Plastics Engineers (SPE). An incorporated technical organization devoted primarily to the application of sound engineering principles to the manufacture and use of plastics, this rapidly growing organization (founded in 1942) has contributed much to the correct evaluation of these versatile materials in many fields. It publishes a monthly journal and sponsors a series of technical books on both theoretical and applied aspects of plastics technology. Its headquarters is at Greenwich, Conn.

Society of the Plastics Industry (SPI). An incorporated technical organization serving the needs of the entire plastics industry in the United States. It establishes standards for the properties and selection of materials and for product design and engineering. Its two major publications are the "Plastics Engineering Handbook" (4th Edition) and the "Reinforced Plastics Handbook." With it are associated the Plastics Pipe Institute and the Reinforced Plastics/Composites Institute. Its offices are at 250 Park Ave., New York.

SOCMA. Abbreviation for Synthetic Organic Chemical Manufacturers Association.

soda. Any one of the forms of sodium carbonate (q.v.); also used loosely as equivalent to the word sodium in compounds.

soda alum. See aluminum sodium sulfate.

soda ash (soda, calcined; sodium carbonate, anhydrous). Na_2CO_3 . The crude sodium carbonate of commerce. Tenth highest-volume chemical produced in the U.S. (1975).

Properties: Grayish white powder or lumps containing up to 99% sodium carbonate. Soluble in water; insoluble in alcohol. Noncombustible; nontoxic.

Derivation: For nearly a century most of the soda ash produced in the U.S. has been made synthetically by the ammonia soda (Solvay) process (q.v.). Largely because of high energy costs and strict pollution controls, most of the synthetic production is being abandoned in favor of the natural product obtained from deposits in Utah, California, Wyoming, etc. One of the largest producing sites of the natural product is in Green River, Wyoming.

Impurities: Sodium chloride, sodium sulfate, calcium carbonate and magnesium carbonate, sodium bicarbonate.

Grades: Dense 58%; light 58%; extra light; natural; refined.

Containers: Bags; barrels; drums; bulk.

Uses: Glass manufacture; chemicals; pulp and paper manufacture; sodium compounds; soaps and detergents; water treatment; aluminum production; textile processing; cleaning preparations; petroleum refining; sealing ponds from leakage (sodium ions bind to clay particles which swell to seal leaks).

soda, baking. See sodium bicarbonate.

soda, calcined. See soda ash.

soda, caustic. See sodium hydroxide.

soda, crystals. See sodium carbonate monohydrate.

soda lime. A mixture of calcium oxide with sodium or potassium hydroxide intended for the absorption of carbon dioxide gas and water vapor.

Properties: White or grayish white granules unless colored by a specified indicator. Must be kept in air-tight containers.

Grades: Technical; reagent. Usually % moisture and mesh size are stated.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue.

Uses: Drying agent and carbon dioxide absorbent; laboratory reagent.

Shipping regulations: (Air) Corrosive label.

soda lime glass. See glass.

sodamide. See sodium amide.

soda, modified (neutral soda). A combination of soda ash and bicarbonate of soda in definite proportions for purposes where an alkali is needed ranging in causticity between bicarbonate of soda and soda ash. White crystalline powders, water-soluble and possessing valuable cleansing and purifying properties. Prepared in various strengths.

Containers: See soda ash.

Uses: Washing powders; laundering; wool scouring powders; bottle cleansers; textile cleaners; mild detergents.

soda monohydrate. See sodium carbonate, monohydrate.

soda, natural. See trona.

soda niter. See sodium nitrate.

"Sodaphos."⁵⁵ Trademark for glassy sodium tetraphosphate (q.v.).

soda pulp. See pulp, paper.

soda, washing. See sal soda.

alpha-sodio-sodium acetate (sodium alpha-sodio-acetate) $\text{NaCH}_3\text{COONa}$.

Properties: Free-flowing powder; stable in dry air; decomposes slowly in moist air. Decomposes 280°C without melting. Insoluble in ethers and hydrocarbons; reacts mildly with water.

Grade: 80–85% pure. Impurities are sodium acetate, sodium amide and sodium hydroxide.

Hazard: Irritant to skin and mucous membranes. Toxic by inhalation.

Uses: Organic intermediate; drying agent for organic solvents.

"Sodite."²⁵³ Trademark for an insecticide containing arsenic trioxide.

Hazard: Highly toxic.

sodium (natrium). Na Metallic element; atomic number 11; group IA of Periodic Table. Atomic weight 22.9898; valence 1; no stable isotopes, but several radioactive forms. Extremely reactive.

Properties: Soft, silver-white solid, oxidizing rapidly in air; wax-like at room temperature, brittle at low temperatures. Store in air-tight containers or in naphtha or similar liquid that does not contain water or free oxygen. Sp. gr. (25°C) 0.9674; m.p. 97.6°C; b.p. 892°C. Decomposes water on contact with evolution of hydrogen to form sodium hydroxide; insoluble in benzene, kerosine, and naphtha. Has excellent electrical conductivity.

Derivation: Electrolysis of a fused mixture of sodium chloride and calcium chloride in a Downs cell; a Castner cell may be used, but is less efficient.

Method of purification: Distillation.

Grades: Commercial; technical; brick, amalgam; coated powders; dispersions (see sodium dispersion); reactor (99.99% pure).

Hazard: Strong, caustic irritant to tissue. Severe fire risk in contact with water in any form. Ignites spontaneously in dry air when heated. To extinguish fires use dry soda ash, salt, or lime. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Tetraethyl and tetramethyl lead; titanium reduction; sodium peroxide; sodium hydride; polymerization catalyst for synthetic rubber; laboratory reagent; coolant in nuclear reactors; electric power cable (encased in polyethylene); non-glare lighting for highways; radioactive forms in tracer studies and medicine.

Shipping regulations: (Rail) Yellow label. (Air) Flammable solid label. Not accepted on passenger planes.

sodium abietate (rosin soap; sodium resinate)

$C_{19}H_{29}COONa$.

Properties: White powder. Soluble in water. Combustible.

Derivation: By leaching rosin with sodium hydroxide solution.

Uses: Medicine; soap making; paper coating.

sodium acetate (a) $NaC_2H_3O_2$; (b) $NaC_2H_3O_2 \cdot 3H_2O$.

Properties: Colorless, odorless crystals; efflorescent; soluble in water; slightly soluble in alcohol; soluble in ether. (a) Sp. gr. 1.528; m.p. 324°C; (b) sp. gr. 1.45; m.p. 58°C. Combustible. Low toxicity. Autoignition temp. 1125°F.

Grades: Highest purity; pure fused; C.P.; N.F.; technical; F.C.C.

Containers: Bags; drums.

Uses: Dye and color intermediate; pharmaceuticals; cinnamic acid; soaps; photography; purification of glucose; meat preservation; medicine; electroplating; tanning; dehydrating agent; buffer in foods; laboratory reagent.

sodium acetazolamide $C_4H_5N_4NaO_5S_2$.

Properties: Soluble in water; solution (1 in 10) has a pH range 9.0-10.0.

Grade: U.S.P.

Use: Medicine.

sodium N-acetoacetyl-para-sulfanilate

$CH_3COCH_2CONHC_6H_4SO_3Na$.

Properties: Available in the form of a red-colored 40% aqueous solution. Sp. gr. 1.203.

sodium acetone bisulfite (acetone-sodium bisulfite) $(CH_3)_2CONaHSO_3$.

Properties: Crystalline material; soluble in water; decomposed by acids; slightly soluble in alcohol. Combustible.

Derivation: Interaction of sodium bisulfite and acetone.

Uses: Chemical (pure acetone); photography; textile (dyeing and printing).

sodium acetylformate. See sodium pyruvate.

sodium acid carbonate. See sodium bicarbonate.

sodium acid methanearsonate. See sodium methanearsonate.

sodium acid phosphate. See sodium phosphate, monobasic.

sodium acid pyrophosphate. See sodium pyrophosphate, acid.

sodium acid sulfate. See sodium bisulfate.

sodium acid sulfite. See sodium bisulfite.

sodium acid tartrate. See sodium bitartrate.

sodium alginate (sodium polymannuronate) $(C_6H_7O_6Na)$.

Properties: Colorless or slightly yellow solid occurring in filamentous, granular, and powdered forms. Forms a viscous colloidal solution with water; insoluble in alcohol, ether, and chloroform. Nontoxic; combustible.

Derivation: Extracted from brown seaweeds (see alginic acid).

Grades: N.F.; F.C.C.; technical.

Uses: Thickeners, stabilizers and emulsifiers in foods, especially ice cream; boiler compounds; medicine; experimental ocean-floor covering; textile printing; cement compositions; paper coating; food and pharmaceutical preparations; water-base paints.

sodium alkane sulfonate (SAS). RSO_3Na . The sodium salt of an alkane sulfonic acid of linear paraffins having chain lengths of from 14 to 18 carbon atoms. Preparation: By reaction of paraffins with sulfur dioxide and oxygen in the presence of gamma radiation from a cobalt-60 source.

Use: Biodegradable detergent intermediate.

sodium alum. See aluminum sodium sulfate.

sodium aluminate $Na_2Al_2O_4$ or $NaAlO_2$.

Properties: White powder. Soluble in water; insoluble in alcohol; aqueous solution strongly alkaline. M.p. 1800°C.

Derivation: By heating bauxite with sodium carbonate and extracting the sodium aluminate with water. Grades: Technical; reagent; also 27° Bé solution.

Containers: Bags; multiwall paper sacks; drums.

Hazard: (solution) Toxic; strong irritant to tissue.

Uses: Mordant; zeolites; water purification; sizing paper; manufacture of milk-glass, soap and cleaning compounds.

Shipping regulations (solution): (Rail) White label. (Air) Corrosive label.

sodium aluminosilicate (sodium silicoaluminate). A series of hydrated sodium aluminum silicates having a $Na_2O:Al_2O_3:SiO_2$ mole ratio of approximately 1:1:13.2.

Properties: Fine, white, amorphous powder or beads. Odorless and tasteless; insoluble in water and in alcohol and other organic solvents, but at 80 to 100°C is partially soluble in strong acids and solutions of

alkali hydroxides; pH of a 20% slurry is between 6.5 and 10.5. Low toxicity. Noncombustible.

Grades: Technical; F.C.C.

Uses: Anti-caking agent in food preparations (up to 2%).

sodium aluminum hydride NaAlH_4 .

Properties: White crystalline material; sp. gr. 1.24. Stable in dry air at room temperature but very sensitive to moisture. Begins to melt at 183°C with decomposition to evolve hydrogen. Soluble in tetrahydrofuran, dimethyl "Cellosolve."

Derivation: By reaction of aluminum chloride with sodium hydride.

Containers: Glass bottles.

Hazard: Severe fire and explosion risk in contact with oxidizing agents and water; forms caustic and irritant compounds.

Use: Reducing agent similar to lithium aluminum hydride.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

sodium aluminum phosphate (sodium aluminum phosphate, acidic) $\text{NaAl}_3\text{H}_{14}(\text{PO}_4)_8 \cdot 4\text{H}_2\text{O}$ or $\text{Na}_3\text{Al}_2\text{H}_{15}(\text{PO}_4)_8$.

Properties: White odorless powder; insoluble in water; soluble in hydrochloric acid. Low toxicity.

Grades: Technical; F.C.C.

Use: Food additive (baked products).

sodium aluminum silicofluoride $\text{Na}_5\text{Al}(\text{SiF}_6)_4$. Sodium aluminum fluosilicate.

Properties: White powder; somewhat soluble in cold water; corrosive to galvanized iron.

Hazard: Avoid prolonged skin contact. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Moth proofing and insecticides; also to obtain acid medium in dyebath.

sodium aluminum sulfate. See aluminum sodium sulfate.

sodium amalgam Na_xHg_y .

Properties: A silver-white, porous, crystalline mass, containing 2–10% of metallic sodium. Decomposes water.

Derivation: Mercury is heated to about 200°C and sodium, in small pieces, added slowly. Also formed at one stage of process for making chlorine and sodium hydroxide by mercury cell process.

Grades: 2, 3, 4, 5, 6, 7, 8, 9, 10, and 20%.

Containers: Glass bottles.

Hazard: Flammable, dangerous fire risk. Toxic.

Uses: Preparation of hydrogen; reduction of metal halogen compounds and organic compounds; reagent in analytical chemistry.

Shipping regulations: (Rail) Flammable solids, n.o.s., Yellow label. (Air) Flammable Solid label.

sodium amide (sodamide) NaNH_2 .

Properties: White crystalline powder with ammonia odor. Decomposes in water and hot alcohol. M.p. 210°C ; b.p. 400°C .

Derivation: Dry ammonia gas is passed over metallic sodium at 350°C .

Hazard: Flammable, dangerous fire risk.

Uses: Manufacture of sodium cyanide; organic synthesis; laboratory reagent.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

sodium para-aminobenzoate (PABA sodium)

$\text{NH}_2\text{C}_6\text{H}_4\text{COONa}$. Sodium salt of para-aminobenzoic acid.

Properties: Crystals; soluble in water; slightly soluble in alcohol; nearly insoluble in ether.

Use: Medicine.

sodium aminophenylarsonate. See sodium arsanilate.

sodium para-aminosalicylate (PAS sodium)

$\text{NaOOC}_6\text{H}_3(\text{OH})\text{NH}_2$.

Properties: White to pale yellow crystalline powder. Practically odorless, with sweet saline taste. Freely soluble in water; sparingly soluble in alcohol; very slightly soluble in ether and chloroform; 2% solution is clear and colorless and has pH 6.5 to 8.5. Solutions decompose slowly and darken in color.

Grade: U.S.P.

Containers: Drums.

Use: Medicine.

sodium ammonium hydrogen phosphate. See sodium ammonium phosphate.

sodium ammonium phosphate (microcosmic salt; sodium ammonium hydrogen phosphate; phosphorus salt) $\text{NaNH}_4\text{HPO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Transparent, colorless, odorless, efflorescent, monoclinic crystals. Gives off water and ammonia on heating, leaving NaPO_3 . Soluble in water, insoluble in alcohol. Sp. gr. 1.57; m.p. about 79°C with decomposition.

Derivation: Mixing solutions of sodium phosphate and ammonium chloride.

Grades: Granular; C.P.; technical.

Use: Analytical reagent.

sodium anilinearsonate. See sodium arsanilate.

sodium antimonate (antimony sodiate) NaSbO_3 . Other forms are sodium metaantimonate $2\text{NaSbO}_3 \cdot 7\text{H}_2\text{O}$ and sodium pyroantimonate $\text{Na}_2\text{H}_2\text{Sb}_2\text{O}_7 \cdot \text{H}_2\text{O}$.

Properties: White, granular powder; slightly soluble in water and alcohol. Insoluble in dilute alkalies, mineral acids, but soluble in tartaric acid. Noncombustible.

Grades: Technical; glassmakers' grade.

Hazard: Toxic by ingestion and inhalation. Tolerance, as Sb, 0.5 mg per cubic meter of air.

Uses: Opacifier in enamels, for cast iron and glass; ingredient of acid resisting sheet steel enamels; high-temperature oxidizing agent.

sodium antimony biscatechol-2,4-disulfonate. See stibophen.

sodium arsanilate (sodium anilinearsonate; sodium aminophenylarsonate) $\text{C}_6\text{H}_4\text{NH}_2(\text{AsO} \cdot \text{OH} \cdot \text{ONa})$, often with 1 or more H_2O .

Properties: White, crystalline, odorless powder; faint salty taste. Soluble in water; slightly soluble in alcohol.

Derivation: By dissolving arsanilic acid in sodium carbonate solution and crystallizing.

Grades: Technical; medicinal.

Hazard: Highly toxic by ingestion and inhalation. May cause blindness.

Uses: Medicine; veterinary medicine; organic synthesis.

Shipping regulations: (Rail, Air) Poison label.

sodium arsenate $\text{Na}_3\text{AsO}_4 \cdot 12\text{H}_2\text{O}$.

Properties: Clear, colorless crystals; mild alkaline taste. Soluble in water; slightly soluble in alcohol and glycerol; insoluble in ether. Sp. gr. 1.7593; m.p. 86°C .

Derivation: Reaction of arsenic trioxide and sodium nitrate.

Grades: Pure crystals; C.P.; technical (60% arsenic pentoxide).

Containers: Bottles; multiwall paper sacks; drums.

Hazard: Highly toxic by ingestion and inhalation.

Uses: Medicine; insecticides; dry colors; textiles (mordant and assist in dyeing and printing); other arsenates; germicide.

Shipping regulations: (Rail, Air) Poison label.

sodium arsenite (sodium metaarsenite) NaAsO_2 .

Properties: Grayish white powder, which absorbs carbon dioxide from the air. Soluble in water; slightly soluble in alcohol. Sp. gr. 1.87.

Derivation: Arsenic trioxide is dissolved in a solution of sodium carbonate or hydroxide and boiled.

Grades: Crude; pure; 75% arsenious oxide (94% soluble).

Hazard: Highly toxic by ingestion and inhalation.

Uses: Manufacture of arsenical soaps for taxidermists; antiseptic; dyeing; insecticides; hide preservation; herbicide.

Shipping regulations: (Rail, Air) Poison label.

sodium arsphenamine. See arsphenamine.

sodium ascorbate $\text{C}_6\text{H}_7\text{NaO}_6$. The sodium salt of ascorbic acid (q.v.).

sodium azide NaN_3 .

Properties: Colorless, hexagonal crystals; decomposes at about 300°C ; sp. gr. 1.846 (20°C); soluble in water and in liquid ammonia; slightly soluble in alcohol; insoluble in ether.

Hazard: Highly toxic. Severe explosion risk when shocked or heated.

Uses: Explosive; medicinals.

Shipping regulations: (Rail, Air) Poison label.

sodium bacitracin methylene disalicylate. See bacitracin methylene disalicylate.

sodium barbital (barbital, soluble) $\text{C}_8\text{H}_{11}\text{N}_2\text{NaO}_3$.

Properties: White powder, stable, odorless; bitter taste. Soluble in water (solution alkaline to litmus); slightly soluble in alcohol; insoluble in ether.

Hazard: Toxic by ingestion. See barbiturate.

Use: Medicine.

sodium barbiturate $\text{C}_4\text{H}_3\text{N}_2\text{O}_3\text{Na}$.

Properties: White to yellow tinted powder; pH of a 1% aqueous solution 10.5. Soluble in water and dilute mineral acid.

Containers: Fiber drums.

Hazard: Toxic by ingestion. See barbiturate.

Uses: Synthetic intermediate; catalyst in ammonium nitrate propellants; wood impregnating solutions.

sodium benzenesulfonchloramine. See chloramine-B.

sodium benzoate $\text{C}_6\text{H}_5\text{COONa}$.

Properties: White, crystalline or granular, odorless powder; sweetish, astringent taste. Soluble in water and alcohol. Combustible. Low toxicity.

Derivation: Benzoic acid is neutralized with sodium bicarbonate solution, the solution filtered, concentrated and allowed to crystallize.

Grades: U.S.P.; F.C.C.; technical.

Containers: Cartons; bottles; boxes; drums.

Hazard: Use in foods limited to 0.1%.

Uses: Food preservative; antiseptic; medicine; tobacco; pharmaceutical preparations; intermediate for manufacture of dyes; rust and mildew inhibitor.

sodium benzosulfimide. See saccharin.

sodium benzylpenicillin. See penicillin.

sodium benzyl succinate $\text{C}_6\text{H}_5\text{CH}_2\text{O}_2\text{C}(\text{CH}_2)_2\text{COONa}$.

Properties: White amorphous or crystalline powder having a slight benzyl odor and cool salty taste. Soluble in hot and cold water.

sodium beryllium fluoride. See beryllium sodium fluoride.

sodium bicarbonate (baking soda; sodium acid carbonate) NaHCO_3 .

Properties: White powder or crystalline lumps; cooling, slightly alkaline taste. Soluble in water; insoluble in alcohol. Stable in dry air, but slowly decomposes in moist air. Sp. gr. 2.159; m.p. loses carbon dioxide at 270°C . Low toxicity. Noncombustible.

Derivation: Principally, by treating a saturated solution of soda ash with carbon dioxide to precipitate the less soluble bicarbonate; also by purifying the crude product from the Solvay process.

Grades: Commercial; pure; highest purity; C.P.; U.S.P.; F.C.C.

Containers: Bottles and cartons; bags; drums; bulk.

Uses: Manufacture of effervescent salts and beverages, artificial mineral water, baking powder; other sodium salts; pharmaceuticals; sponge rubber; gold and platinum plating; treating wool and silk; fire extinguishers; ceramics; prevention of timber mold; laboratory reagent; antacid; mouthwash.

sodium bichromate. See sodium dichromate.

sodium bifluoride (sodium acid fluoride) NaHF_2 .

Properties: White, crystalline powder. Soluble in water. Decomposed on heating. Sp. gr. 2.08.

Hazard: Highly toxic; strong irritant to tissue. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Tin plate production; neutralizer in laundry rinsing operations; preservative for zoological and anatomical specimens; etching glass; antiseptic.

Shipping regulations: (Air) (solid) Poison label; (solution) Corrosive label. (Rail) Not listed.

sodium biphosphate. See sodium phosphate, monobasic.

sodium bis(2-methoxyethoxy)-aluminumhydride. An organometallic metal hydride, the alkoxy adduct of sodium aluminum hydride; soluble in benzene and other hydrocarbons. Reacts less strongly with water than lithium aluminum hydride. Used for reduction of organic compounds.

sodium bismuthate NaBiO_3 .

Properties: Yellow or brown, amorphous powder. Slightly hygroscopic. Insoluble in cold water; decomposes in hot water and acids. Low toxicity.

Uses: Analysis (testing for manganese in iron, steel and ores); reagent; pharmaceuticals.

sodium bisulfate (sodium acid sulfate; niter cake; sodium hydrogen sulfate) (a) NaHSO_4 or (b) $\text{NaHSO}_4 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals or white, fused lumps; aqueous solution is strongly acid. Soluble in water. (a) Sp. gr. 2.435 (13°C); m.p. $>315^\circ\text{C}$. (b) Sp. gr. 2.103 (13°C); m.p. 58.5°C . Noncombustible.

Derivation: A by-product in the manufacture of hydrochloric and nitric acids.

Method of purification: Recrystallization.

Grades: Pure crystals; pure fused; pure dry; reagent; crude; C.P.; technical; F.C.C.

Forms available: Cakes; powder; prills; pearls.

Containers: Various sizes of drums; bulk in cars.

Hazard: Strong irritant to tissue.

Uses: Flux for decomposing minerals; substitute for sulfuric acid in dyeing; disinfectant; manufacture of sodium hydrosulfide, sodium sulfate and soda alum; liberating carbon dioxide in CO_2 baths; in thermophores; carbonizing wool; manufacture of magnesia cements, paper, soap, perfumes; foods; industrial cleaners; metal pickling compounds; laboratory reagent.

Shipping regulations: (Air) (solid and solution) Corrosive label. (Rail) Not listed.

sodium bisulfite (sodium acid sulfite; sodium hydrogen sulfite). NaHSO_3 .

Properties: White crystals or crystalline powder; slight sulfurous odor and taste; soluble in water; insoluble in alcohol. Unstable in air. Sp. gr. 1.48; m.p. decomposes. Low toxicity. Noncombustible.

Derivation: Sodium carbonate solution is saturated with sulfur dioxide gas and the solution crystallized.

Grades: Crystals; pure dry; commercial dry; reagent; commercial solution 35% Be; powder (67% SO_2); C.P.; U.S.P.; F.C.C.

Hazard: Not permitted in meats or other sources of vitamin B₁. Strong irritant to skin and tissue.

Uses: Chemicals (sodium salts, cream of tartar); dyes; intermediates; organic chemicals; perfumery; wood pulp (digestion); leather (depilatory, tanning); textiles (antichlor, mordant, discharge); food preservative; photographic reducing agent; fermentation industries; medicine; glucose and sugar syrups; brewing (cask sterilization); copper and brass plating; color preservative for pale crepe rubber; general antiseptic; analytical reagent; pesticides; source of sulfur dioxide.

Shipping regulations: (Air) Corrosive label. (Rail) Not listed.

sodium bitartrate (acid sodium tartrate) $\text{NaHC}_4\text{H}_5\text{O}_6 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline powder. Soluble in water (aqueous solution is acid); slightly soluble in alcohol. M.p., loses H_2O at 100°C ; b.p. 219°C (decomposes). Low toxicity. Combustible.

Grades: C.P.; technical; reagent.

Uses: Analysis (testing for potassium); effervescing mixtures.

sodium bithionolate (USAN) (thiobis[4,6-dichloro-ortho-phenylene]oxy] disodium; disodium 2,2'-thiobis-(4,6-dichlorophenoxide)) $\text{C}_{12}\text{H}_4\text{Cl}_4\text{Na}_2\text{O}_2\text{S}$.

Properties: Solid; soluble in water.

Uses: Medicine; in self-sanitizing polishes, waxes and cleaners; in shoe polish and leather conditioners.

sodium borate (sodium tetraborate; sodium borate (2,4,7); sodium pyroborate; borax) $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$. See also borax, anhydrous; borax, pentahydrate.

Properties: White crystals or powder; odorless; sp. gr. 1.73 ($20/4^\circ\text{C}$); loss of water of crystallization when heated, with melting, between 75 and 320°C ; fuses to a glassy mass at red heat (borax glass); effloresces slightly in warm, dry air. Soluble in water and glycerol; insoluble in alcohol. Low toxicity, noncombustible.

Derivation: Fractional crystallization from Searles Lake brine; solution of kernite ore followed by crystallization. Also from colemanite, natural borax, ulexite, and other borates.

Grades: Crystal; granulated; powdered (refined, U.S.P.); C.P.; technical.

Containers: Barrels; bulk (granulated); kegs; bags.

Uses: Heat-resistant glass; porcelain enamel; starch

and adhesives; detergents; herbicides; fertilizers; rust inhibitors; pharmaceuticals; leather; photography; bleaches; paint; boron compounds; flux for smelting; antifreeze; adhesives; insulation materials; laboratory reagent.

sodium borate, anhydrous. See borax, anhydrous.

sodium borate perhydrate $\text{NaBO}_2 \cdot \text{H}_2\text{O}_2 \cdot 3\text{H}_2\text{O}$.

Properties: Free-flowing, white powder. Dissolves readily in water to produce mildly alkaline peroxide solution. M.p. 63°C ; b.p., loses H_2O at 130 – 150°C .

Containers: 125-lb fiber drums.

Hazard: Oxidizing agent; fire risk near organic materials.

Uses: Dentrifices; hair wave preparations; bleaching; oxidation of dyestuffs; stain remover for plastic dishes.

See also sodium perborate.

sodium boroformate $\text{NaH}_2\text{BO}_3 \cdot 2\text{HCOOH} \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline solid. Soluble in water; m.p. 110°C .

Uses: Buffering agent toward both acid and alkali in the range of pH 8.5; textile treating and tanning baths.

sodium borohydride NaBH_4 .

Properties: White crystalline powder; soluble in water, ammonia, amines, pyridine, and dimethyl ether of diethylene glycol; insoluble in other ethers, hydrocarbons and alkyl chlorides. Sp. gr. 1.07; hygroscopic; stable in dry air to 300°C ; decomposes slowly in moist air or in vacuum at 400°C .

Derivation: By reaction of sodium hydride and trimethyl borate.

Grades: Technical; powdered; pellets.

Containers: Glass bottles; polyethylene bags in metal containers.

Hazard: Reacts with water to evolve hydrogen and sodium hydroxide. Flammable, dangerous fire risk. Store out of contact with moisture.

Uses: Source of hydrogen and other borohydrides. Reduces aldehydes, ketones and acid chlorides; bleaching wood pulp; blowing agent for plastics; precipitation of mercury from waste effluent (by reduction); decolorizer for plasticizers; recycling of gold and Pt group metals.

Shipping regulations: (Air) Flammable Solid label. (Rail) Not listed.

sodium bromate NaBrO_3 .

Properties: White odorless crystals or powder. Soluble in water; insoluble in alcohol. Sp. gr. 3.339; m.p. 381°C (dec.).

Derivation: By passing bromine into a solution of sodium carbonate, sodium bromide and sodium bromate being formed.

Hazard: Moderately toxic. Oxidizing material. Dangerous fire risk near organic materials.

Use: Analytical reagent.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

sodium bromide (a) NaBr , (b) $\text{NaBr} \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder or granules; saline and somewhat bitter taste; absorbs moisture from the air, becoming very hard. Soluble in water; moderately soluble in alcohol. Sp. gr. (a) 3.208, (b) 2.176; m.p. (a) 757.7°C ; b.p. 1390°C .

Derivation: Occurs naturally in some salt deposits. Made synthetically by first causing iron to react with bromine and water. The resulting ferrous-ferri bromide is dissolved in water, sodium carbonate added, the solution filtered and evaporated.

Grades: C.P.; crystalline; powdered; commercial; pure; highest purity; N.F.

Containers: Bottles; boxes; barrels; drums.

Hazard: Moderately toxic by inhalation and ingestion.

Uses: Photography; medicine; preparation of bromides; organic chemicals; source of bromine.

sodium bromite NaBrO_2 . Used as a desizing compound for textiles.

sodium cacodylate (sodium dimethylarsenate)

$(\text{CH}_3)_2\text{AsOONa} \cdot 3\text{H}_2\text{O}$.

Properties: White, amorphous crystals or powder; deliquescent. Melts about 60°C . Loses H_2O at 120°C . Soluble in water and alcohol.

Derivation: Oxidation and neutralization of cacodyl oxide.

Hazard: Highly toxic by inhalation and ingestion.

Uses: Medicine; herbicide.

Shipping regulations: (Solid) (Rail, Air) Poison label.

sodium carbolate. See sodium phenate.

sodium carbonate (soda). See soda ash; sal soda; sodium bicarbonate; sodium carbonate, monohydrate; sodium sesquicarbonate.

sodium carbonate, monohydrate (crystal, carbonate; soda monohydrate; soda crystals) $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$.

Properties: White; odorless; small crystals or crystalline powder; alkaline taste; sp. gr. 1.55. Soluble in water and glycerol; insoluble in alcohol. M.p. 109°C (loses water), 851°C . Noncombustible. Low toxicity.

Grades: U.S.P.; technical; F.C.C.

Uses: Medicine; photography; cleaning and boiler compounds; pH control of water; food additive.

sodium carbonate peroxide $2\text{Na}_2\text{CO}_3 \cdot 3\text{H}_2\text{O}_2$ or $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}_2 \cdot \frac{1}{2}\text{H}_2\text{O}$.

Properties: White crystalline powder. Soluble in water. Stable at room temperature when dry; decomposes rapidly at 100°C , evolving oxygen. Active oxygen content 14% min.

Derivation: Crystallization from solution of soda ash and hydrogen peroxide.

Grade: Technical.

Containers: 100-lb fiber drums.

Hazard: Oxidizing agent; dangerous near organic materials.

Uses: Source of hydrogen peroxide; household detergents; dental cleansers; bleaching and dyeing; modification of starch.

Shipping regulations: (Rail) Oxidizing materials, n.o.s., Yellow label. (Air) Oxidizer label.

sodium carboxymethylcellulose. See carboxymethylcellulose.

sodium caseinate.

Properties: White, coarse powder. Odorless, tasteless. Contains 65% proteins. Soluble in water (usually with turbidity).

Derivation: By dissolving casein in sodium hydroxide and evaporating.

Grades: Edible.

Uses: Medicine; foods; as emulsifier and stabilizer.

sodium catechol disulfonate. See disodium 1,2-dihydroxybenzene-3,5-disulfonate.

sodium cellulosate.

Properties: A cellulosic fiber.

Derivation: Reaction of sodium methoxide with cotton or rayon swollen in methyl alcohol.

Uses: Intermediate in preparing grafted fibers when combined with polyacrylonitrile; there is an average substitution of one polyacrylonitrile chain for every 100 to 300 anhydroglucose units of the cellulose.

sodium chlorate NaClO_3 .

Properties: Colorless, odorless crystals; cooling, saline taste; must not be triturated with any combustible substance. Soluble in water and alcohol. Sp. gr. 2.490; m.p. 255°C ; b.p., decomposes.

Derivation: A concentrated acid solution of sodium chloride is heated and electrolyzed, the chlorate crystallizing out.

Grades: Technical; C.P.; crystals; powder.

Containers: Drums; stainless steel tank cars.

Hazard: Dangerous fire risk; strong oxidant; contact with organic materials may cause fire. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Oxidizing agent and bleach (especially to make chlorine dioxide) for paper pulps; ore processing; herbicide and defoliant; medicine; substitute for potassium chlorate, being more soluble in water; matches; explosives; flares and pyrotechnics; recovery of bromine from natural brines; leather tanning and finishing; textile mordant; to make perchlorates. Shipping regulations: (Rail)-Yellow label. (Air) Oxidizer label.

sodium chloraurate. See sodium gold chloride.

sodium chloride (table salt; sea salt; halite; rock salt) NaCl .

Properties: Colorless, transparent crystals or white crystalline powder; somewhat hygroscopic; soluble in water and glycerol; very slightly soluble in alcohol. Sp. gr. 2.165; m.p. 801°C ; b.p. 1413°C . Noncombustible; low toxicity. Essential in diet to maintain chloride balance in body.

Occurrence: Deposits in Central New York, Southern Michigan, Gulf Coast, Great Salt Lake, Newfoundland.

Derivation: (a) evaporation and crystallization of natural brines. (b) solar evaporation of sea water. (c) direct mining from underground or surface deposits.

Method of purification: Recrystallization.

Impurities: Sulfates; heavy metals; alkaline earths; magnesium salts; ammonium salts.

Grades: Highest purity medicinal, crystals; highest purity, dried; highest purity, fine powder; highest purity, fused; reagent; reagent, fused; sea evaporated; ground; microsize; powdered; table salt; rock salt; C.P.; U.S.P.; F.C.C.; single pure crystals.

Uses: Chemical (sodium hydroxide, soda ash, hydrochloric acid, chlorine, metallic sodium); ceramic glazes; metallurgy; curing of hides; food preservative; mineral waters; soap manufacture (salting out); home water softeners; highway deicing; regeneration of ion-exchange resins; photography; food seasoning; herbicide; fire extinguishing; nuclear reactors; mouthwash; medicine (heat exhaustion); salting out dyestuffs; supercooled solutions. Single crystals are used for spectroscopy, ultraviolet and infrared transmission.

See also fused salt.

sodium chlorite NaClO_2 .

Properties: White crystals or crystalline powder; slightly hygroscopic; soluble in water. M.p. $180-200^\circ\text{C}$ (dec).

Grades: Technical; reagent.

Containers: Drums.

Hazard: (Solid) Flammable; strong oxidizing agent; dangerous fire and moderate explosion risk; (solution) strong irritant to skin and tissue.

Uses: For improving taste and odor of potable water (as an oxidizing agent); bleaching agent for textiles, paper pulp, edible and inedible oils, shellacs, varnishes, waxes and straw products; oxidizing agent; reagent.

Shipping regulations: (Solid) (Rail) Yellow label. (Air) Oxidizer label. Not acceptable on passenger planes. (Solution not over 42%) (Rail) White label. (Solution not over 40%) (Air) Corrosive label. (Solution over 40%) Not acceptable.

sodium chloroacetate $\text{ClCH}_2\text{COONa}$.

Properties: White nonhygroscopic powder, odorless, easier to handle than chloroacetic acid. Soluble in water; slightly soluble in methanol; insoluble in acetone; benzene, ether, and carbon tetrachloride. Low toxicity. Noncombustible.

Uses: Manufacture of weed killers, dyes, vitamins, pharmaceuticals; also a defoliant.

sodium chloroaurate. See sodium gold chloride.

sodium para-chloro-meta-cresolate. A water-soluble preservative for cutting oils.

sodium 4-chlorophthalate (monosodium 4-chlorophthalate) $\text{ClC}_6\text{H}_3(\text{COOH})\text{COONa}$.

Properties: White to light gray powder.

Grade: Commercial.

Containers: Fiber drums.

Use: Modifying agent in the manufacture of phthalocyanine pigments.

sodium chloroplatinate (platinic sodium chloride; platinum sodium chloride; sodium platinichloride) $\text{Na}_2\text{PtCl}_6 \cdot 4\text{H}_2\text{O}$.

Properties: Yellow powder; soluble in alcohol, water. Low toxicity; noncombustible.

Grades: Technical; C.P.

Containers: Glass bottles.

Uses: Etching on zinc; ink (indelible); microscopy; mirrors; medicine; photography; plating; catalyst; determination of potassium.

sodium ortho-chlorotoluene-para-sulfonate

$\text{NaSO}_3\text{C}_6\text{H}_3(\text{CH}_3)\text{Cl}$.

Properties: Gray to light tan powder; soluble in water and organic solvents.

Derivation: Sulfonation of ortho-chlorotoluene, neutralized to form the sodium salt.

Uses: Synthesis of dyes, intermediates and drugs.

sodium chromate $\text{Na}_2\text{CrO}_4 \cdot 10\text{H}_2\text{O}$.

Properties: Yellow, translucent, efflorescent crystals. Soluble in water; slightly soluble in alcohol. Sp. gr. 1.483; m.p. 19.92°C . Anhydrous sodium chromate is also available commercially.

Derivation: Chrome iron ore is melted in a reverberatory furnace with lime and soda, in presence of air. The melt is dissolved in water, a small amount of sodium carbonate added, the solution decanted, acidified with acetic acid, concentrated and crystallized.

Grades: Pure neutral; highest purity; technical; C.P.; reagent.

Containers: Bottles; drums; barrels.

Uses: Inks; dyeing; paint pigment; leather tanning; other chromates; protection of iron against corrosion; wood preservative.

sodium chromate, tetrahydrate $\text{Na}_2\text{CrO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Yellow crystals; deliquescent; soluble in water.

Grade: Technical.

Containers: Multiwall paper bags, 100 lb net; fiber drums.

Uses: Pigment manufacture; corrosion inhibition; leather tanning; other chromium compounds.

sodium citrate (trisodium citrate) $\text{C}_6\text{H}_5\text{O}_7\text{Na}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals or granular powder; odorless; stable in air; pleasant acid taste. Soluble in water; insoluble in alcohol. M.p. loses $2\text{H}_2\text{O}$ at 150°C ; b.p. decomposes at red heat. Combustible; nontoxic.

Derivation: Sodium sulfate solution is treated with calcium citrate, filtered, concentrated and crystallized.

Grades: Highest purity, medicinal; pure; commercial; C.P.; U.S.P.; F.C.C.

Containers: Bottles; drums; bags.

Uses: Medicine; soft drinks; photography; frozen desserts; meat products; detergents; special cheeses; electroplating; sequestrant and buffer; nutrient for cultured buttermilk; removal of sulfur dioxide from smelter waste gases; blood anticoagulant.

sodium copper chloride. See copper sodium chloride.

sodium copper cyanide (copper sodium cyanide; sodium cyanocuprate) $\text{NaCu}(\text{CN})_2$.

Properties: White, crystalline, double salt of copper cyanide and sodium cyanide. Sp. gr. 1.013 (20°C); decomposes at 100°C . Soluble in water.

Containers: 100-lb drums.

Hazard: Tolerance (as CN), 5 mg per cubic meter of air.

Use: For preparing and maintaining cyanide copper plating baths based on sodium cyanide.

sodium cyanate NaOCN .

Properties: White crystalline powder; soluble in water; insoluble in alcohol and ether. Sp. gr. 1.937 (20°C); m.p. 700°C .

Containers: Fiber drums; bottles.

Uses: Organic synthesis; heat treating of steel; intermediate for manufacture of medicinals; treatment of sickle cell anemia.

sodium cyanide NaCN .

Properties: White deliquescent, crystalline powder. Soluble in water; slightly soluble in alcohol; m.p. 563°C ; b.p. 149°C . The aqueous solution is strongly alkaline and decomposes rapidly on standing.

Derivation: By absorption of hydrocyanic acid in a solution of sodium hydroxide, with subsequent vacuum evaporation.

Grades: 30% solution; 73 to 75%; 96 to 98%; reagent; technical; briquettes granular.

Containers: 25-lb packages; 100-, 160-, 200-lb drums.

Hazard: Toxic by ingestion and inhalation. Tolerance (as CN), 5 mg per cubic meter of air. Safety data sheet available from manufacturing Chemists Assn., Washington, D.C.

Use: Extraction of gold and silver from ores; electroplating; heat treatment of metals; making hydrocyanic acid; insecticide; cleaning metals; fumigation; manufacture of dyes and pigments; nylon intermediates; chelating compounds; ore flotation.

Shipping regulations: (Rail, Air) Poison label.

sodium cyanoaurite. See sodium gold cyanide.

sodium cyanocuprate. See sodium copper cyanide.

sodium cyclamate (sodium cyclohexylsulfamate) $\text{C}_6\text{H}_{11}\text{NHSO}_3\text{Na}$.

Properties: White, crystalline, practically odorless powder; sweet taste. Freely soluble in water; practically insoluble in alcohol, benzene, chloroform and

ether; pH (10% solution) 5.5–7.5. Sweetening power approximately 30 times that of sucrose.

Grades: N.F.; F.C.C.

Containers: 100-lb drums.

Hazard: Claimed to cause cancer in laboratory animals. Prohibited by FDA for food use.

Use: Nonnutritive sweetener.

sodium decametaphosphate. See sodium metaphosphate.

sodium dehydroacetate $C_8H_7NaO_4 \cdot H_2O$.

Properties: Tasteless white powder. Soluble in water and propylene glycol. Insoluble in most organic solvents. See also dehydroacetic acid.

Grade: F.C.C.

Uses: Fungicide; plasticizer; toothpaste; pharmaceutical; preservative in food; mold inhibitor for strawberries and similar fruits.

sodium deoxycholate. See deoxycholic acid.

sodium dextran sulfate (dextran sulfate).

Properties: Solid; soluble in water.

Derivation: Derivatives of dextran (q.v.) having a molecular weight of 500 thousand to 2 million.

Uses: Fractionation and separation of biological preparations.

sodium 3,5-diacetamido-2,4,6-triiodobenzoate. See sodium diatrizoate.

sodium diacetate $CH_3COONa \cdot x(CH_3COOH)$, anhydrous, or $CH_3COONa \cdot x(CH_3COOH) \cdot yH_2O$, technical.

Properties: White crystals with an acetic acid odor; soluble in water; slightly soluble in alcohol; insoluble in ether. Decomposes above $150^\circ C$. Combustible. Low toxicity.

Containers: 5- to 250-lb drums.

Grade: F.C.C.

Uses: Buffer; mold inhibitor; souring agent; intermediate for acid salts; mordants, varnish hardeners; antitarnishing agents; sequestrant and preservative in foods.

sodium diatrizoate (sodium 3,5-diacetamido-2,4,6-triiodobenzoate) $C_6I_3(COONa)(NHCOCH_3)_2$.

Properties: White crystals; soluble in water. Solutions are radiopaque.

Grade: U.S.P. (as solution for injection).

Use: Radiopaque medium; medicine.

sodium 1-diazo-2-naphthol-4-sulfonate. See 1-diazo-2-naphthol-4-sulfonic acid.

sodium dibutylthiocarbamate. See "Tepidone."

sodium dibutyl naphthalene sulfonate. See "Sorbit" AC.

sodium alpha, beta-dichloroisobutyrate. A plant growth regulator.

sodium dichloroisocyanurate (sodium salt of dichloro-s-triazine-2,4,6-trione) $NaNC(O)NCIC(O)NCICO$.

Properties: White, slightly hygroscopic, crystalline powder; loose bulk density (approx.) powder 37 lb/cu ft, granulate 57 lb/cu ft. Active ingredient; approx 60% available chlorine; decomp. at $230^\circ C$.

Containers: 200-lb fiber drums.

Hazard: Strong oxidizing material; fire risk near organic materials. Toxic by ingestion.

Uses: Active ingredient in dry bleaches, dishwashing compounds, scouring powders; detergent-sanitizers,

swimming pool disinfectants, water and sewage treatment; replacement of calcium hypochlorite.

Shipping regulations: (Dry, containing more than 39% available chlorine) (Rail) Yellow label. (Air) Oxidizer label.

sodium 2,4-dichlorophenoxyacetate (2,4-D, sodium salt) $C_6H_3(OCH_2COONa)Cl_2$.

Properties: Crystalline solid. Decomposes at $215^\circ C$. Slightly soluble in water.

Hazard: Toxic and irritant by inhalation.

Use: Herbicide. See 2,4-D.

sodium 2,4-dichlorophenoxyethyl sulfate. See sesone.

sodium 2,2-dichloropropionate. See dalapon.

sodium dichromate (sodium bichromate). $Na_2Cr_2O_7 \cdot 2H_2O$.

Properties: Red or red-orange deliquescent crystals. Sp. gr. 2.52 ($13^\circ C$); m.p. $357^\circ C$; decomposes at $400^\circ C$; loses $2H_2O$ on prolonged heating at $100^\circ C$. Soluble in water; insoluble in alcohol. Noncombustible.

Derivation: (a) From chromite ore by alkaline roasting and subsequent leaching; (b) action of sulfuric acid on sodium chromate.

Grades: Technical crystalline; technical liquor containing 69–70% $Na_2Cr_2O_7 \cdot 2H_2O$; anhydrous.

Containers: Crystals; multiwall paper bags; fiber drums. Liquor: tank cars or tank trucks.

Hazard: Toxic by inhalation and ingestion; strong irritant. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Chemical reactant for oxidation reactions; chromic acid; corrosion inhibitor; manufacture of pigments; tanning of leather; electroplating; mordanting; defoliating agent; catalyst; wood preservative.

sodium diethyldithiocarbamate. $(C_2H_5)_2NCS_2Na$. Oxidation inhibitor in ethyl ether; in trace quantities it prevents peroxide formation.

sodium dihydrogen phosphate. See sodium phosphate, monobasic.

sodium dihydroxyethylglycine (N,N-bis(2-hydroxyethyl)-glycine) $NaOOCCH_2N(CH_2CH_2OH)_2$.

Properties: Clear straw-colored liquid; sp. gr. 1.204 ($25^\circ C$); f.p. below $-10^\circ C$.

Use: Complexing agent for the transition metals.

sodium dimethylarsenate. See sodium cacodylate.

sodium dimethyldithiocarbamate (SDDC)

$(CH_3)_2NCS_2Na$.

Properties: 40% solution is amber to light green; sp. gr. 1.17–1.20 ($25/25^\circ C$).

Derivation: Reaction of dimethylamine, carbon disulfide and sodium hydroxide.

Containers: 5-gal cans; 55-gal drums; tanks (solution).

Hazard: Moderately toxic.

Uses: Fungicide; corrosion inhibitor; rubber accelerator; intermediate; polymerization shortstop.

sodium dinitro-ortho-cresylate $CH_3C_6H_2(NO_2)_2ONa$.

Properties: Brilliant orange-yellow dye which may stain clothing and wood.

Derivation: By treating 4,6-dinitro-ortho-cresol with sodium hydroxide.

Hazard: Toxic by ingestion and inhalation.

Uses: Herbicide (control of mustard and other susceptible weeds); fungicide.

See also 4,6-dinitro-ortho-cresol.

sodium dioctyl sulfosuccinate. See dioctyl sodium sulfosuccinate.

sodium dioxide. NaO_2 . Exists as impurity (about 10%) in sodium peroxide; obtained by heating sodium peroxide in oxygen; reacts with water to yield hydrogen peroxide, oxygen, and sodium hydroxide.

sodium diphenylhydantoin (phenytoin, soluble)

$\text{C}_{15}\text{H}_{11}\text{N}_2\text{O}_2\text{Na}$. Sodium 5,5-diphenylhydantoinate.

Properties: White, odorless powder; freely soluble in water; soluble in alcohol; practically insoluble in ether and in chloroform; somewhat hygroscopic; on exposure to air diphenylhydantoin is liberated.

Containers: Up to 100-lb drums.

Grades: U.S.P.

Use: Medicine.

sodium dispersion. A stable suspension of microscopic sodium particles in a hydrocarbon or other medium boiling at temperatures above the melting point of sodium (97.5°C), e.g., heptane, n-octane, toluene, xylene, naphtha, kerosine, mineral oil, n-butyl ether, etc. Particles range in size from submicron to 30 microns depending on the method of preparation. Dispersions contain up to 50% (by weight) of sodium metal.

Hazard: Flammable, dangerous fire risk. To extinguish use soda ash, sodium chloride or graphite, followed by carbon dioxide. Do not use carbon tetrachloride.

Uses: For chemical reactions where advantages of controlled reaction rate, lower reaction temperature, increased yields, or substitution for more expensive reagent can be achieved; as, removal of sulfur from hydrocarbons and petroleum; metal powders; sodium hydride, alcohol-free alcoholates, phenylsodium.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

sodium dithionate (sodium hyposulfate) $\text{Na}_2\text{S}_2\text{O}_6 \cdot 2\text{H}_2\text{O}$.

Properties: Large transparent crystals; bitter taste. Soluble in water; insoluble in alcohol and concentrated hydrochloric acid. Sp. gr. 2.189 (25°C); loses $2\text{H}_2\text{O}$ at 110°C ; decomposes at 267°C . Combustible.

Use: Chemical reagent.

sodium dithionite (sodium hydrosulfite) $\text{Na}_2\text{S}_2\text{O}_4$ or $\text{Na}_2\text{S}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Light lemon-colored solid in powder or flake form; m.p. 55° (decomp.). Also available in liquid form. Soluble in water; insoluble in alcohol.

Derivation: (1) Zinc is dissolved in a solution of sodium bisulfite, the zinc-sodium sulfite precipitated by milk of lime leaving the hydrosulfite in solution. (2) Reaction of sodium formate with sodium hydroxide and sulfur dioxide.

Grades: Technical; reagent.

Containers: Drums; carlots; refrigerated tanks (liquid).

Hazard: Fire risk in contact with moisture. Strong reducing agent. Use dry sand, soda ash or carbon dioxide to extinguish fires.

Uses: Vat dyeing of fibers and textiles; stripping agent for dyes; reagent; bleaching sugar, soap, oils, minerals; oxygen scavenger for synthetic rubbers.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label.

sodium diuranate (uranium yellow) $\text{Na}_2\text{U}_2\text{O}_7 \cdot 6\text{H}_2\text{O}$.

Properties: Yellow-orange solid, insoluble in water; soluble in dilute acids.

Derivation: By treating a solution of uranyl salt with sodium hydroxide.

Hazard: Probably toxic.

Uses: Ceramics, to produce colored glazes; manufacture of fluorescent uranium glass.

sodium dodecylbenzenesulfonate $\text{C}_{12}\text{H}_{25}\text{C}_6\text{H}_4\text{SO}_3\text{Na}$.

Properties: White to light yellow flakes, granules, or powder; biodegradable. The dodecyl radical may have many isomers, and the benzene may be attached to it in many positions. Combustible.

Derivation: Benzene is alkylated with dodecene, to which it attaches itself in any secondary position; the resulting dodecylbenzene is sulfonated with sulfuric acid and neutralized with caustic soda. For ABS (branched-chain alkyl) the dodecene is usually a propylene tetramer, made by catalytic polymerization of propylene. For LAS (straight-chain alkyl), the dodecene may be removed from kerosine or crudes by molecular sieve, may be formed by Ziegler polymerization of ethylene, or by cracking wax paraffins to alpha-olefins. See also biodegradability; alkyl sulfonate, linear; detergent; alkylate (3).

Containers: Carlots.

Use: Most widely used synthetic detergent.

sodium dodecylphenyl oxide disulfonate

$\text{C}_{24}\text{H}_{34}\text{O}(\text{SO}_3)_2\text{Na}_2$. M.p. 150°C (dec); dry form 90% min active solution (45%), sp. gr. 1.1. Very soluble in water, strong acids, bases and electrolytes; stable to oxidation.

sodium erythorbate (sodium isoascorbate) $\text{NaC}_6\text{H}_7\text{O}_6$.

White, free-flowing crystals. Soluble in water.

Grades: Technical; F.C.C.

Uses: Antioxidant and preservative.

sodium ethoxide. See sodium ethylate.

sodium ethylate (sodium ethoxide; caustic alcohol) $\text{C}_2\text{H}_5\text{ONa}$.

Properties: White powder, sometimes having brownish tinge. Readily hydrolyzes to alcohol and sodium hydroxide.

Derivation: By carefully adding small amounts of sodium to absolute alcohol kept at a temperature of 10°C , heating carefully to 37.7°C , again carefully adding sodium, cooling to 10°C , and adding the same quantity of absolute alcohol as was used originally.

Hazard: See sodium hydroxide, which is formed when exposed to moisture.

Use: Organic synthesis.

sodium ethylenebisdithiocarbamate. See nabam.

sodium 2-ethylhexyl sulfoacetate

$\text{C}_8\text{H}_{17}\text{OOCCH}_2\text{SO}_3\text{Na}$.

Properties: Light cream-colored flakes; water-soluble. Good foaming properties and excellent resistance to hard water. Solutions practically neutral and stable to mineral acids. Low toxicity. Combustible.

Uses: Solubilizing agent, particularly for soapless shampoo compositions; electroplating detergent.

sodium ethylmercurithiosalicylate. See thimerosal.

sodium ethyl oxalacetate. See ethyl sodium oxalacetate.

sodium ethylxanthate (sodium xanthogenate; sodium xanthate) $\text{C}_2\text{H}_5\text{OC}(\text{S})\text{SNa}$. See also xanthic acids.

Properties: Yellowish powder; soluble in water, alcohol. Use: Ore flotation agent.

sodium ferricyanide (red prussiate of soda) $\text{Na}_3\text{Fe}(\text{CN})_6 \cdot \text{H}_2\text{O}$.

Properties: Ruby-red, deliquescent crystals. Soluble in water; insoluble in alcohol. Low toxicity.

Derivation: Chlorine is passed into sodium ferrocyanide solution.

Grades: Technical; C.P.

Uses: Production of pigments; dyeing; printing.

sodium ferrocyanide (yellow prussiate of soda)

$\text{Na}_4\text{Fe}(\text{CN})_6 \cdot 10\text{H}_2\text{O}$.

Properties: Yellow, semitransparent crystals. Soluble in water; insoluble in alcohol. Sp. gr. 1.458. Low toxicity.

Grades: Technical; F.C.C.

Containers: Bags.

Uses: Photography; manufacture of sodium ferricyanide; blue pigments; blueprint paper; metallurgy; tanning; dyes; anticaking agent for sodium chloride.

sodium fluoborate NaBF_4 .

Properties: White powder; bitter acid taste; slowly decomposed by heat; sp. gr. 2.47 (20°C); m.p. 384°C. Soluble in water; slightly soluble in alcohol.

Derivation: By heating sodium fluoride and hydrofluoboric acid and cooling slowly.

Uses: Sand casting of aluminum and magnesium; electrochemical processes; oxidatoin inhibitor; fluxes for nonferrous metals; fluorinating agent.

sodium fluophosphate. See sodium fluorophosphate.

sodium fluorescein. U.S.P. name for uranine.

sodium fluoride NaF .

Properties: Clear, lustrous crystals or white powder. Insecticide grade frequently dyed blue. Soluble in water; very slightly soluble in alcohol. Sp. gr. 2.558 (41°C); m.p. 988°C; b.p. 1695°C.

Derivation: By adding sodium carbonate to hydrofluoric acid.

Grades: Pure; C.P.; U.S.P.; insecticide; technical; single pure crystals.

Containers: 100-lb multiwall paper bags; 125-lb drums; 400-lb carlots.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Fluoridation of municipal water (1 ppm); treatment of steel; wood preservative; insecticide (not to be used on living plants); fungicide, and rodenticide; chemical cleaning; electroplating; glass manufacture; vitreous enamels; preservative for adhesives; toothpastes; single crystals used as windows in ultraviolet and infrared radiation detecting systems.

Shipping regulations: (solution) (Air) Corrosive label.

sodium fluoroacetate (also known as 1080)

FCH_2COONa .

Properties: Fine, white, odorless powder; soluble in water. Nonvolatile. Decomposes at 200°C; soluble in water; insoluble in most organic solvents.

Derivation: Ethyl chloroacetate and potassium fluoride form ethyl fluoroacetate, which is then treated with a methanol solution of sodium hydroxide.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air. For use by trained operators only.

Use: Rodenticide.

Shipping regulations: (Rail, Air) Not listed.

sodium fluorophosphate (sodium fluophosphate)

$\text{Na}_2\text{PO}_3\text{F}$.

Properties: Colorless crystals; m.p. 625°C (approx.); soluble in water.

Grade: 97%.

Hazard: Toxic; strong irritant.

Uses: Preparation of bactericides and fungicides.

sodium fluosilicate (sodium silicofluoride, sodium fluosilicate). Na_2SiF_6 .

Properties: White, odorless, tasteless, free-flowing powder; sp. gr. 2.7; m.p., decomposes at red heat; very slightly soluble in cold water; more soluble in hot water; insoluble in alcohol.

Derivation: From fluosilicic acid and sodium carbonate, or sodium chloride.

Grades: Technical; C.P.

Containers: Multiwall bags; fiber drums; various sized barrels.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Fluoridation of drinking water; laundry sours; opalescent glass; vitreous enamel frits; metallurgy of aluminum and beryllium; insecticides and rodenticides; chemical intermediate; glue, leather and wood preservative.

sodium formaldehyde bisulfite $\text{HOCH}_2\text{SO}_3\text{Na}$.

Properties: White water-soluble solid.

Derivation: Action of sodium bisulfite, formaldehyde and water.

Use: Textile stripping agent.

See also hydrosulfite-formaldehyde compounds.

sodium formaldehyde hydrosulfite. See hydrosulfite-formaldehyde compounds. Also used in synthetic rubber polymerization, and textile dyeing and stripping agent.

sodium formaldehyde sulfoxylate (sodium sulfoxylate; sodium sulfoxylate formaldehyde; SFS) $\text{HCHO} \cdot \text{HSO}_3\text{Na} \cdot 2\text{H}_2\text{O}$.

Properties: White solid; m.p. 64°C; soluble in water and alcohol.

Purity: Usually admixed with a sulfite.

Containers: Drums; truckloads.

Hazard: Probably toxic.

Uses: Stripping and discharge agent for textiles; bleaching agent for molasses, soap.

See also hydrosulfite-formaldehyde preparations.

sodium formate HCOONa .

Properties: White, slightly hygroscopic, crystalline powder, slight odor of formic acid; soluble in water; slightly soluble in alcohol; insoluble in ether. Sp. gr. 1.919; m.p. 253°C.

Derivation: Carbon monoxide and sodium hydroxide are heated under pressure; also from pentaerythritol manufacture.

Grades: Technical; C.P.

Containers: Bags; carlots.

Uses: Reducing agent; manufacture of formic acid and oxalic acid; organic chemicals; mordant; manufacture of sodium dithionite; complexing agent; analytical reagent.

sodium gentisate $\text{C}_6\text{H}_4\text{O}_4\text{Na}$. The sodium salt of gentisic acid.

Properties: Crystallizes with 5.5 H_2O from water; loses 3 H_2O rapidly upon exposure to air; soluble in water.

Use: Medicine.

sodium glucoheptonate $\text{HOCH}_2(\text{CHOH})_5\text{COONa}$.

Light tan crystalline powder. A sequestering agent for polyvalent metals.

Uses: Metal cleaning; bottle washing; kier boiling;

mercerizing; caustic boiloff; paint stripping; aluminum etching.

sodium gluconate $\text{NaC}_6\text{H}_{11}\text{O}_7$.

Properties: White to yellowish, crystalline powder; readily soluble in water; sparingly soluble in alcohol. Low toxicity.

Derivation: From glucose by fermentation.

Grades: Purified; technical; F.C.C.

Containers: Fiber drums; bags.

Use: Foods and pharmaceuticals; sequestering agent; metal cleaners; paint stripper; aluminum deoxidizer; bottle-washing preparations; rust removal.

sodium glucosulfone $\text{C}_{24}\text{H}_{34}\text{N}_2\text{Na}_2\text{O}_{18}\text{S}_3$, para'-diaminodiphenylsulfone- N,N' -di-(dextrose sodium sulfonate). The U.S.P. grade is an aqueous solution (for injection), clear and pale yellow; pH 5.0–6.5. Used in medicine.

sodium glutamate (monosodium glutamate; MSG) $\text{COOH}(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{COONa}$. Sodium salt of glutamic acid, one of the common naturally occurring amino acids.

Properties: White crystalline powder; m.p., decomposes; soluble in water and alcohol. Shows optical activity. Most effective between pH 6 and 8. Non-toxic.

Derivation: (a) Alkaline hydrolysis of the waste liquor from beet sugar refining; (b) a similar hydrolysis of wheat or corn gluten; (c) organic synthesis based on acrylonitrile.

Grades: Technical, 99%; N.D.; F.C.C.

Containers: Bottles, cans, fiber drums; retail shaker cans; paper bags; bulk.

Uses: Flavor enhancer for foods, in concentrations of about 0.3%. See also flavor; glutamic acid.

sodium glycolate (sodium hydroxyacetate)

$\text{NaOOCCH}_2\text{OH}$.

Properties: White powder.

Uses: Buffer in electroless plating and textile finishing.

sodium gold chloride (sodium aurichloride; sodium chloraurate; sodium chloroaurate; gold sodium chloride; gold salts) $\text{NaAuCl}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Yellow crystals; soluble in water and alcohol.

Derivation: By neutralizing chloroauric acid with sodium carbonate.

Uses: Photography; staining fine glass; decorating porcelain; medicine.

sodium gold cyanide (sodium cyanoaurite; sodium aurocyanide; gold sodium cyanide) $\text{NaAu}(\text{CN})_2$.

Properties: Yellow powder; soluble in water; contains 46% gold (min).

Hazard: Toxic. Tolerance (as CN), 5 mg per cubic meter of air.

Use: For gold-plating radar and electric parts, razor holders, lamps, clocks, jewelry and tableware.

sodium guanylate (GMP; disodium gyanylate)

$\text{Na}_2\text{C}_{10}\text{H}_{12}\text{N}_5\text{O}_8\text{P} \cdot 2\text{H}_2\text{O}$. A 5'-nucleotide. See also guanylic acid.

Properties: Crystals; soluble in cold water; very soluble in hot water.

Derivation: From a seaweed or from dried fish.

Use: Flavor potentiator in foods.

sodium gynocardate (sodium hydnocarbate). Sodium salt of the fatty acids in chaulmoogra oil.

Properties: Yellow powder. Soluble in alcohol, water. Aqueous solution slightly alkaline.

Use: Medicine.

sodium heparin. See heparin.

sodium heptametaphosphate. See sodium metaphosphate.

sodium hexachloroosmate (osmium-sodium chloride; sodium-osmium chloride) Na_2OsCl_6 .

Properties: Orange, rhombic prisms. Contains 40.3% osmium. Unstable. Soluble in alcohol, water.

Grade: Technical.

Use: Catalyst (oxidation).

sodium hexametaphosphate. See "Calgon."

sodium hexylene glycol monoborate $\text{C}_6\text{H}_{12}\text{O}_3\text{BNa}$.

Properties: Amorphous white solid; bulk density 0.25 g/cc; m.p. 426°C. Soluble in nonpolar solvents.

Purity: Minimum 98%.

Uses: Corrosion inhibitor in organic systems; additive to lubricating oils; flame-retardant; siloxane resin additive.

sodium hydnocarbate. See sodium gynocardate.

sodium hydrate. See sodium hydroxide.

sodium hydride NaH .

Properties: Practically odorless powder; sp. gr. 0.92; m.p. 800°C (dec). Must be kept cool and dry. Particle size range 5–50 μ . Starts to decompose with evolution of hydrogen at about 255°C.

Preparation: Reaction of sodium metal with hydrogen. A microcrystalline dispersion of gray powder in oil, concentration 50 or 25% by weight.

Containers: The dispersion is packed in polyethylene bags in a metal can. Packaging ranges from 1 pint to 55-gal drums.

Hazard: Dangerous fire risk. Reacts violently with water evolving hydrogen.

Uses: Condensing or alkylating agent, especially for amines; descaling metals.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

sodium hydrosulfide (sodium sulfhydrate) $\text{NaSH} \cdot 2\text{H}_2\text{O}$.

Properties: Colorless needles to lemon-colored flakes. Soluble in water, alcohol, and ether. 70–72% NaSH ;

m.p. 55°C; water of crystallization 26–28%.

Derivation: From calcium sulfide by treating it in the cold with sodium bisulfate.

Grades: Technical; flake, 70–72%; solution, 40–44%.

Containers: Drums; tank cars.

Hazard: Contact with acids causes evolution of toxic gases.

Uses: Paper pulping; dyestuffs processing; rayon and cellophane desulfurizing; unhairing hides; bleaching reagent.

sodium hydrosulfite. See sodium dithionite.

sodium hydroxide (caustic soda; sodium hydrate; lye; white caustic) NaOH . The most important commercial caustic. Sixth highest-volume chemical produced in U.S. (1975).

Properties: White deliquescent solid, now chiefly in form of beads or pellets; also 50% and 73% aqueous solution. Absorbs water and carbon dioxide from the air. Sp. gr. 2.13; m.p. 318°C; b.p. 1390°C. Soluble in water, alcohol, and glycerol.

Derivation: Electrolysis of sodium chloride (brines) (there are several variations).

Grades: Commercial; ground; flake; beads; F.C.C.; granulated (60% and 76% Na_2O); rayon (low in iron, copper, and manganese); purified by alcohol (sticks, lumps, and drops); reagent; highest purity: C.P., U.S.P.

Containers: U.S.P., C.P.: 1-lb bottles; 5-, 10-lb cans;

commercial; drums and barrels; solution; drums; tank trucks and cars; barges.

Hazard: Corrosive to tissue in presence of moisture; strong irritant to tissue (eyes, skin, mucous membranes). Tolerance, 2 mg per cubic meter of air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Chemical manufacture; rayon and cellophane; petroleum refining; pulp and paper; aluminum; detergents; soap; textile processing; vegetable oil refining; reclaiming rubber; regenerating ion exchange resins; organic fusions; peeling of fruits and vegetables in food industry; laboratory reagent; etching and electroplating.

Shipping regulations: (Rail) (solution) White label. (Air) (solid and solution) Corrosive label.

sodium hypochlorite $\text{NaOCl} \cdot 5\text{H}_2\text{O}$.

Properties: Unstable in air unless mixed with sodium hydroxide. Strong oxidizing agent, usually stored and used in solution; disagreeable, sweetish odor and pale greenish color. Soluble in cold water; decomposed by hot water. M.p. 18°C .

Derivation: Addition of chlorine to cold dilute solution of sodium hydroxide.

Grade: Technical.

Containers: Carboys; drums.

Hazard: Strong irritant to tissue. Fire risk in contact with organic materials.

Uses: Bleaching paper pulp, textiles, etc.; intermediate; organic chemicals; water purification; medicine; fungicides; swimming pools; household bleach; laundering; reagent.

Shipping regulations: (Rail) Hypochlorite solutions containing more than 7% available chlorine: White label. (Air) Hypochlorite solutions: Corrosive label.

sodium hypophosphite $\text{NaH}_2\text{PO}_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless, pearly, crystalline plates or white, granular powder; saline taste. Deliquescent. Soluble in water, partially in alcohol.

Derivation: By neutralizing hypophosphoric acid with sodium carbonate.

Grades: Technical; C.P.

Containers: Glass bottles; drums; car lots; truck loads.

Hazard: Explosion risk when mixed with strong oxidizing agents; decomposes to phosphine on heating. Store in cool, dry place, away from oxidizing materials.

Uses: Medicine; reducing agent in electroless nickel plating of plastics and metals; laboratory reagent.

Shipping regulations: Consult authorities.

sodium inosinate $\text{C}_{10}\text{H}_{11}\text{Na}_2\text{N}_4\text{O}_8\text{P}$. A 5'-nucleotide derived from seaweed or dried fish. Sodium guanylate (q.v.) is a byproduct.

Use: Flavor potentiator in foods.

See also inosinic acid.

sodium iodate NaIO_3 .

Properties: White crystals; sp. gr. 4.28. Soluble in water and acetone; insoluble in alcohol. Low toxicity.

Derivation: Interaction of sodium chlorate and iodine in presence of nitric acid.

Grades: C.P.; reagent; technical.

Hazard: Oxidizing agent; fire risk near organic materials.

Uses: Medicine; disinfectant; feed additive; reagent.

sodium iodide (a) NaI (b) $\text{NaI} \cdot 2\text{H}_2\text{O}$.

Properties: White cubical crystals or powder, or color-

less, odorless crystals; slowly becomes brown in air; deliquescent; saline, somewhat bitter taste. Soluble in water, alcohol, and glycerin. Sp. gr. (a) 3.665; (b) 2.448 (21°C). M.p. (a) 653°C ; b.p. (a) 1304°C .

Grades: Technical; C.P.; U.S.P.; single crystals.

Containers: 25-, 100-, 300-lb drums.

Hazard: Moderately toxic.

Uses: Photography; solvent for iodine; organic chemicals; reagent; medicine; feed additive; artificial rain-making; scintillation (thallium-activated form).

sodium iodide I 131 (sodium radio-iodide). A radioactive form of sodium iodide containing iodine 131 which can be used as a tracer. See iodine 131.

Grade: U.S.P. (as capsules or solution).

sodium iodipamide $\text{C}_{30}\text{H}_{12}\text{I}_6\text{N}_2\text{Na}_2\text{O}_6$. N,N'-adipolybis-(3-amino-2,4,6-triiodobenzoic acid) disodium salt.

Properties: Radiopaque; water-soluble. Available as a 20% solution for injection as a clear colorless to pale yellow, slightly viscous liquid.

Derivation: By dissolving the free acid in dilute sodium hydroxide and buffering to pH 6.5-7.7

Grade: U.S.P.

Use: X-ray contrast medium.

sodium iodomethanesulfonate. See sodium methiodal.

sodium iothalamate (sodium 5-acetamido-2,4,6-triiodo-N-methylisophthalamate) $\text{C}_6\text{I}_3(\text{CONHCH}_3)_2\text{COONa}$.

Grade: U.S.P. (as injection).

Use: Medicine (radiopaque medium).

sodium ipodate (USAN) (sodium 3-(dimethylamino-methyleneamino)-2,4,6-triiodohydrocinnamate) $\text{NaOOCCH}_2\text{CH}_2\text{C}_6\text{H}(\text{I}_3)\text{N}:\text{CHN}(\text{CH}_3)_2$.

Uses: Radiopaque agent in medicine.

sodium iron pyrophosphate (SIPP) $\text{Na}_8\text{Fe}_4(\text{P}_2\text{O}_7)_5 \cdot x\text{H}_2\text{O}$.

Properties: 300 Mesh powder; tan in color; insoluble in water but soluble in dilute acid. Minimum 14.5% iron. Iron is in complex form and will not catalyze oxidation reactions.

Derivations: By reacting tetrasodium pyrophosphate with a soluble iron salt.

Containers: Drums.

Use: For iron enrichment, particularly in flours and cereals.

sodium isoascorbate. See sodium erythorbate.

sodium isobutylxanthate $\text{CH}(\text{CH}_3)_2\text{CH}_2\text{OC}(\text{S})\text{Na}$. See xanthic acid.

Use: Ore flotation agent.

sodium isopropyl-naphthalenesulfonic acid. See "Vat-sol."

sodium isopropylxanthate $(\text{CH}_3)_2\text{CHOC}(\text{S})\text{Na}$.

Properties: Light-yellow crystals soluble in water; deliquescent; decomposes 150°C . Low toxicity.

Hazard: Irritant to skin and mucous membranes. Moderate fire risk.

Uses: Chemical weed killer of seeded crops; fortifying agent for certain oils; flotation reagent for base and precious metal ores.

sodium isovalerate. See sodium valerate.

sodium lactate $\text{CH}_3\text{CHOHCOONa}$.

Properties: Colorless or yellowish syrupy liquid, very hygroscopic. Soluble in water. M.p. 17°C ; decomposes 140°C . Combustible; low toxicity.

Grades: Technical; U.S.P. (solution with pH 6.0 to 7.3).

Uses: Medicine; hygroscopic agent; glycerin substitute; plasticizer; corrosion inhibitor in alcohol antifreeze.

sodium N-lauroyl sarcosinate $C_{15}H_{28}NO_4Na$. Available as 30% aqueous solution in 55-gal drums.

Uses: Dentrifices, hair shampoos, rug shampoos.

sodium lauryl sulfate $NaC_{12}H_{25}SO_4$.

Properties: Small, white or light yellow crystals; slight characteristic odor. Soluble in water, forming an opalescent solution. Low toxicity.

Grades: U.S.P.; technical; F.C.C.

Containers: 55-gal drums; tank cars.

Uses: Wetting agent in textiles; detergent in toothpaste; food additive and surfactant.

sodium lead alloy. One of several alloys, as follows:

(1) usually containing 10% sodium and 90% lead, used in the manufacture of lead tetraethyl; (2) containing 2% sodium used as a deoxidizer and homogenizer in nonferrous metals where lead is a component; (3) used as a stabilizer and deoxidizer for lead in cable sheathing.

Hazard: Toxic; moderate fire and explosion risk; reacts with moisture, acids, and oxidizing agents.

sodium lead hyposulfite. See lead sodium thiosulfate.

sodium lead thiosulfate. See lead sodium thiosulfate.

sodium lignosulfonate.

Properties: Tan, free-flowing spray-dried powder, containing 70–80% total lignin sulfonates, balance wood sugars. Combustible; low toxicity.

Containers: 50-lb bags.

Uses: Dispersant, emulsion stabilizer, chelating agent. See also lignin sulfonate.

sodium liothyronine

$NaOOCCH(NH_2)CH_2C_6H_4I_2OC_6H_4IOH$. Sodium L-3[4-(4-hydroxy-3-iodophenoxy)-3,5-diiodophenyl]-alanine.

Properties: Light-tan, odorless, crystalline powder. Very slightly soluble in water. Slightly soluble in alcohol, insoluble in most other organic solvents.

Grade: U.S.P.

Use: Medicine (a thyroid hormone).

sodium MBT ($NaMBT$) $C_7H_4NS_2Na$. A 50% aqueous solution of sodium mercaptobenzothiazole. Light-amber liquid; density 10.5 lb/gal.

Uses: Corrosion inhibitor for nonferrous metals; antifreeze, paper mill systems.

sodium mercaptoacetate. See sodium thioglycolate.

sodium 2-mercaptopbenzothiazole. See sodium MBT.

sodium metabisulfite (sodium pyrosulfite) $Na_2S_2O_5$.

Chief constituent of commercial dry sodium bisulfite, with which most of its properties and uses are practically identical.

Grade: F.C.C.

Uses: In foods, as preservative; laboratory reagent.

sodium metaborate $NaBO_2$.

Properties: White lumps; sp. gr. 2.464. Soluble in water. M.p. 966°C; b.p. 1434°C. Low toxicity. Noncombustible.

Derivation: By fusing sodium carbonate and borax.

Use: Herbicide.

Also available commercially as octahydrate and tetrahydrate.

sodium metanilate $NaSO_3C_6H_4NH_2$.

Derivation: The meta-sodium sulfonate of aniline

sold as a solid or 20% aqueous solution prepared by neutralizing metanilic acid.

Grades: Technical; 99%; also 20% solution.

Containers: Barrels; drums.

Use: Manufacture of synthetic dyestuffs and drugs.

sodium metaperiodate. See sodium periodate.

sodium metaphosphate ($NaPO_3$)_n, where *n* ranges from 3 to 10 (cyclic molecules) or may be a much larger number (polymers). Cyclic sodium metaphosphate, based on rings of alternating phosphorus and oxygen atoms, range from the trimetaphosphate, ($NaPO_3$)₃, to at least the decametaphosphate. So-called sodium hexametaphosphate is probably a polymer where *n* is between 10 and 20 (see "Calgon").

The vitreous sodium phosphates having a Na_2O/P_2O_5 mole ratio near unity are classified as sodium metaphosphates (Graham's salts). The average number of phosphorus atoms per molecule in these glasses ranges from about 25 to infinity. The term sodium metaphosphate has also been extended to short-chain vitreous compositions, the molecules of which exhibit the polyphosphate formula $Na_{n+2}P_nO_{3n+1}$ with *n* as low as 4–5. These materials are more correctly called sodium polyphosphates (q.v.).

Uses: Dental polishing agents; detergent builders; water softening; sequestrants; emulsifiers; food additives; textile processing; laundering.

sodium metasilicate, anhydrous. Na_2SiO_3 . A crystalline silicate.

Properties: Dustless white granules; m.p. 1089°C; total Na_2O content 51.5%; total Na_2O in active form 48.6%; density 2.61 or 75 lb/cu ft. Soluble in water; precipitated by acids and by alkaline earth and heavy metal ions; pH of 1% solution 12.6. Nontoxic; noncombustible.

Derivation: Crystallized from a melt of Na_2O and SiO_2 below 1089°C.

Containers: Bags; fiber drums; carlots.

Uses: Laundry, dairy and metal cleaning; floor cleaning; base for detergent formulations; bleaching aid; deinking paper.

Also available as the pentahydrate, whose properties are m.p. 72.2°C; total Na_2O content 29.3%; total Na_2O in active form 27.8%; density 1.75, or 55 lb per cu ft.

sodium metavanadate $NaVO_3$, often with $4H_2O$.

Properties: Colorless, monoclinic, prismatic crystals, or pale green crystalline powder. Soluble in water. M.p. 630°C. Noncombustible; low toxicity.

Derivation: Sodium hydrate and vanadium pentoxide in water solution.

Grades: Technical; C.P.

Containers: Glass bottles; fiber drums.

Uses: Inks; fur dyeing; photography; inoculation of plant life; mordants and fixers; corrosion inhibitor in gas-scrubbing systems.

sodium methacrylate $CH_2=C(CH_3)COONa$.

Properties: Water-soluble monomer.

Containers: Drums.

Uses: Resins; chemical intermediate.

sodium methanearsonate.

(1) See disodium methylarsonate.

(2) (monosodium methanearsonate; sodium acid methanearsonate; sodium methylarsonate) $CH_3AsO(OH)(ONa)$.

Properties: White solid; m.p. 130–140°C; very soluble in water.

Hazard: Highly toxic by ingestion and inhalation.

Use: Post-emergence herbicide for grassy weeds.
Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

sodium methiodal (sodium iodomethanesulfonate)
 $\text{ICH}_2\text{SO}_3\text{Na}$.

Properties: A white crystalline powder; odorless with slight salty taste followed by sweetish aftertaste. Decomposes on exposure to light; solutions are neutral to litmus; soluble in water; very soluble in methanol; slightly soluble in alcohol; practically insoluble in acetone, ether and benzene.

Derivation: From sodium sulfite and methylene iodide.

Grade: N.F.

Use: Medicine (as radiopaque contrast medium).

sodium methylate (sodium methoxide) CH_3ONa .

Properties: White, free-flowing powder; sensitive to oxygen; decomposed by water. Soluble in methyl and ethyl alcohol. Decomposes in air above 260°F . Containers: Steel drums; also 25% solution in methanol in drums. Bulk density 4.15 lb/gal.

Hazard: (Solid) Flammable when exposed to heat or flame. (Solution). Flammable, moderate fire risk. Solution contains methyl alcohol, and is toxic and corrosive to tissue.

Uses: Condensation reactions; catalyst for treatment of edible fats and oils, especially lard; intermediate for pharmaceuticals; preparation of sodium cellulose; analytical reagent.

Shipping regulations: (Rail) (dry) Yellow label; (alcohol mixture) Red label. (Air) (dry) Flammable Solid label; (alcohol mixture) Flammable Liquid label; Corrosive label.

sodium methyl carbonate CH_3OCOONa .

Properties: White powder; m.p. 330°C (decomposes); sp. gr. 1.66; purity 90% min.

sodium N-methyldithiocarbamate dihydrate
 $\text{CH}_3\text{NHC(S)SNa} \cdot 2\text{H}_2\text{O}$.

Properties: White crystalline solid; readily soluble in water; moderately soluble in alcohol; stable in concentrated aqueous solution but decomposed in dilute aqueous solution; unstable in moist soil.

Hazard: Irritant to tissue; may be toxic to plants and vegetation.

Uses: Fungicide, nematocide, weed killer, and insecticide; soil fumigant.

See also "Vapam."

sodium N-methyl-N-oleoyl taurate (oleyl methyl tauride) $(\text{CH}_3)(\text{CH}_2)_7\text{CHCH}(\text{CH}_2)_7\text{CON}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{SO}_3\text{Na}$.

Properties: Fine white powder. Sweet odor. Non-toxic. Grades: Technical, 32% purity (remainder is mainly sodium sulfate).

Uses: Detergent; pesticide aid.

sodium methyl silicate. Most effective water-repellent and cleaner for limestone, concrete and similar masonry. Reaction product of aqueous sodium hydroxide and a resinous silicone. Total solids about 30%.

sodium N-methyltaurate. See N-methyltaurine.

sodium molybdate. Commercially, the normal molybdate Na_2MoO_4 or its dihydrate (called sodium molybdate crystals). Chemically, a wide variety of complex molybdates with sodium are known.

Properties: Small, lustrous, crystalline plates; soluble

in water; m.p. 687°C ; sp. gr. 3.28 (18°C). Noncombustible.

Derivation: By the action of sodium hydroxide on molybdenum trioxide. Complex molybdates are prepared by dissolving large amounts of molybdenum trioxide in solutions of normal molybdates.

Grades: Anhydrous; crystals.

Containers: 100-, 150-, 200-, 385-lb drums.

Hazard: Moderately toxic and irritant.

Uses: Reagent in analytical chemistry; medicine; paint pigment; production of molybdated toners and lakes; metal finishing; fertilizer; brightening agent for zinc plating; corrosion inhibitor; catalyst in dye and pigment production; additive for fertilizers and feeds.

sodium 12-molybdophosphate (sodium phospho-12-molybdate) $\text{Na}_3\text{PMo}_{12}\text{O}_{40}$.

Properties: Yellow crystals; sp. gr. 2.83. Soluble in water, although less soluble than the free acid; strong oxidizing action in aqueous solution.

Grade: Technical.

Uses: Analysis; neuromicroscopy; catalysts; additives in photographic processes; imparting water resistance to plastics adhesives, and cements; pigments. See also heteromolybdate.

sodium 12-molybdosilicate (sodium silico-12-molybdate) $\text{Na}_4\text{SiMo}_{12}\text{O}_{40} \cdot x\text{H}_2\text{O}$.

Properties: Yellow crystals; density 3.44 g/cc; soluble in water, acetone, alcohol, ethyl acetate. Insoluble in ether, benzene, and cyclohexane.

Grade: Reagent.

Containers: 24-gal drums.

Hazard: Water solution has strong oxidizing action; store away from organic materials.

Uses: Catalysts; reagents; fixing and oxidizing agents in photography; precipitants and ion exchangers in atomic energy; plating processes; imparting water resistance to plastics, adhesives, and cement.

sodium monofluorophosphate (MFP). Tooth decay preventive in dental cream.

sodium monoxide (sodium oxide) Na_2O .

Properties: White powder, sp. gr. 2.27; sublimes 1275°C . Soluble in molten caustic soda or potash. Converted to sodium hydroxide by water.

Containers: 60-lb pails; 300-lb drums.

Hazard: Caustic and strong irritant when wet with water.

Uses: Condensing or polymerizing agent in organic reactions; dehydrating agent; strong base.

Shipping regulations: (Air) Corrosive label.

sodium myristyl sulfate $\text{NaC}_{14}\text{H}_{29}\text{SO}$. Anionic detergent.

Uses: Foaming, wetting, and emulsifying in cosmetic, household and industrial uses.

sodium naphthalenesulfonate $\text{C}_{10}\text{H}_7\text{SO}_3\text{Na}$.

Properties: Yellowish, crystalline plates, or white, odorless scales. Soluble in water; insoluble in alcohol. Could be either the 1- or 2-(alpha or beta) sulfonate. Combustible.

Grade: Technical.

Containers: 360-, 500-lb barrels.

Hazard: May be toxic by ingestion and inhalation.

Uses: Organic preparations; liquefying agent in animal glue preparations; naphthols.

sodium naphthenate. A white paste. The most important of the naphthenic acid salts. Commercial sam-

ples have consistency of grease, but this will vary with source and manner of processing. Excellent emulsifying and foam-producing properties; low hydrolytic dissociation.

Uses: Detergent; emulsifier; disinfectant; manufacture of paint driers. See also naphthenic acid.

sodium naphthionate (sodium alpha-naphthylaminesulfonate) $\text{NH}_2\text{C}_{10}\text{H}_6\text{SO}_3\text{Na} \cdot 4\text{H}_2\text{O}$.

Properties: White crystals, become violet on exposure to light. Soluble in water; insoluble in ether. Combustible.

Grades: Technical (paste, crystals).

Uses: Riegler's reagent for nitrous acid; manufacture of dyestuffs.

sodium naphtholsulfonates. See various naphtholsulfonic acids, sodium salts.

sodium naphthylaminesulfonate. See sodium naphthionate.

sodium niobate (sodium columbate) $\text{Na}_2\text{Nb}_2\text{O}_6 \cdot 7\text{H}_2\text{O}$.

Important in the purification of niobium materials. The crystalline compound forms when a niobium compound is treated with hot concentrated sodium hydroxide. It is sparingly soluble in water.

sodium nitrate (soda niter) NaNO_3 . Chile salt-peter (caliche) is impure natural sodium nitrate.

Properties: Colorless, transparent, odorless crystals; saline, slightly bitter taste; sp. gr. 2.267; m.p. 308°C ; explodes at 1000°F ; decomp. at 380°C . Soluble in water and glycerol; slightly soluble in alcohol.

Derivation: From nitric acid and sodium carbonate; and from Chile salt-peter.

Grades: Granular, sticks, powder; crude; 99.5%; double refined; recrystallized; C.P.; technical; reagent; diuretic; F.C.C.

Containers: Tins; glass bottles; multiwall paper sacks; bulk.

Hazard: Fire risk near organic materials. Ignites on friction and explodes when shocked or heated to 1000°F . Content in cured meats, fish, and other food products restricted to 500 ppm. USDA has proposed its elimination.

Uses: Oxidizing agent; solid rocket propellants; fertilizer; flux; glass manufacture; pyrotechnics; reagent; medicine; refrigerant; matches; dynamites; black powders; manufacturing sodium salts and nitrates; dyes; pharmaceuticals; anaphrodisiac; color fixative and preservative in cured meats, fish, etc.; enamel for pottery; modifying burning properties of tobacco. Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

sodium nitrilotriacetate. See nitrilotriacetic acid.

sodium nitrite NaNO_2 .

Properties: Slightly yellowish or white crystals, pellets, sticks or powder. Oxidizes on exposure to air. Soluble in water; slightly soluble in alcohol and ether. Sp. gr. 2.157; m.p. 271°C ; b.p. explodes at 1000°F ; decomp. at 320°C .

Grades: Reagent; technical; U.S.P.; F.C.C.

Containers: 25-, 100-lb drums; 150-lb kegs; 400-lb barrels.

Hazard: Dangerous fire and explosion risk when heated to 1000°F or in contact with organic materials. Strong oxidizing agent. Content in meats and fish products restricted to 200 ppm, and may be reduced to 100 ppm.

Uses: Diazotization (by reaction with HCl to form nitrous acid); rubber accelerators; color fixative and preservative in cured meats, meat products, fish,

etc.; pharmaceuticals; photographic and analytical reagent; dye manufacture; preparation of nitric oxide.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

sodium nitroferricyanide (sodium nitroprussiate; sodium nitroprusside) $\text{Na}_2\text{Fe}(\text{CN})_5\text{NO} \cdot 2\text{H}_2\text{O}$.

Properties: Red, transparent crystals; sp. gr. 1.72. Soluble in water, with slow decomposition; slightly soluble in alcohol.

Grades: Reagent; technical.

Use: Analytical reagent.

sodium para-nitrophenolate. See para-nitrophenol, sodium salt.

sodium novobiocin. See novobiocin.

sodium nucleinate (sodium nucleate).

Properties: Yellowish-white almost odorless powder containing approximately 4.5% sodium. Soluble in water; insoluble in alcohol.

Derivation: From yeast.

Use: Medicine.

sodium octyl sulfate $\text{C}_8\text{H}_{17}\text{OSO}_3\text{Na}$. Anionic detergent. Available commercially as a 35% solution.

Uses: Wetting, dispersing, and emulsifying agent.

sodium oleate $\text{C}_{17}\text{H}_{33}\text{COONa}$.

Properties: White powder; slight tallow-like odor. M.p. $232\text{--}235^\circ\text{C}$. Soluble in water with partial decomposition; soluble in alcohol. Combustible; low toxicity.

Derivation: Action of alcoholic sodium hydroxide on oleic acid.

Containers: Bags; barrels; drums.

Uses: Ore flotation; waterproofing textiles; emulsifier of oil/water systems.

sodium orthophosphate. See sodium phosphate, mono-, di, and tribasic.

sodium orthosilicate $\text{Na}_2\text{SiO}_3 \cdot 2\text{NaOH}$ or other proportions such as $2 \text{Na}_2\text{O} \cdot \text{SiO}_2$ (anhydrous) or $2\text{Na}_2\text{O} \cdot \text{SiO}_2 \cdot 5.4\text{H}_2\text{O}$.

Properties: (Composition $2\text{Na}_2\text{O} \cdot \text{SiO}_2$). Dustless white, flaked product; density 75 lb/cu ft; total Na_2O content 60.8%; percent of total Na_2O in active form 59.0%. Soluble in water; pH of a 1% solution 13.0.

Containers: Bags; fiber drums; carlots.

Hazard: Strong irritant to skin, eyes, and mucous membranes.

Uses: Commercial laundries; metal cleaning; heavy-duty cleaning.

sodium oxalate $\text{Na}_2\text{C}_2\text{O}_4$.

Properties: White, crystalline powder; sp. gr. 2.34; m.p. $250\text{--}270^\circ\text{C}$ (decomposes). Soluble in water; insoluble in alcohol.

Grades: Reagent; technical, 88%, 99%.

Containers: 100-lb bags; 225-lb barrels.

Hazard: Moderately toxic by ingestion.

Uses: Reagent; textile finishing; pyrotechnics; leather finishing; blue printing.

sodium oxide. See sodium monoxide.

sodium palconate. The sodium salt of an acid that may be extracted with alkali from redwood dust. The dark reddish brown material consists mainly of a partially methylated phenolic acid containing aliphatic hydroxyls, phenolic hydroxyls and carboxyl groups in the ratio of 2:4:3. The viscosity of aqueous solutions rises rapidly with concentration.

Uses: To control viscosity and water loss in drilling muds, and as a dispersing agent.

sodium palladium chloride. See palladium sodium chloride.

sodium palmitate $\text{CH}_3(\text{CH}_2)_{14}\text{COONa}$. The sodium salt of palmitic acid. Combustible. Low toxicity. Uses: Polymerization catalyst for synthetic rubbers; laundry and toilet soaps; detergents; cosmetics; pharmaceuticals; printing inks; emulsifier.

sodium paraperiodate (sodium triparaperiodate)

$\text{Na}_3\text{H}_2\text{IO}_6$.

Properties: White crystalline solid; very slightly soluble in water; soluble in concentrated sodium hydroxide solutions.

Uses: Selectively oxidizes specific carbohydrates and amino acids; wet-strengthens paper; aids combustion of tobacco.

sodium pentaborate $\text{Na}_2\text{B}_{10}\text{O}_{16} \cdot 10\text{H}_2\text{O}$.

Properties: White crystals; free flowing; stable under ordinary conditions; solubility in water, 15.40% (20°C), increasing with temperature; sp. gr. 1.72; pH of solution approx 7.5. Noncombustible; low toxicity.

Containers: 100-lb paper bags.

Uses: Weed killer; cotton defoliant; fireproofing compositions; glass manufacture; boron supplement for tree fruit and truck crops.

sodium pentachlorophenate $\text{C}_6\text{Cl}_5\text{ONa}$.

Properties: White or tan powder; soluble in water, ethanol, and acetone; insoluble in benzene.

Containers: Bags; drums; carlots.

Grades: Technical; powder, pellets, or briquettes.

Hazard: Avoid skin contact and dust inhalation.

Uses: Fungicide, herbicide, slimicide; fermentation disinfectant, especially in finishes and papers.

sodium pentobarbital. See barbiturate.

"Sodium Pentothal." See "Pentothal," thiopental.

sodium perborate (sodium metaborate peroxyhydrate) $\text{NaBO}_2 \cdot 3\text{H}_2\text{O}$ or $1\text{H}_2\text{O}$. Often described as sodium peroborate tetrahydrate, $\text{NaBO}_3 \cdot 4\text{H}_2\text{O}$; see also sodium borate perhydrate.

Properties: White, odorless crystals or powder; salty taste. M.p. 63°C; loses H_2O at 130–150°C. Stable in cool, dry air but decomposes with evolution of oxygen in warm or moist air. Moderately soluble in water (with decomposition) and glycerol. pH of aqueous solutions 10.0 to 10.3. Active oxygen content 10% min.

Derivation: (a) Electrolysis of a solution of borax and soda ash; (b) crystallization from solution of borax or boric acid, sodium peroxide, and hydrogen peroxide.

Grades: Technical; C.P.; N.F. (as $\text{NaBO}_3 \cdot 4\text{H}_2\text{O}$).

Containers: Cartons; boxes; bags.

Hazard: Moderately toxic by ingestion. Fire risk in contact with organic materials. Strong oxidizing agent.

Uses: Developing vat dyes; textile bleaching; synthetic detergents; neutralizing cold wave preparations; dental compositions; electroplating; laboratory reagent; germicide; deodorant; mouthwash.

sodium percarbonate $\text{Na}_2\text{C}_2\text{O}_6$ or Na_2CO_3 . Decomposes in aqueous solution to hydrogen peroxide and sodium carbonate. A stable form has been developed and is commercially available.

Hazard: Moderately toxic by ingestion. Fire risk near organic materials. Strong oxidizing agent.

Uses: Substitute for sodium perborate in detergents.

sodium perchlorate NaClO_4 , sometimes with $1\text{H}_2\text{O}$.

Properties: White deliquescent crystals. Soluble in water and alcohol. M.p. 482°C; b.p., decomposes; sp. gr. 2.02.

Derivation: (a) Sodium chlorate and sodium chloride are mixed and heated until fused. The unchanged chloride is leached out. (b) A cold solution of sodium chlorate is electrolyzed, the solution concentrated and crystallized.

Hazard: Dangerous fire and explosion risk in contact with organic materials and sulfuric acid. Moderately toxic and irritant.

Uses: Explosives; jet fuel; analytical reagent.

Shipping regulations: (Rail) Perchlorates, n.o.s., Yellow label. (Air) Oxidizer label.

sodium periodate (sodium metaperiodate) (a) NaIO_4 ; (b) $\text{NaIO}_4 \cdot 3\text{H}_2\text{O}$. See also sodium paraperiodate.

Properties: Colorless crystals; sp. gr. (a) 3.865 (16°C); (b) 3.219 (18°C); m.p. (a) 300°C (dec), (b) 175°C (dec). Very soluble in water.

Containers: Glass bottles; steel pails.

Hazard: Toxic by ingestion; fire risk in contact with organic materials.

Uses: Source of periodic acid; analytical reagent; oxidizing agent.

sodium permanganate $\text{NaMnO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Purple to reddish-black crystals or powder; soluble in water. Sp. gr. 2.47; m.p. 170°C (dec).

Derivation: Sodium manganate is dissolved in water and chlorine or ozone passed in. The solution is concentrated and crystallized.

Grades: Technical; sold commercially in solution.

Containers: Wooden barrels; steel drums; glass bottles.

Hazard: Toxic; dangerous fire risk in contact with organic materials. Strong oxidizing agent.

Uses: Oxidizing agent; disinfectant; bactericide; manufacture of saccharin; antidote for poisoning by morphine, curare and phosphorus.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

sodium peroxide Na_2O_2 .

Properties: Yellowish white powder, turning yellow when heated. Absorbs water and carbon dioxide from air. Active oxygen content approximately 20% by weight; sp. gr. 2.805; m.p. 460°C (dec); b.p. 657°C (dec). Soluble in cold water, with evolution of heat.

Derivation: Metallic sodium is heated at 300°C in aluminum trays in a retort in a current of dry air, from which the carbon dioxide has been removed.

Grades: Technical; reagent.

Containers: Drums; carlots; truckloads.

Hazard: Dangerous fire and explosion risk in contact with water, alcohols, acids, powdered metals, and organic materials. Keep dry. Toxic by ingestion. Strong oxidizing agent.

Uses: Oxidizing agent; bleaching of miscellaneous materials including paper and textiles; deodorant; antiseptic; medicine; organic chemicals; water purification; pharmaceuticals; oxygen generation for diving bells, submarines, etc.; textile dyeing and printing; ore processing; analytical reagent; calorimetry; germicidal soaps.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label. Not acceptable on passenger planes.

sodium persulfate (sodium peroxydisulfate) $\text{Na}_2\text{S}_2\text{O}_8$.
Properties: White, crystalline powder; soluble in water; decomposed by alcohol; decomposes in moist air.
Uses: Bleaching agent (fats, oils, fabrics, soap); battery depolarizers; medicine.

sodium phenate (sodium phenolate; sodium carbolate) $\text{C}_6\text{H}_5\text{ONa}$.

Properties: White, deliquescent crystals. Soluble in water and alcohol; decomposed by carbon dioxide in the air.

Derivation: Phenol is dissolved in caustic soda solution, concentrated and crystallized.

Hazard: Strong irritant to skin and tissue.

Uses: Antiseptic; salicylic acid; organic synthesis.

Shipping regulations: (Air) Corrosive label.

sodium phenobarbital (phenobarbital, soluble). See barbiturate.

sodium phenolate. Legal label name (Air) for sodium phenate.

sodium phenolsulfonate (sodium sulfocarbolate) $\text{HOC}_6\text{H}_4\text{SO}_3\text{Na} \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals or granules, slightly efflorescent; chars at high temperature, evolving phenol. Soluble in water, hot alcohol, and glycerol.

sodium phenylacetate (sodium alpha-toluate) $\text{C}_6\text{H}_5\text{CH}_2 \cdot \text{COONa}$.

Properties: Soluble in water; insoluble in alcohol, ether, and ketones; 50% aqueous solution has pH 7.0 to 8.5 and is pale yellow. Solution tends to crystallize at 15°C.

Containers: 3000-gal tanks; 500-lb drums.

Grades: 50% solution; dry salt.

Uses: Precursor in production of penicillin G; intermediate for producing heavy metal salts which act as fungicides.

sodium N-phenylglycinamide-para-arsonate. See trypanarsamide.

sodium ortho-phenylphenate (sodium ortho-phenylphenolate) $\text{C}_6\text{H}_4(\text{C}_6\text{H}_5)\text{ONa} \cdot 4\text{H}_2\text{O}$.

Properties: Practically white flakes. Bulk density 38–43 lb/cu ft; pH of saturated solution in water 12.0–13.5. Soluble in water, methanol, acetone.

Hazard: Probably toxic.

Use: Industrial preservative (bactericide and fungicide); mold inhibitor for apples and other fruit (post-harvest).

sodium phenylphosphinate $\text{C}_6\text{H}_5\text{PH}(\text{O})(\text{ONa})$.

Properties: Crystals; m.p. 355°C (decomposes to give phenylphosphine); stable at room temperature; soluble in water.

Hazard: May be toxic.

Uses: Antioxidant; heat and light stabilizer.

sodium phosphate. See sodium metaphosphate; sodium phosphate, dibasic; sodium phosphate, monobasic; sodium phosphate P-32; sodium phosphate, tribasic; sodium polyphosphate; sodium pyrophosphate; sodium pyrophosphate, acid; sodium tripolyphosphate.

sodium phosphate, dibasic (DSP; disodium phosphate; sodium orthophosphate, secondary; disodium orthophosphate; disodium hydrogen phosphate) (a) Na_2HPO_4 ; (b) $\text{Na}_2\text{HPO}_4 \cdot 2\text{H}_2\text{O}$; (c) $\text{Na}_2\text{HPO}_4 \cdot 7\text{H}_2\text{O}$; (d) $\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$. The dihydrate (b) is also marketed as the duohydrate.

Properties: Colorless, translucent crystals or white powder; saline taste. Soluble in water; very soluble

in alcohol. (a) Hygroscopic; converted to sodium pyrophosphate at about 240°C. (b) M.p. loses H_2O at 92.5°C; sp. gr. (15°C) 2.066; (c) Sp. gr. 1.679; loses $5\text{H}_2\text{O}$ at 48°C; (d) M.p. 35°C; sp. gr. 1.5235. Readily loses $5\text{H}_2\text{O}$ on exposure to air at room temperature; loses $12\text{H}_2\text{O}$ at 100°C. pH of 1% solution 8.0–8.8. Low toxicity. Nonflammable.

Derivation: (1) By treating phosphoric acid with a slight excess of soda ash, boiling the solution to drive off carbon dioxide, and cooling to permit the dodecahydrate to crystallize; (2) by precipitating calcium carbonate from a solution of dicalcium phosphate with soda ash.

Grades: Commercial; N.F. (a) and (c); F.C.C. (a) or (b).

Containers: Paper bags; fiber drums; barrels.

Uses: Chemicals; dyes; fertilizers; pharmaceuticals; medicine; textiles (weighting silk, dyeing and printing); fireproofing wood, paper and ceramic glazes; tanning; paint pigments; baking powders; galvanoplastics; soldering enamels; analytical reagent; cheese; detergents; water treatment; dietary supplement; buffer; sequestrant in foods.

sodium phosphate, monobasic (sodium acid phosphate; sodium biphosphate; sodium orthophosphate, primary; MSP; sodium dihydrogen phosphate) (a) NaH_2PO_4 ; (b) $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$.

Properties: (a) White crystalline powder; slightly hygroscopic; very soluble in water; has acid reaction; forms sodium acid pyrophosphate at 225–250°C and sodium metaphosphate at 350–400°C; (b) large, transparent crystals; m.p. loses H_2O at 100°C; sp. gr. 2.040; very soluble in water; insoluble in alcohol. pH of 1% solution 4.4–4.5. Low toxicity; nonflammable.

Derivation: By treating disodium phosphate with proper proportion of phosphoric acid.

Grades: Commercial; food; (b) N.F.; (a) F.C.C.

Containers: Paper bags; drums; barrels.

Uses: Boiler water treatment; electroplating; dyeing; acid cleansers; baking powders; cattle food supplement; buffer, emulsifier, nutrient supplement in food; laboratory reagent.

sodium phosphate P 32 (sodium radio-phosphate). A radioactive form of sodium phosphate (which phosphate is not specified) containing phosphorus 32 which can be used as a tracer. See phosphorus 32.

Grade: U.S.P., as solution.

Use: Medicine; biochemical research.

sodium phosphate, tribasic (TSP; trisodium orthophosphate; trisodium phosphate; tertiary sodium phosphate; sodium orthophosphate, tertiary) $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$.

Properties: Colorless crystals; soluble in water. Sp. gr. 1.62 (20°C); m.p. 75°C (dec); loses $12\text{H}_2\text{O}$ at 100°C. pH of 1% solution is 11.8–12.0. Nonflammable.

Derivation: By mixing soda ash and phosphoric acid in proper proportions to form disodium phosphate, and then adding caustic soda.

Grades: Commercial; high purity; C.P.; F.C.C. (anhydrous). Anhydrous salt also available.

Containers: Barrels; bags.

Hazard: Moderately toxic by ingestion; irritant to tissue.

Uses: Water softeners; boiler compounds; detergent; metal cleaner; textiles; manufacture of paper; laundering; tanning; sugar purification; photographic developers; medicine; paint removers; industrial cleaners; dietary supplement; buffer; emulsifier.

sodium phosphide Na_3P .

Properties: Red solid; decomposes on heating and in water, forming phosphine.

Hazard: Dangerous fire risk; reacts with water and acids to form phosphine (q.v.).

Shipping regulations: (Air) Flammable Solid label. Not acceptable on passenger planes. (Rail) Not listed.

sodium phosphite $\text{Na}_2\text{HPO}_3 \cdot 5\text{H}_2\text{O}$.

Properties: White, crystalline powder. Hygroscopic. Soluble in water; insoluble in alcohol. M.p. 53°C ; b.p. $200\text{--}250^\circ\text{C}$ (dec).

Use: Medicine; antidote in mercuric chloride poisoning.

sodium phosphoaluminate. White powder composed primarily of sodium aluminate (hydrated), sodium phosphate (ortho) and small amounts of sodium carbonate and sodium silicate. Used primarily in the paper industry as a sizing adjunct, as an aid in retention of filler and fiber and in pH control. Also used in boiler feed water treatment and as a food additive.

sodium phospho-12-molybdate. See sodium 12-molybdophosphate.

sodium phospho-12-tungstate. See sodium 12-tungstophosphate.

sodium phytate (USAN) (inositol hexaphosphoric ester, sodium salt) $\text{C}_6\text{H}_9\text{O}_{24}\text{P}_6\text{Na}_9$.

Properties: Hygroscopic powder, water-soluble.

Uses: Chelating agent for trace (heavy) metals; color improvement; medicine.

sodium picramate $\text{NaOC}_6\text{H}_2(\text{NO}_2)_2\text{NH}_2$.

Derivation: Yellow, water-soluble salt resulting from neutralization of picramic acid with caustic soda.

Containers: Drums.

Hazard: Dangerous fire and explosion hazard when dry. Toxic by ingestion and skin absorption.

Uses: Manufacture of dye intermediates; organic synthesis.

Shipping regulations: Wet with not less than 20% water; (Rail) Yellow label. (Air) Flammable Solid label. Not accepted on passenger planes. Dry, or wet with less than 20% water: Not acceptable.

sodium platinichloride. See sodium chloroplatinate.

sodium plumbate $\text{Na}_2\text{PbO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Fused, light yellow lumps. Hygroscopic. Decomposed by water and acids; soluble in alkalis.

sodium plumbite Na_2PbO_2 .

Derivation: Solution of PbO (litharge) in sodium hydroxide.

Hazard: Highly toxic and corrosive.

Use: Doctor solution (q.v.) for improving the odor of gasoline and other petroleum distillates.

sodium polyphosphate $\text{Na}_{n+2}\text{P}_n\text{O}_{3n+1}$. The two prominent crystalline sodium polyphosphates are the pyrophosphate ($n = 2$) and the triphosphosphate, also known as the triphosphate ($n = 3$). The term sodium polyphosphate also includes the system of vitreous sodium phosphates for which the mole ratio of $\text{Na}_2\text{O} : \text{P}_2\text{O}_5$ is between 1 and 2. See also sodium metaphosphate.

Uses: Sequestering and deflocculating agents, primarily in water treatment, food processing and cleaning compounds; heavy-set detergent builders. See sodium meta-, pyro-, and tripolyphosphates.

sodium polystyrene sulfonate. A cation-exchange resin prepared in the sodium form which can exchange about 12% of its weight of potassium.

Properties: Golden brown, fine powder; odorless and tasteless; insoluble in water.

Grade: U.S.P.

Use: Medicine.

sodium polysulfide Na_2S_x .

Properties: Yellow-brown granular free-flowing polymer; density 56 lb/cu ft. Combustible.

Containers: 100-lb, 400-lb drums.

Uses: Manufacture of sulfur dyes and colors, insecticides, oil-resistant synthetic rubber ("Thiokol"), petroleum additives; electroplating.

sodium-potassium alloy. Legal label name for NaK (q.v.).

sodium-potassium carbonate (potassium-sodium carbonate) $\text{NaKCO}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless crystals. The double salt fuses more readily than the single salts; sp. gr. 1.6344; m.p. 135°C (dec). Soluble in water.

Derivation: Mixture of potassium and sodium carbonates.

Use: Analysis (flux).

sodium-potassium phosphate (potassium-sodium phosphate) $\text{NaKHPO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: White powder; stable in air. Soluble in water.

sodium-potassium tartrate. See potassium-sodium tartrate.

sodium propionate $\text{CH}_3\text{CH}_2\text{COONa}$ or $\text{C}_2\text{H}_5\text{COONa} \cdot x\text{H}_2\text{O}$.

Properties: Transparent crystals or granules; almost odorless; deliquescent in moist air; soluble in water and alcohol. Combustible; low toxicity.

Grades: N.F.; F.C.C.

Containers: 25-, 100-, 250-lb drums.

Uses: Fungicide; mold-preventive; food preservative (bread and other bakery products).

sodium prussiate, red. See sodium ferricyanide.

sodium prussiate, yellow. See sodium ferrocyanide.

sodium pyroantimonate. See sodium antimonate.

sodium pyroborate. See sodium borate.

sodium pyrophosphate (tetrasodium pyrophosphate; sodium pyrophosphate, normal; TSPP) (a) $\text{Na}_4\text{P}_2\text{O}_7$; (b) $\text{Na}_4\text{P}_2\text{O}_7 \cdot 10\text{H}_2\text{O}$. One of the sodium polyphosphates (q.v.).

Properties: Colorless, transparent crystals or white powder. (a) M.p. 880°C ; sp. gr. 2.45; soluble in water; decomposes in alcohol; (b) m.p. 94°C (loses H_2O); sp. gr. 1.8 soluble in water; insoluble in alcohol and ammonia. Low toxicity.

Derivation: By fusing sodium phosphate, dibasic.

Grades: Pure crystals; dried; fused; C.P.; F.C.C.

Containers: Bottles; paper bags; drums; bulk cars.

Uses: Water softener; soap and synthetic detergent builder; dispersing and emulsifying agent; metal cleaner; boiler water treatment; viscosity control of drilling muds; de-inking news print; synthetic rubber manufacture; textile dyeing; scouring of wool; buffer; sequestrant; nutrient supplement.

sodium pyrophosphate, acid (disodium pyrophosphate; sodium acid pyrophosphate; disodium diphosphate;

disodium dihydrogen pyrophosphate; SAPP)
 $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7 \cdot 6\text{H}_2\text{O}$.

Properties: White crystalline powder; m.p. (dec) 220°C ; sp. gr. 1.862; soluble in water. Low toxicity. Derivation: Incomplete decomposition of monobasic sodium phosphate.

Grades: Technical; food; F.C.C.

Containers: 100-lb bags; 125-, 350-lb drums.

Uses: Electroplating; metal cleaning and phosphatizing; drilling muds; baking powders and leavening agent; buffer; sequestrant; peptizing agent in cheese and meat products; frozen desserts.

sodium pyrophosphate, normal. See sodium pyrophosphate.

sodium pyrophosphate peroxide $\text{Na}_4\text{P}_2\text{O}_7 \cdot 2\text{H}_2\text{O}_2$.

Properties: White powder; bulk density 73 lb/cu ft. Active oxygen minimum 9.0% by wt. Water-soluble; mildly alkaline.

Containers: Fiber drums.

Hazard: Fire risk in contact with organic materials. Oxidizing agent.

Uses: Denture cleansers, dentrifices, household and laundry detergents; antiseptic.

sodium pyroracemate. See sodium pyruvate.

sodium pyrosulfite. See sodium metabisulfite.

sodium pyrovanadate $\text{Na}_4\text{V}_2\text{O}_7 \cdot 8\text{H}_2\text{O}$.

Properties: Colorless six-sided plates. Soluble in water; insoluble in alcohol; m.p. (anhydrous) 654°C . Derivation: Sodium hydroxide and vanadium pentoxide in water solution.

sodium pyruvate (sodium pyroracemate; sodium acetylformate) NaOCCOCH_3 . White powder; apparent melting point 205°C . Very soluble in water.

Use: Biochemical research.

sodium resinate. See sodium abietate.

sodium rhodanate. See sodium thiocyanate.

sodium rhodanide. See sodium thiocyanate.

sodium ricinoleate $\text{C}_{17}\text{H}_{33}\text{OHCOONa}$.

Properties: White or slightly yellow, nearly odorless powder; soluble in water or alcohol. Combustible; low toxicity.

Derivation: Sodium salt of the fatty acids from castor oil.

Uses: Emulsifying agent in special soaps; medicine.

sodium saccharin (sodium benzosulfimide; gluside, soluble; soluble saccharin) $\text{C}_7\text{H}_4\text{NNaO}_3\text{S} \cdot 2\text{H}_2\text{O}$. The sodium salt of saccharin (q.v.).

Properties: White crystals or crystalline powder; odorless or with a faint aromatic odor; in dilute solutions has an intensely sweet taste (500 times as sweet as sugar). Very soluble in water; slightly soluble in alcohol.

Grades: N.F.; F.C.C.

Uses: Medicine; foods (non-nutritive sweetener).

sodium salicylate $\text{HOC}_6\text{H}_4\text{COONa}$.

Properties: Lustrous, white, crystalline scales or amorphous powder; saline taste. Soluble in water, alcohol and glycerol. Combustible. Low toxicity.

Grades: Technical; C.P.; U.S.P.

Containers: Drums; barrels.

Uses: Medicine; production of salicylic acid; preservative for paste, mucilage, glue and hides.

sodium sarcosinate (sodium sarcosine)

$\text{CH}_3\text{NHCH}_2\text{COONa}$.

Grade: 33% aqueous solution.

Uses: Intermediate; stabilizer for diazonium salts; chelating agent.

sodium secobarbital. See barbiturate.

sodium selenate $\text{Na}_2\text{SeO}_4 \cdot 10\text{H}_2\text{O}$.

Properties: White crystals. Sp. gr. 1.603-1.620. Soluble in water.

Hazard: Toxic by ingestion. Tolerance (as Se), 0.2 mg per cu meter.

Uses: Reagent; insecticide for nonedible plants.

sodium selenite $\text{Na}_2\text{SeO}_3 \cdot 5\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water; insoluble in alcohol.

Derivation: By neutralizing selenious acid with sodium carbonate and crystallizing.

Hazard: Toxic by ingestion. Tolerance (as Se), 0.2 mg per cu meter.

Uses: Glass manufacture; reagent in bacteriology; testing germination of seeds; decorating porcelain.

sodium sesquicarbonate (sesqui)

$\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White needle-shaped crystals; sp. gr. 2.112; m.p., decomposes. Soluble in water. Less alkaline than sodium carbonate. Noncombustible. Nontoxic.

Derivation: Crystallization of a solution containing equimolar quantities of sodium carbonate and sodium bicarbonate; also occurs native (as trona) in desert areas and in Searles Lake brine (q.v.).

Grades: Technical; F.C.C.

Containers: Barrels and kegs; paper or burlap bags; fiber drums; bulk.

Uses: Detergent and soap builder; mild alkaline agent for general cleaning and water softening; bath crystals; alkaline agent in leather tanning; food additive.

sodium sesquisilicate. $\text{Na}_4\text{Si}_2\text{O}_7$ (anhydrous).

Properties: White; granular powder; soluble in water; pH of 1% solution 12.7. Noncombustible.

Derivation: Crystallization from solutions obtained by heating silica or sodium metasilicate with sodium hydroxide. Intermediate in composition between ortho- and metasilicates; less alkaline than sodium orthosilicate.

Containers: Bags; barrels; fiber drums; bulk.

Uses: Heavy-duty cleaning (metals, laundries); textile processing.

sodium silicate (water glass). See also the other soluble sodium silicates: sodium metasilicate anhydrous, sodium metasilicate pentahydrate, sodium sesquisilicate, sodium orthosilicate. The simplest form of glass. Formulas: Vary from $\text{Na}_2\text{O} \cdot 3.75 \text{SiO}_2$ to $2\text{Na}_2\text{O} \cdot \text{SiO}_2$, and with various proportions of water.

Properties: Lumps of greenish glass soluble in steam under pressure; white powders of varying degrees of solubility; or liquids cloudy or clear and varying from highly fluid to extreme viscosity; viscosity range from 0.4 to 600,000 poises; f.p. slightly lower than water; miscible with some polyhydric alcohols; partially miscible with primary alcohols and ketones. Gels form with acids between pH 3 to 9; coagulated by brine; precipitated by alkaline earth and heavy metal ions. Noncombustible. Nontoxic.

Derivation: By fusing sand and soda ash.

Grades (liquid): 40, 47, 52° Be.

Containers: Barrels; drums; tank trucks; carlots; bulk.

Uses: Catalysts and silica gels; soaps and detergents; adhesives, especially sealing and laminating paper board containers; water treatment; bleaching and sizing of textiles and paper pulp; ore treatment; soil

solidification; glass foam; pigments; drilling fluids; binder for foundry cores and molds; waterproofing mortars and cements; impregnating wood.

sodium silicoaluminate. See sodium aluminosilicate.

sodium silicofluoride. See sodium fluorosilicate.

sodium silico-12-molybdate. See sodium 12-molybdosilicate.

sodium 12-silicotungstate. See sodium 12-tungstosilicate.

sodium silver chloride. See silver sodium chloride.

sodium silver thiosulfate. See silver sodium thiosulfate.

sodium alpha-sodioacetate. See alpha-sodiosodium acetate.

sodium sorbate $\text{CH}_3\text{CH}:\text{CHCH}:\text{CHCOONa}$. Combustible. Nontoxic.
Uses: Food preservative.

sodium stannate $\text{Na}_2\text{SnO}_3 \cdot 3\text{H}_2\text{O}$, or $\text{Na}_2\text{Sn}(\text{OH})_6$.
Properties: White to light tan crystals; soluble in water; insoluble in alcohol; decomposes in air. Aqueous solution slightly alkaline. Loses $3\text{H}_2\text{O}$ in 140°C .
Derivation: (a) By fusion of metastannic acid and sodium hydroxide. (b) By boiling tin scrap and sodium plumbate solution.

Hazard: Toxic. Tolerance, 2 mg per cubic meter of air.

Uses: Mordant in dyeing; ceramics; glass; source of tin for electroplating and immersion plating; textile fireproofing; stabilizer for hydrogen peroxide; blueprint paper; laboratory reagent.

sodium stearate $\text{NaOCC}_{17}\text{H}_{35}$.

Properties: White powder with fatty odor. Soluble in hot water and hot alcohol; slowly soluble in cold water and cold alcohol; insoluble in many organic solvents.

Impurities: Varying quantities of sodium palmitate.

Grade: Technical.

Containers: 150-lb drums; 200-lb barrels.

Uses: Waterproofing and gelling agent; toothpaste and cosmetics; stabilizer in plastics.

sodium stearoyl 2-lactylate.

Properties: White powder. Melting range $46\text{--}52^\circ\text{C}$. Nontoxic.

Derivation: Sodium salt of reaction product of lactic and stearic acids.

Uses: Emulsifier; dough conditioner; whipping agent in baked products, desserts, and mixes; complexing agent for starches and proteins.

sodium styrenesulfonate $\text{CH}_2:\text{CH}_2\text{C}_6\text{H}_4\text{SO}_3\text{Na}$. White, free-flowing powder.

Use: Reactive monomer. See sodium polystyrenesulfonate.

sodium subsulfite. See sodium thiosulfate.

sodium succinate $\text{Na}_2\text{C}_4\text{H}_4\text{O}_4 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals or odorless granules; soluble in water. Loses $6\text{H}_2\text{O}$ at 120°C .

Use: Medicine.

sodium sulfate, anhydrous Na_2SO_4 . See also salt cake.

Properties: White crystals or powder; odorless; bitter saline taste; sp. gr. 2.671; m.p. 888°C ; soluble in water and glycerol; insoluble in alcohol. Noncombustible; nontoxic.

Derivation: (a) By-product of hydrochloric acid production from salt and sulfuric acid. (b) Purification of natural sodium sulfate from deposits or brines. (c) By-product of phenol manufacture (caustic fusion process); (d) Hargreaves process (q.v.).

Grades: Technical; C.P.; detergent; rayon; glass makers.

Containers: Bags; drums.

Uses: Manufacture of kraft paper, paperboard, and glass; filler in synthetic detergents; sodium salts; ceramic glazes; processing textile fibers; dyes; tanning; glass; pharmaceuticals; freezing mixtures; laboratory reagent; food additive.

sodium sulfate decahydrate (sodium sulfate, crystals; Glauber's salt) $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$.

Properties: Large transparent crystals, small needles, or granular powder; sp. gr. 1.464 (crystals); m.p. 33°C (liquefies); loses water of hydration at 100°C . Soluble in water and glycerin; insoluble in alcohol; solutions neutral to litmus. Nontoxic; nonflammable.

Derivation: Crystallization of sodium sulfate from water solutions. (Glauber's salt); also occurs in nature as mirabilite (q.v.).

Grades: Technical; N.F.

Uses: See under anhydrous form.

sodium sulfhydrate. See sodium hydrosulfide.

sodium sulfide (a) Na_2S ; (b) $\text{Na}_2\text{S} \cdot 9\text{H}_2\text{O}$.

Properties: Yellow or brick red lumps or flakes or deliquescent crystals; (a) sp. gr. 1.856 (14°C); m.p. 1180°C ; (b) sp. gr. 1.427 (16°C); decomposes at 920°C . Soluble in water; slightly soluble in alcohol; insoluble in ether; largely hydrolyzed to sodium acid sulfide and sodium hydroxide.

Derivation: By heating sodium acid sulfate with salt and coal to above 950°C , extraction with water, and crystallization.

Grades: Flake; fused; chip sulfide (60% Na_2S), 60% fused and broken; 30% crystals; liquid.

Containers: Barrels; drums; bulk.

Hazard: Flammable, dangerous fire risk. Strong irritant to skin and tissue. Liberates toxic hydrogen sulfide on contact with acids.

Uses: Organic chemicals; dyes (sulfur); intermediates; rayon (denitrating); leather (depilatory); paper pulp; solvent for gold in hydrometallurgy of gold ores; sulfiding oxidized lead and copper ores preparatory to flotation; sheep dips; photographic reagent; engraving and lithography; analytical reagent.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label.

sodium sulfite (a) Na_2SO_3 ; (b) $\text{Na}_2\text{SO}_3 \cdot 7\text{H}_2\text{O}$.

Properties: White crystals or powder; saline, sulfurous taste. Soluble in water; sparingly soluble in alcohol. Sp. gr.: (a) 2.633; (b) 1.5939. M.p.: (a) decomposes; (b) loses $7\text{H}_2\text{O}$ at 150°C .

Derivation: (a) Sulfur dioxide is reacted with soda ash and water, and a solution of the resulting sodium bisulfite is treated with additional soda ash; (b) by-product of the caustic fusion process for phenol.

Grades: Reagent; technical; F.C.C.

Containers: Bags; drums.

Hazard: Use prohibited in meats and other sources of Vitamin B₁.

Uses: Paper industry (semichemical pulp); water treatment; photographic developer; food preservative and antioxidant; textile bleaching (antichlor); dietary supplements.

sodium sulfobromophthalein $C_{20}H_8Br_4O_{10}S_2Na_2$.

Properties: White, crystalline powder; odorless with a bitter taste; hygroscopic. Soluble in water; insoluble in alcohol and acetone.

Derivation: From phenol and tetrabromophthalic acid or anhydride.

Grades: U.S.P.; technical.

Use: Medicine (diagnostic aid).

sodium sulfocarbolate. See sodium phenolsulfonate.

sodium sulfocyanate. See sodium thiocyanate.

sodium sulfocyanide. See sodium thiocyanate.

sodium sulfonate. Class name for various sulfonates derived from petroleum, e.g., sodium dodecylbenzenesulfonate; sodium xylenesulfonate; sodium toluenesulfonate. See also sodium alkanesulfonate.

Uses: Textile processing oils; oils for metal working (emulsifying and antirust agents); lubricating oils; emulsifiers for insecticides, herbicides, fungicides; preparation of dyes and intermediates; hydrotropic solvent; coatings in food packaging.

sodium sulforicinoleate.

Derivation: Product of successive sulfonation (partial) and saponification of castor oil. Composition indefinite.

Use: Emulsifying and wetting agent.

sodium sulfoxylate. See sodium formaldehyde sulfoxylate.

sodium tartrate (sal tartar; disodium tartrate)

$Na_2C_4H_4O_6 \cdot 2H_2O$.

Properties: White crystals or granules. Soluble in water; insoluble in alcohol. Sp. gr. 1.794; loses $2H_2O$ at $150^\circ C$. Nontoxic.

Derivation: Neutralization of tartaric acid with sodium carbonate, concentration and crystallization.

Grades: Technical; C.P.; reagent; F.C.C.

Uses: Medicine; chemical reagent; food additive, as sequestrant and stabilizer.

sodium tartrate, acid. See sodium bitartrate.

sodium TCA. See sodium trichloroacetate.

sodium tellurite Na_2TeO_3 .

Properties: White powder; soluble in water.

Hazard: Toxic by ingestion.

Use: Bacteriology; medicine.

sodium tetraborate. See sodium borate.

sodium 2,3,4,6-tetrachlorophenate $C_6HCl_4ONa \cdot H_2O$.

Properties: Buff to light brown flakes; bulk density 26–29 lb/cu ft; pH of water-saturated solution 9.0–13.0. Soluble in water, methanol, acetone.

Hazard: Toxic by ingestion.

Use: Industrial preservative (bactericide and fungicide).

sodium tetradecyl sulfate (sodium 7-ethyl-2-methyl-4-hendecanol sulfate). $C_{14}H_{29}SO_4Na$.

Properties: White, waxy, odorless solid. Soluble in alcohol, ether, and water. 5% solution is clear and colorless. pH (5% solution) 6.5–9.0.

Uses: Medicine; wetting agent.

sodium tetraphosphate. See sodium polyphosphate.

sodium tetrasulfide Na_2S_4 .

Properties: Yellow, hygroscopic crystals or clear dark red liquid; m.p. of crystals $275^\circ C$.

Grade: Aqueous solution containing 40% by weight of compound.

Containers: Glass bottles; carboys; drums.

Hazard: Moderate fire risk when exposed to flame; irritant to skin and tissue.

Uses: Reducing organic nitro compounds; manufacture of sulfur dyes; insecticides and fungicides; ore flotation; soaking hides and skins; preparation of metal sulfide finishes.

sodium thiocyanate (sodium sulfocyanate; sodium sulfo-cyanide; sodium rhodanate; sodium rhodanide) $NaSCN$.

Properties: Colorless, deliquescent crystals or white powder; m.p. $287^\circ C$. Soluble in water and alcohol. Hygroscopic and affected by light.

Derivation: By boiling sodium cyanide with sulfur.

Grades: Technical; pure, crystal or dried; C.P.; reagent; A.C.S.

Containers: Bottles; tins; drums.

Hazard: May be toxic.

Uses: Analytical reagent; dyeing and printing textiles; medicine; black nickel plating; manufacturing other thiocyanate salts and artificial mustard oil; solvent for polyacrylates; medicine.

sodium thioglycolate (sodium mercaptoacetate)

$HSCH_2COONa$. The sodium salt of thioglycolic acid.

Properties: Crystals; characteristic odor; hygroscopic; discolors on exposure to air or iron; soluble in water; slightly soluble in alcohol. Combustible.

Containers: Bottles; carboys.

Hazard: Yields toxic hydrogen sulfide on decomposition. May be toxic by skin absorption.

Uses: Bacteriology; cold waving of hair; depilatory; analytical reagent.

sodium thiopental (thiopentone soluble)

$C_{11}H_{17}N_2O_2SNa$. Sodium 5-ethyl-5-(1-methylbutyl)-2-thiobarbiturate.

Properties: Yellowish white, hygroscopic powder with a disagreeable odor. Soluble in water and alcohol; insoluble in absolute ether, benzene and ligroin. Solution decomposes on standing. Precipitation occurs on boiling of solution.

Grade: U.S.P.

Use: Medicine.

See also barbiturate.

sodium thiosulfate (sodium subsulfite; hypo) $Na_2S_2O_3 \cdot 5H_2O$. The anhydrous salt is also commercially available.

Properties: White, translucent crystals or powder; cooling taste and bitter aftertaste. Soluble in water and oil of turpentine; insoluble in alcohol; deliquescent in moist air; efflorescent above $33^\circ C$ in dry air. Sp. gr. 1.729 ($17^\circ C$); m.p. $48^\circ C$; b.p. decomposes.

Derivation: Heating a solution of sodium sulfite with powdered sulfur.

Grades: Technical; crystals; granulated; photographic; C.P.; pure; U.S.P.; F.C.C.

Containers: Drums; bulk.

Hazard: Use in foods restricted to 0.1%.

Uses: Photography (fixing agent to dissolve unchanged silver salts from exposed negatives); chrome tanning; removing chlorine in bleaching and papermaking; extraction of silver from its ores; dechlorination of water; mordant; reagent; medicine; bleaching bone, straw, ivory; reducing agent in chrome dyeing; sequestrant in foods.

sodium titanate (sodium tritanate) $Na_2Ti_3O_7$.

Properties: White crystals. Insoluble in water; sp. gr. 3.35–3.50; m.p. $1128^\circ C$. Combustible.

Containers: Cartons, drums; carlots.

Use: Welding.

sodium alpha-toluate. See sodium phenylacetate.

sodium toluenesulfonate (para-toluenesulfonic acid, sodium salt) $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_3\text{Na}$.
Properties: Crystals; soluble in water.
Uses: Dye chemistry; hydrotropic solvent.

sodium para-toluenesulfonchloramine. See chloramine

sodium trichloroacetate (sodium TCA) CCl_3COONa .
Containers: Cans; drum; carlots.
Hazard: Toxic by ingestion. Irritant to skin and eyes.
Uses: Herbicide; pesticide.

sodium 2,4,5-trichlorophenolate $\text{C}_6\text{H}_2\text{Cl}_3\text{ONa} \cdot 1\frac{1}{2}\text{H}_2\text{O}$.
Properties: Buff to light brown flakes; bulk density 28–33 lb/cu ft; pH of water-saturated solution 11.0–13.0. Soluble in water, methanol, acetone.
Use: Industrial preservative (bactericide and fungicide).

sodium tridecylbenzenesulfonate. Not a true compound, but a mixture of C_{12} and C_{13} alkyl benzene sulfonates which approximates C_{13} . For derivation and use, see sodium dodecylbenzene sulfonate.

sodium trimetaphosphate. See sodium metaphosphate.

sodium triparaperiodate. See sodium paraperiodate.

sodium triphenyl-para-rosaniline sulfonate. See methylv blue.

sodium triphosphate. See sodium tripolyphosphate.

sodium tripolyphosphate (STPP; sodium triphosphate; tripoly; pentasodium triphosphate) $\text{Na}_5\text{P}_3\text{O}_{10}$. (The sodium phosphate produced in largest volume in the U.S.).

Properties: White powder; two crystalline forms of anhydrous salt (transition pt. 417°C ; m.p. 622°C to give melt and sodium pyrophosphate), and a hexahydrate. Low toxicity.

Derivation: Controlled calcination of sodium orthophosphate mixture from sodium carbonate and phosphoric acid. May contain up to 10% pyrophosphate and up to 5% trimetaphosphate.

Grades: Powdered and granular, F.C.C.; food.

Containers: Multiwall paper bags, drums, bulk carlots or trucklots.

Uses: Water softening; sequestering, peptizing, or deflocculating agent; food additive and texturizer.

sodium trititanate. See sodium titanate.

sodium tungstate (sodium wolframate) $\text{Na}_2\text{WO}_4 \cdot 2\text{H}_2\text{O}$.
Properties: Colorless crystals; soluble in water; insoluble in alcohol and acids. Sp. gr. 3.245; m.p., loses $2\text{H}_2\text{O}$ at 100°C and then melts at 692°C . Low toxicity; noncombustible.

Derivation: By dissolving tungsten trioxide or the ground ore in caustic soda solution, concentration and crystallization.

Grades: Technical; C.P.; crystalline.

Containers: 1-, 5-lb bottles; 25-, 50-lb cans; 100-lb kegs.
Uses: Intermediate in preparation of tungsten and its compounds; reagent; fireproofing fabrics and cellulose.

sodium 12-tungstophosphate (sodium phosphotungstate; phosphotungstic acid, sodium salt) $\text{Na}_3[\text{P}(\text{W}_2\text{O}_7)_6] \cdot x\text{H}_2\text{O}$.

Properties: Yellowish-white powder; very soluble in water and alcohols. An oxidizing agent.

Grades: Reagent; technical.

Uses: Reagent; manufacture of organic pigments; treatment of furs; antistatic agent for textiles; leather

tanning; making plastic films, cements, and adhesives water-resistant.

sodium 12-tungstosilicate $\text{Na}_3\text{SiW}_{12}\text{O}_{40} \cdot 5\text{H}_2\text{O}$.

Properties: White crystalline powder; soluble in water and alcohols, although less so than the free acid. Low toxicity. Noncombustible.

Grades: Reagent; technical.

Uses: Catalyst for organic synthesis; precipitant and inorganic ion-exchanger; additive in plating processes.

sodium undecylenate $\text{CH}_2=\text{CH}(\text{CH}_2)_9\text{COONa}$.

Properties: White powder; decomposes above 200°C ; limited solubility in most organic solvents; soluble in water. Combustible.

Uses: Bacteriostat and fungistat in cosmetics and pharmaceuticals.

sodium uranate. See sodium diuranate.

sodium vanadate. See sodium orthovanadate; sodium pyrovanadate; sodium metavanadate.

sodium para-vinylbenzene sulfonate. See sodium styrene sulfonate.

sodium warfarin (sodium(3-alpha-acetonylbenzyl)-4-hydroxycoumarin) $\text{C}_{19}\text{H}_{15}\text{NaO}_4$. See warfarin.

sodium xanthate. See sodium ethylxanthate.

sodium xanthogenate. See sodium ethylxanthate.

sodium xylenesulfonate (dimethylbenzenesulfonic acid, sodium salt) $(\text{CH}_3)_2\text{C}_6\text{H}_3\text{SO}_3\text{Na} \cdot \text{H}_2\text{O}$.

Use: Hydrotropic solvent, used in detergents.

sodium zinc hexametaphosphate. See "Calgon Composition TG." See also sodium metaphosphate.

sodium zirconium glycolate $\text{NaH}_2\text{ZrO}(\text{H}_2\text{COCO})_2$.

Properties: Clear, light straw-colored solution, sp. gr. 1.28–1.30, containing 35.7–38.6% solids; 12.5–13.5% ZrO_2 .

Uses: Deodorant; astringent; germicide; sequestrant; fire retardant.

sodium zirconium lactate $\text{NaH}_2\text{ZrO}(\text{CH}_3\text{CHOCO})_2$.

Properties: Clear, straw colored solution, sp. gr. 1.28–1.30, containing 12.5–13.5% ZrO_2 , equivalent to 42.5–45.9% sodium zirconium lactate; pH 7.5–8.0.

Uses: Deodorant and antiperspirant.

sodium zirconium sulfate. See zirconium sodium sulfate.

softener (1) A substance used when dry powders are added to a polymeric material (e.g., rubber or plastic) to reduce the friction of mechanical mixing and to facilitate subsequent processing. They exert both lubricating and dispersing action, often by means of emulsification. Examples are vegetable oils, asphaltic materials, and stearic acid, the latter being especially effective with carbon black. It is difficult to distinguish precisely between softeners and plasticizers (q.v.); in general, softeners do not enter into chemical combination with the polymer, and their softening effect tends to be temporary.

(2) A fatliquoring agent (q.v.) used to soften leather.

(3) A sulfonated oil, fatty alcohol, or quaternary ammonium compound used in textile finishing to impart superior "hand" to the fabric and facilitate mechanical processing.

(4) A substance that reduces the hardness of water by removing or sequestering calcium and magnesium ions; among those used are various sodium phosphates and zeolites (q.v.). See water, hard.

"Softener 64."⁷³ Trademark for a fatty amide used as a cationic softener for textiles.

softwood. In papermaking terminology, an arbitrary name for the wood from coniferous trees (pine, spruce, fir, hemlock), regardless of the hardness or softness of the wood itself. Softwoods are used for almost all commercial grades of paper. See also paper pulp.

soil. (1) A mixture of inorganic matter derived from weathered rocks (about 50%) and organic components resulting from decay of prior vegetation (5%). Eight elements are present in the inorganic component in excess of 1% (oxygen, silicon, aluminum, iron, calcium, potassium, magnesium and sodium), most of which are in the ionized state. Water and air are also present, either in the voids between the particles or adsorbed on their surfaces. Many other elements occur in lower percentages including trace elements (q.v.) in concentrations of less than 1000 ppm. Some of these, e.g., boron (about 20 ppm) are essential for plant nutrition. Both nitrogen and phosphorus are associated with the organic content. The concentration of these is a fraction of 1%, respectively, but they play a vital part in plant and animal life. The pH of soils varies widely with location; some are as low as pH 4.5 (very acid) and others as high as pH 10 (strongly alkaline). For most crops the pH ranges around the neutral point (6.5-7.5). Texturally, soils are classified on the basis of their content of sand, silt, and clay. Those having 45-50% sand and 20-28% clay are called loams; those with over 50% sand are called sandy; and those with over 28% clay are in the clay group. Technologists consider soil as being made up of layers, known as horizons, each having a characteristic composition and physical properties; the spectrum of these horizons is called the soil profile. Organic matter is usually excluded from the profile.

(2) In textile literature any foreign matter present in or on fiber or fabric, i.e., dirt, oil, grease, etc. These are usually removable by the action of soap, synthetic detergents, or organic solvents.

soil conditioner. (1) A synthetic long-chain organic molecule having carboxyl groups along the chain whose charges react with the positive charges on the soil particles (aluminum and iron). The conditioners affect the anion exchange capacity of a soil.

(2) Loosely, any material added to topsoil to reduce acidity (lime) and promote growth (bone meal).

"**Soilfume.**"⁵⁵ Trademark for a soil fumigant whose active ingredient is ethylene dibromide.

Hazard: See ethylene dibromide.

sol. See solution, colloidal.

solan. Generic name for 3'-chloro-2-methyl-para-valerolulidide; (N-(3-chloro-4-methylphenyl)-2-methylpentanamide)

Properties: Solid; m.p. 86°C; insoluble in water; soluble in pine oil, diisobutyl ketone, isophorone, and xylene. Low toxicity; combustible.

Use: Herbicide.

solanine. A toxic alkaloid formed in potatoes and some other root crops on long exposure to light during storage. Chlorophyll may also be formed.

"**Solar.**"³⁰⁷ Trademark for a series of phosphotungstic and phosphomolybdic lakes in dispersed powder form. Use: Coloring various grades of paper.

solar cell. A device for converting the radiant energy of the sun into electrical or thermal energy for use in power generation and heating and cooling of buildings. There are two basic types. One type utilizes a p-type semiconductor, such as a ribbon of pure silicon, the energy conversion being electrical in nature. Selenium and cadmium sulfide can also be used. The other type is a heat-collecting cell which may be 3 feet wide by 6 or more feet long, utilizing either a circulating gas or glass plates and an aluminum absorber plate. A variation of this is the parabolic concentrator developed at Argonne National Laboratory, consisting of channels made of epoxy resin with vapor-deposited aluminum surface; each wall of the channels is a portion of a parabolic surface. Prototypes of these are under construction. See also energy converter.

solar energy. See solar cell; energy converter; chlorophyll.

"**Solastral.**"²⁴³ Trademark for phthalocyanine pigments.

"**Solcut.**"³²⁰ Trademark for a self-emulsifying superfatted soluble cutting fluid for difficult nonferrous metal machining operations.

solder. A low-melting alloy, usually of the lead-tin type, used for joining metals at temperatures below 800°F. The solder acts as an adhesive, and does not form an intermetallic solution with the metals being joined. See also brazing; welding.

"**Soledon.**"³²⁵ Trademark for a series of leuco vat esters.

"**Solfast.**"¹⁴¹ Trademark for a series of pigments used in paints, printing inks, textiles, paper, etc. They are stable to sunlight. The colors offered are blue, violet, green, red and yellow.

"**Solganal.**"³²¹ Trademark for aurothioglucose (q.v.).

solid. Matter in its most highly concentrated form, i.e., the atoms or molecules are much more closely packed than in gases or liquids, and thus more resistant to deformation. The normal condition of the solid state is crystalline structure—the orderly arrangement of the constituent atoms of a substance in a framework called a lattice. (See crystal). Crystals are of many types, and normally have defects and impurities that profoundly affect their applications, as in semiconductors (q.v.). The geometric structure of solids is determined by x-rays, which are reflected at characteristic angles from the crystal lattices, which act as diffraction gratings. This is the science of crystallography (q.v.).

Some materials that are physically rigid, such as glass, are regarded as highly viscous liquids because they lack crystalline structure. All solids can be melted (i.e., the attractive forces acting between the crystals are disrupted) by heat, and are thus converted to liquids. For ice, this occurs at 32°F; for some metals the melting point may be as high as 6000°F.

solids. The nonliquid portion of a suspension or emulsion, e.g., a paint of low solids content.

solid state chemistry. Study of the exact arrangement of atoms in solids, especially crystals, with particular emphasis on imperfections and irregularities in the electronic and atomic patterns in a crystal, and the effects of these on electrical and other properties. See also crystal; semiconductor; impurity.

"**Solinox.**"⁶⁴ Trademark for a series of chemically treated soybean oils.

Uses: Lacquers; coated fabrics; artificial leather.

"Solithane."²⁷ Trademark for liquid urethane prepolymer which can be cured to produce solid materials of varying degrees of hardness and flexibility.

Uses: For casting and molding mechanical components, sheets, tubing, other shapes; coatings; potting and encapsulation.

"Solka."²³¹ Trademark for a purified wood cellulose.

"Solka-Floc."²³¹ Trademark for powdered cellulose products derived by mechanical comminution of purified wood pulp. Available in various fiber lengths including dense free-flowing powders. Combustible. Properties: White; brightness up to 92; particle size 40 to 165 microns; moisture 5-7%; sp. gr. 1.58; apparent density 9-34 lbs/cu ft; relatively inert to acids, alkalies and solvents; practically ashless; bone dry, 99.5+% cellulose. Soft, adsorbent and non-abrasive. Containers: Multiwall bags.

Uses: Filter aid; raw material for cellulose derivatives, filler in rubber; component in welding rod coatings; inert bulking agent in food products.

"Solo."⁷⁹ Trademark for petroleum-insoluble resin. Available in solid, flake and pulverized forms.

Uses: Adhesives; asphalt emulsions; core binders; electrical insulating compounds, fiberboard panels, insulation batt manufacture; oil emulsions; sulfur grinding.

"Solox."¹⁹² Trademark for a general-purpose solvent formulation comprised of specially denatured alcohol with low percentages of solvent modifiers. Available in regular and anhydrous grades.

"Solozone."²⁸ Trademark for a technical grade of sodium peroxide.

"Solprene."³⁰³ Trademark for a solution of polymers of butadiene/styrene.

Uses: Footwear, wire and cable, sponge, floor tile and cove base, and other molded and extruded goods.

"Solricin" 135.²⁰² Trademark for 35% aqueous solution of potassium ricinoleate. Mild germicide; synergizes phenol coefficients of disinfectants.

"Solricin" 285.²⁰² Trademark for an 85% aqueous solution of ammonium ricinoleate; used as a rust-proofing agent.

"Solros."⁷⁹ Trademark for a heat-treated "FF" wood rosin.

Uses: Adhesive tape; artificial Burgundy pitch; belt dressings; branding paint; core oil; electric insulating compounds; pitch; printing ink; rock wool; roofing cement; rubber cement; shellac diluent; smoking molds; spirit varnishes; sticky fly paper; synthetic rosin oil; tree banding; Venice turpentine; wire coating compounds.

"Soltrol"³⁰³ Trademark for a series of odorless mineral spirits.

solubility. The ability or tendency of one substance to blend uniformly with another, e.g., solid in liquid, liquid in liquid, gas in liquid, gas in gas. Solids vary from 0 to 100% in their degree of solubility in liquids, depending on the chemical nature of the substances; to the extent that they are soluble, they lose their crystalline form and become molecularly or ionically dispersed in the solvent to form a true solution. Examples are sugar/water, salt/water. Liquids and gases are often said to be miscible in other liquids and gases, rather than soluble. Thus nitrogen, oxygen,

and carbon dioxide are freely miscible in each other, and air is a solution (uniform mixture) of these gases.

The physical chemistry of solubility is an extremely complex mathematical subject in which the principles of electrolytic dissociation, diffusion and thermodynamics play a controlling part. Raoult's law and Henry's law are also involved. See also miscibility; solution, true.

soluble oil. An oil (also called emulsifying oil) which, when mixed with water, produces milky emulsions. In some soluble oils the emulsion is so fine that instead of milky solutions in water, amber colored transparent solutions are formed. Typical examples are sodium and potassium petroleum sulfonates.

Uses: Metal cutting lubricants; textile lubricants; metal boring lubricants; emulsifying agents.

soluble starch. See starch, modified.

"Solulan."⁴⁹³ Trademark for ethoxylated derivatives of lanolin and lanolin components. Some are also acetylated. "Solulan" C-24 is a polyethoxylated cholesterol. Uses: Pharmaceuticals and cosmetics.

"Solu-Rez."¹⁷⁰ Trademark for a modified polyvinyl resin emulsion designed as multi-purpose packaging adhesive.

solute. One or more substances dissolved in another substance, called the solvent; the solute is uniformly dispersed in the solvent in the form of either molecules (sugar) or ions (salt), the resulting mixture comprising a solution. See solution (true); solvent.

solution (true). A uniformly dispersed mixture, at the molecular or ionic level, of one or more substances (the solute) in one or more other substances (the solvent). These two parts of a solution are called phases (q.v.). Common types are:

liquid/liquid: alcohol/water.

solid/liquid: salt/water.

solid/solid: carbon/iron.

Solutions that exhibit no change of internal energy on mixing and complete uniformity of cohesive forces are called *ideal*; their behavior is described by Raoult's Law. Solutions are involved in most chemical reactions, refining and purification, industrial processing and biological phenomena.

The proportion of substances in a solution depends on their limits of solubility. The solubility of one substance in another is the maximum amount that can be dissolved at a given temperature and pressure. A solution containing such a maximum amount is *saturated*. A state of supersaturation can be created, but such solutions are unstable and may precipitate spontaneously.

solution, colloidal. A liquid colloidal dispersion, often called a sol. Since colloidal particles are larger than molecules, it is strictly incorrect to call such dispersions solutions; however, this term is widely used in the literature.

Note: Wolfgang Ostwald stated, "... There are no sharp differences between mechanical suspensions, colloidal solutions, and molecular [true] solutions. There is a gradual and continuous transition from the first through the second to the third." See also colloid chemistry.

solutrope. A ternary mixture having two liquid phases between which one component is distributed in an apparent ratio varying with concentration from less than one to more than one. In other words, the solute

may be selectively dissolved in one or the other of the phases or solvents depending on the concentration. This phenomenon has been compared to azeotropic behavior.

"Solvat."²⁴³ Trademark for leuco esters of vat dyes used for wool, cellulose and synthetic fibers.

solvation. In the parlance of colloid chemistry, the adsorption of a microlayer or film of water or other solvent on individual dispersed particles of a solution or dispersion. The term "solvated hulls" has been used to describe such particles. It is also applied to the action of plasticizers on resin dispersions in plastisols (q.v.).

"Solvatone."²¹⁴ Trademark for mixture of low boiling alcohols and ketones, including isopropanol and acetone.

Solvay process (ammonia soda process). Manufacture of sodium carbonate (soda ash, Na_2CO_3) from salt, ammonia, carbon dioxide and limestone by an ingenious sequence of reactions involving recovery and reuse of practically all the ammonia and part of the carbon dioxide. Limestone is heated to produce lime and carbon dioxide. The latter is dissolved in water containing the ammonia and salt, with resultant precipitation of sodium bicarbonate. This is separated by filtration, dried and heated to form normal sodium carbonate. The liquor from the bicarbonate filtration is heated and treated with lime to regenerate the ammonia. Calcium chloride is a major byproduct.

Note: Because this process requires much energy and pollutes streams and rivers with chloride effluent, its continued use in its present form is questionable. Many plants using it have closed, future production being obtained from the natural deposits in western U.S.

"Solvenol."²⁶⁶ Trademark for a group of monocyclic terpene hydrocarbons with minor amounts of terpene alcohols and ketones.

Uses: General solvent; rubber reclaiming.

solvent. A substance capable of dissolving another substance (solute) to form a uniformly dispersed mixture (solution) at the molecular or ionic size level. Solvents are either polar (high dielectric constant) or non-polar (low dielectric constant). Water, the most common of all solvents, is strongly polar (dielectric constant 81), but hydrocarbon solvents are non-polar. Aromatic hydrocarbons have higher solvent power than aliphatics (alcohols). Other organic solvent groups are esters, ethers, ketones, amines and nitrated and chlorinated hydrocarbons.

The chief uses of organic solvents are in the coatings field (paints, varnishes and lacquers), industrial cleaners, printing inks, extractive processes, and pharmaceuticals. Since many solvents are flammable and toxic to varying degrees, they contribute to air pollution and fire hazards. For this reason their use in coatings and cleaners is expected to decline rather sharply, perhaps by as much as 75% by 1980. For specific properties and uses, see individual compound.

solvent, aprotic. A solvent that cannot act as a proton acceptor or donor, i.e., as an acid or base.

solvent drying. Removal of water from metal surfaces by means of a solvent that displaces it preferentially, as on precision equipment, electronic components, etc. Examples of solvents used are acetone, 1,1,2-trichloro-1,2,2-trifluoroethane, 1,1,1-trichloro-ethane.

solvent dyeing. See dyeing, solvent.

solvent extraction. A separation operation which may involve three types of mixtures: (a) a mixture composed of two or more solids, such as a metallic ore; (b) a mixture composed of a solid and a liquid; (c) a mixture of two or more liquids. One or more components of such mixtures are removed (extracted) by exposing the mixture to the action of a solvent in which the component to be removed is soluble. If the mixture consists of two or more solids, extraction is performed by percolation of an appropriate solvent through it. This procedure is also called leaching, especially if the solvent is water; coffee-making is an example.

In liquid-liquid extraction one or more components are removed from a liquid mixture by intimate contact with a second liquid which is itself nearly insoluble in the first liquid and dissolves the impurities and not the substance that is to be purified. In other cases the second liquid may dissolve, i.e. extract, from the first liquid, the component that is to be purified, and leave associated impurities in the first liquid. Liquid-liquid extraction may be carried out by simply mixing the two liquids with agitation, and then allowing them to separate by standing. It is often economical to use countercurrent extraction, in which the two immiscible liquids are caused to flow past or through one another in opposite directions. Thus fine droplets of heavier liquid can be caused to pass downward through the lighter liquid in a vertical tube or tower.

The solvents used vary with the nature of the products involved. Widely used are water, hexane, acetone, isopropyl alcohol, furfural, xylene, liquid sulfur dioxide, and tributyl phosphate. Solvent extraction is an important method of both producing and purifying such products as lubricating and vegetable oils, pharmaceuticals, and nonferrous metals.

solvent, latent (co-solvent). An organic liquid that will dissolve nitrocellulose in combination with an active solvent. Latent solvents are usually alcohols and are used widely in nitrocellulose lacquers in a ratio of 1 part alcohol to 2 parts active solvent.

solvent naphtha. See naphtha (2b).

solvent refining. See solvent extraction.

Solvent Yellow 3. See ortho-aminoazotoluene.

"Solvesso."⁵¹ Trademark for aromatic petroleum solvents. Grades available include "Solvesso Toluene," "Solvesso Xylene," "Solvesso 100," and "Solvesso 150."

"Solvofen" HM.³⁰⁷ Trademark for a substituted pyrrolidone.

Properties: Light yellow liquid, b.p. 202°C.

Uses: Cleaning agent for rubber and metal padder or print rollers in textile processing; woolen felts and other paper mill equipment. Dispersing aid for organic and inorganic pigments for plastic and rubber systems.

solvolysis. A reaction involving substances in solution, in which the solvent reacts with the dissolved substance (solute) to form a new substance. Intermediate compounds are usually formed in this process. See also hydrolysis.

"Solwyte."⁷⁹ Trademark for a heat-treated tall oil rosin. Uses: Rosin esters; rosin-modified synthetic resins; paper size.

soman (methylphosphonofluoridic acid, 1,2,2-trimethylpropyl ester) $(\text{CH}_3)_3\text{CCH}(\text{CH}_3)\text{OPF}(\text{O})\text{CH}_3$. A nerve gas.

Properties: Colorless liquid; evolves odorless gas; b.p. 167°C; f.p. -70°C; sp. gr. 1.026 (20°C).

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. May be fatal on short exposure. Cholinesterase inhibitor. No longer manufactured.

somatotropic hormone (STH; somatotropin). Hormone secreted by the anterior lobe of the pituitary. It causes an increase in general body growth and also affects carbohydrate and lipid metabolism.

"Sono-Jell."⁴⁵ Trademark for a balanced blend of white mineral oils and waxes of U.S.P. purity.
Uses: Waterless cleaning creams; ointments.

sonolysis. The breaking-up (molecular fragmentation) of molecules by ultrasonic radiation. Examples: sonolysis in pure water produces hydrogen atoms, hydroxyl radicals, molecular hydrogen, oxygen and hydrogen peroxide; acetonitrile, in an argon atmosphere, produces molecular hydrogen, nitrogen, and methane.

"Sonostat."⁴⁹⁸ Trademark for a series of antistatic agents based on nitrogenous compounds for use on natural and synthetic fibers.

"Sonowax."⁴⁵ Trademark for a series of wax emulsions based on microcrystalline wax for use with resins or as top finish on various textile fabrics.

"Sopanox."⁴⁸ Trademark for ortho-tolyl biguanide (q.v.).

"Sorapon" SF-78.³⁰⁷ Trademark for an anionic surfactant, sodium alkylaryl sulfonate; 85% active.

sorb. See sorption.

sorbic acid (2,4-hexadienoic acid)

$\text{CH}_3\text{CH:CHCH:CHCOOH}$.

Properties: White, crystalline solid. M.p. 134.5°C; b.p. 228°C (dec), 153°C (50 mm); flash point (open cup) 260°F. Slightly soluble in water; soluble in many organic solvents. Combustible; low toxicity.

Derivation: Trimerization of acetaldehyde and catalytic air oxidation of the resulting hexadienal. Found in berries of mountain ash.

Grade: F.C.C.; technical.

Containers: Glass bottles; fiber cans.

Uses: Fungicide; food preservative; copolymerization; upgrading of drying oils; cold rubber additive; intermediate for plasticizers and lubricants.

sorbide (dianhydrosorbitol) $\text{C}_6\text{H}_8\text{O}_2(\text{OH})_2$. Generic name for anhydrides (dicyclic ether dihydric alcohols) derivable from sorbitol (q.v.) by removal of two molecules of water. The name is also applied to specific commercial varieties.

"Sorbit."²¹⁹ Trademark for sodium dibutyl naphthalene sulfonate ($\text{C}_{10}\text{H}_7\text{SO}_3\text{Na}$), 65% active.

Properties: Light tan flakes. Soluble in water, polar organic solvents, strong electrolytes. Stable to acids and alkalis.

Uses: Wetting agent and penetrant; hydrotrope; dispersant and thinning agent; emulsifier; detergents.

sorbitan (monoanhydrosorbitol; sorbitol anhydride) $\text{C}_6\text{H}_8\text{O}(\text{OH})_4$. Generic name for anhydrides (cyclic ether tetrahydric alcohols) derivable from sorbitol (q.v.) by removal of one molecule of water.

sorbitan fatty acid esters. Mixtures of partial esters of sorbitol and its anhydrides with fatty acids.

Properties: Sorbitan monolaurate and sorbitan mono-

oleate are amber liquids; sorbitan monostearate, sorbitan monopalmitate and sorbitan tristearate are cream-colored waxy solids with slight odor and bland taste. Sp. gr. of both liquid and solid esters is approx. 1.0 (25°C); m.p. of solid esters is approx. 54°C. They are insoluble in water; somewhat soluble in organic solvents. Low toxicity; combustible. See also "Span"; "Tween."

Derivation: Esterification of sorbitol with fatty acids. Grades: Technical; F.C.C. (for sorbitan monostearate). Uses: Emulsifiers and stabilizers in foods, cosmetics, drugs, textiles; plastics; agricultural chemicals. See also polysorbate.

sorbitol (D-sorbite; D-sorbitol; hexahydric alcohol) $\text{C}_6\text{H}_8(\text{OH})_6$.

Properties: White, odorless, crystalline powder; hygroscopic; faint, sweet taste. Soluble in water, glycerol, and propylene glycol; slightly soluble in methanol, ethanol, acetic acid, phenol and acetamide. Almost insoluble in most other organic solvents. Sp. gr. 1.47 (-5°C); m.p. (metastable form) 93°C; (stable form) 97.5°C. Approved by FDA for food use.

Derivation: By pressure hydrogenation of dextrose with nickel catalyst. Occurs in small amounts in various fruits and berries.

Grades: Crystals; technical; 70% aqueous solution (U.S.P.); resin; powder; F.C.C. (solid and solution). Containers: Drums; tank cars; tank trucks.

Uses: Ascorbic acid fermentation. In solution form, for moisture-conditioning of cosmetic creams and lotions, toothpaste, tobacco, gelatin; bodying agent for paper, textiles, and liquid pharmaceuticals; softener for candy; sugar crystallization inhibitor; surfactants; urethane resins and rigid foams; plasticizer; stabilizer for vinyl resins; varnishes and lacquers; food additive (sweetener, humectant, emulsifier, thickener, anticaking agent).

sorbitol anhydride. See sorbitan.

"Sorbo."⁸⁹ Trademark for 70% sorbitol solution.

"Sorbo-Cell."²⁴⁷ Trademark for a chemical-coated diatomite filter aid used for selectively removing traces of oil from oil-in-water emulsions. Effective for removing other trace components from free or emulsified systems.

Use: Conditioning of boiler feed water.

L(-)-sorbose $\text{HOCH}_2\text{CO}(\text{CHOH})_3\text{CH}_2\text{OH}$.

Properties: White crystalline powder; sweet taste; m.p. 159-161°C; soluble in water; slightly soluble in ethyl or isopropyl alcohol, insoluble in ether, acetone, benzene, chloroform. Combustible; nontoxic.

Derivation: From sorbitol by submerged culture aerobic fermentation.

Grades: Technical; reagent.

Uses: Manufacture of ascorbic acid (vitamin C); preparation of special diets and media for the study of metabolism in animals and microorganisms.

Sorel cement. See magnesium oxychloride cement.

sorghum. A cereal plant cultivated in the temperate zones; its stems are rich in sucrose and can be processed in much the same way as sugar-cane and used as a source of sugar. It is grown in the U.S. in the Midwest, especially Texas.

"Soromine."³⁰⁷ Trademark for a series of fiber softening agents.

AT. Complex fatty amido compound; 20% active; amphoteric.

CT-75. Dimethyldistearyl quaternary ammonium chloride; cationic.

CAZ-75. Complex polyalkyl amido imidazolinium sulfate; cationic.

sorption. A surface phenomenon which may be either absorption or adsorption, or a combination of the two. The term is often used when the specific mechanism is not known.

sorrel salt. See potassium binoxalate.

sour (1) Any substance used in textile or laundry operations to neutralize residual alkali or decompose residual hypochlorite bleach. The commonly used sour is sodium bifluoride and sodium fluosilicate. (2) Contaminated with sulfur compounds, e.g., gasoline or natural gas. See doctor treatment. (3) Taste characteristic of an acidic or fermented substance.

"Source."⁵²³ Trademark for a biconstituent fiber composed of about 70% nylon and 30% polyester by weight. The fiber is a dispersion of polyester fibrils within and oriented to the axis of the nylon fiber. Chief use is for luxury carpet fiber.

"Soyagel."²²¹ Trademark for a catalytically polymerized soybean oil, for use in paints, enamels, primers and sealers.

soybean flour. A fine-ground powder having a particle size of 100-mesh or less, made by steaming soybeans to inactive enzymes, followed by removal of hulls and mechanical grinding. It contains from 40 to 50% protein, about 20% fat and 5% moisture. Defatted flours are made by extraction with hexane to remove the oil. The flakes produced are used chiefly for animal feeds, but the full-fat flour has become an increasingly important factor in high-protein food products, especially textured proteins and meat analogs.

soybean meal. The crushed residue from the extraction of soybeans. Extraction by the hydraulic or expeller process produces normally a meal with approximately 6% residual oils while from the solvent process approximately 1% residual oil. Typical analysis: crude protein 43%; crude fiber 5.5%; nitrogen-free extract 30%; ash 6%; oil content between 1 and 6%. Total digestible nutrients approximate 75%.

Containers: Bulk or bags.

Use: Animal feeds; adhesives; medium for bacitracin production.

soybean oil (soya bean oil; Chinese bean oil; soy oil). Properties: Pale yellow, fixed drying oil. Soluble in alcohol, ether, chloroform and carbon disulfide. Sp. gr. 0.924-0.929; m.p. 22-31°C; refractive index 1.4760-1.4775; solidifying point -15 to -8°C; Hehner value 94-96; saponification value 190-193; iodine value 137-143. Flash point 540°F; combustible; non-toxic. Moderate spontaneous heating. Autoignition temp. 833°F.

Derivation: Expression and solvent extraction of soybeans.

Method of purification: Oil to be used for edible purposes is bleached with fuller's earth; oil for technical use is purified with chemicals.

Grades: Coast; refined (salad); crude; foots (for soapstock); clarified.

Containers: Drums; tank cars.

Uses: Soap manufacture; high-protein foods; paints and varnishes; cattle feeds; margarine and salad dressings; printing inks; source of nylon 9; plasticizer (epoxidized); alkyl resins.

Note: Soybean oil is the most widely used vegetable oil for both edible and industrial use in the U.S.

space velocity. The volume of gas or liquid, measured at specified temperature and pressure, (usually standard conditions) passing through unit volume in unit time. Used in comparing flow processes involving different conditions, rates of flow, and sizes or shape of containers.

spalling. Chipping an ore for crushing; or the cracking, breaking or splintering of materials due to heat.

"Span."⁸⁹ Trademark for each member of a series of general-purpose emulsifiers and surface-active agents. They are fatty acid partial esters of sorbitol anhydrides (or sorbitan). Generally insoluble in water and soluble in most organic solvents.

spandex. Generic name for a manufactured fiber in which the fiber-forming substance is a long chain synthetic polymer comprised of at least 85% of a segmented polyurethane (Federal Trade Commission). Imparts elasticity to garments such as girdles, socks, special hosiery. See, for example, "Lycra."

spar. (1) A type of crystalline material such as Iceland spar or feldspar, usually containing calcium carbonate or an aluminum silicate; fluorspar is calcium fluoride. Iceland spar has unique optical properties.

(2) A weather-resistant varnish originally used for coating wooden decks of ships, which may be the reason for its name. See spar varnish.

spar, Greenland. See cryolite.

spar, heavy. See barite.

spar, Iceland. See calcite.

"Sparine" Hydrochloride.²⁴ Trademark for promazine hydrochloride (q.v.).

sparking metal. See pyrophoric alloy.

"Spark-L."²¹² Trademark for a liquid pectinase enzyme used to depectinize apples at low temperatures.

spar, satin. See calcite; gypsum.

spar varnish. A durable, water-resistant varnish for severe service on exterior exposure. It consists of one or more drying oils (linseed, tung or dehydrated castor oil); one or more resins (rosin, ester gum, phenolic resin or modified phenolic resin); one or more volatile thinners (turpentine or petroleum spirits), and driers (linoleates, resinates or naphthenates of lead, manganese and cobalt). It is classed as a long-oil varnish and generally consists of 45-50 gallons of oil to each 100 lb of resin. See also varnish.

SPE. Abbreviation for Society of Plastics Engineers (q.v.).

spearmint oil.

Properties: Colorless to pale yellowish liquid; characteristic odor and taste. Soluble in alcohol, ether, and chloroform. Sp. gr. 0.930-0.940; optical rotation -48° to -59°; refractive index about 1.4910 (20°C). Combustible; nontoxic.

Chief known constituents: Carvone (40-60%); linalool; pinene.

Derivation: By distillation of spearmint leaves.

Grades: Technical; N.F.; F.C.C.

Containers: Bottles; tins; drums.

Uses: Flavoring (foods, medicine, chewing gum); source of carvone.

specific gravity. The weight of a given volume of any substance compared with the weight of an equal volume of a reference material, namely, water for solids and liquids and air for gases. The weight of one cubic centimeter of water is taken as 1 gram; hence, if the density of a given substance is 5 grams per cc, its specific gravity is 5/1, or 5. Since weights vary with temperature, it is necessary to specify both temperatures involved, except for rough or approximate values. Thus the specific gravity of alcohol should be given as 0.7893 at 20/4°C, the first temperature referring to the alcohol and the latter to the water. At 15.56°C the specific gravity of alcohol is 0.816. See also API gravity; density.

specific heat. The ratio of the heat capacity of a substance to the heat capacity of water; or the quantity of heat required for a one degree temperature change in a unit weight of material. Commonly expressed in Btu/lb/°F or in cal/g/°F. For a gas the specific heat at constant pressure is greater than that at constant volume by the amount of heat needed for expansion.

specific volume. The volume of unit weight of a substance, as cubic feet per pound, or gallons per pound, but more frequently milliliters per gram. The reciprocal of density.

specific weight. The weight per unit volume of a substance.

"SpectrAR."³²⁹ Trademark for a group of spectrophotometric-grade solvents that have been developed for the extremely high purity required by modern analytical techniques.

spectrophotometry. See absorption spectroscopy.

spectroscopy (instrumental analysis). A branch of analytical chemistry devoted to identification of elements and elucidation of atomic and molecular structure by measurement of the radiant energy absorbed or emitted by a substance in any of the wavelengths of the electromagnetic spectrum in response to excitation by an external energy source. The types of absorption and emission spectroscopy are usually identified by the wavelength involved, namely, gamma ray, x-ray, ultraviolet, visible, infrared and microwave. The technique of spectroscopic analysis was originated by Fraunhofer who in 1814 discovered certain dark (D) lines in the solar spectrum, which were later identified as characterizing the element sodium. In 1861 Kirchhoff and Bunsen produced emission spectra and showed their relationship to Fraunhofer lines. X-ray spectroscopy was utilized by Moseley (1912) to determine the precise location of elements in the Periodic system. Since then, still more sophisticated techniques have been developed, e.g., nuclear magnetic resonance (NMR) and dynamic reflectance spectroscopy. See also absorption spectroscopy; emission spectroscopy; infrared spectroscopy.

"Spectrosil."²²⁰ Trademark for a synthetic fused silica used in laboratory ware.

"Speedflow."²¹⁸ Trademark for diatomite filteraids, used in food, pharmaceutical, and industrial processing.

spelter. Relatively pure zinc as encountered in industrial operations such as galvanizing. Lead and iron are common impurities.

"Spen-Amm."⁵³³ Trademark for ammonia used for direct application.

"Spensol Green."⁵³³ Trademark for ammoniating solutions.

spent mixed acid. Mixed acid (q.v.) which has given up part of its nitric acid.

Hazard: Dangerous fire risk; strong irritant to tissue.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

spent oxide. See iron sponge, spent.

"Spargon."²⁴⁸ Trademark for a series of fungicides and seed protectants based on tetrachloro-para-benzoquinone.

spermaceti

Properties: White, unctuous, semitransparent, waxy solid; almost odorless and tasteless; becomes rancid on exposure. Soluble in ether, chloroform, carbon disulfide and hot alcohol; insoluble in water and cold alcohol. Sp. gr. 0.945; m.p. 42–50°C; refractive index about 1.4330; saponification no. 120–136; iodine no. 3–4.4. Combustible; Low toxicity.

Chief constituents: Cetyl palmitate, esters of lauric, myristic and stearic acids.

Derivation: Found in the head of the sperm whale; filtered under pressure to remove stearin, boiled with water and a small amount of caustic soda, following by repeated washings. Also made synthetically.

Grades: Technical; U.S.P.; as blocks or cakes.

Containers: 50-, 60-lb cases; bags.

Uses: Base for ointments, cerates and emulsions; manufacture of candles, soaps, cosmetics, laundry wax; finishing and lustering linens.

Note: See note under sperm oil.

sperm oil

Properties: Light yellow liquid; sp. gr. 0.8781–0.8835; flash point 428°F saponification number 123–147; iodine number 79.5–84; very low in free fatty acids. Soluble in chloroform, ether, and benzene. A monohydric fatty alcohol ester of fatty acids—not a triglyceride. One of the best natural lubricants known. Combustible; low toxicity.

Derivation: From the head cavity of the sperm whale. (Not the same as whale oil, q.v.).

Grades: Bleached winter; natural winter.

Containers: Drums, tank cars and trucks.

Uses: High-grade lubricating oil for precision machinery (watches, clocks and scientific instruments); fatliquoring leather; rust proofing; extreme pressure lubricants; automatic transmission fluids.

See also porpoise oil; jojoba oil.

Note: For animal conservation reasons, use of sperm oil has been prohibited in the U.S. since 1971.

Sperry process. An electrolytic process for the manufacture of lead carbonate, basic (white lead) from desilverized lead containing some bismuth. The impure lead forms the anode. A diaphragm separates anode and cathode compartments, and carbon dioxide is passed into the solution. Impurities, including bismuth, remain on the anode as a slime blanket.

sphalerite (blende; zinc blende) ZnS. Natural zinc sulfide, usually containing some cadmium, iron, and manganese.

Properties: Color yellow, brown, black, or red; luster resinous; hardness 3.5–4; sp. gr. 3.9–4.1; good cleavage; soluble in hydrochloric acid.

Occurrence: Missouri, Kansas, Oklahoma, Colorado, Montana, Wisconsin, Idaho; Australia; Canada; Mexico.

Uses: Most important ore of zinc; also a source of cadmium; phosphor; source of sulfur dioxide for production of sulfuric acid.

"Spheron."²⁷⁵ Trademark for pelleted channel carbon blacks for rubber.

sphingomyelin. Diaminophosphatides occurring primarily in nervous tissue and containing a fatty acid, phosphoric acid, choline, and sphingosine. They are soluble in hot absolute alcohol, and insoluble in ether, acetone, and water.

sphingosine (1,3-dihydroxy-2-amino-4-octadecene) $\text{CH}_3(\text{CH}_2)_{12}\text{CH}:\text{CHCHOHCH}(\text{NH}_2)\text{CH}_2\text{OH}$. Forms part of certain phosphatides, such as cerebrosides and sphingomyelins.

Properties: Waxy crystals; m.p. 67°C; soluble in ether.

SPI. Abbreviation for Society of the Plastics Industry (q.v.).

"Spiceal."³⁴² Trademark for water-miscible flavor concentrates from essential oils and oleoresin bases.

spike oil (lavender-spike oil; Spanish lavender oil; Spanish spike oil). See also lavandin oil, abrial.

Properties: Pale yellow essential oil; lavender-like odor; sp. gr. 0.893–0.909 (25°C); refractive index 1.4630–1.4680 (20°C); angular rotation -5° to $+5^\circ$. Soluble in some dilution between one and three volumes of 70% alcohol. Soluble in most fixed oils and propylene glycol; slightly soluble in glycerin and mineral oil.

Derivation: Steam distillation of flowers of *Lavandula latifolia*.

Grade: F.C.C., which requires not less than 40% and not more than 50% of total alcohols, calculated as linalool, and not less than 1.5% and not more than 3% esters, calculated as linalyl acetate.

Uses: Soaps; bath preparations; masking odor in sprays and disinfectants; flavoring agent.

spindle oil. Low-viscosity lubricating oil for lubrication of textile and other high-speed machinery.

spinel MgAl_2O_4 . A natural oxide of magnesium and aluminum, with replacement of magnesium by iron, zinc and manganese, and of aluminum by iron and chromium. There are also synthetic spinels, as magnesia-alumina or magnesia-chromia. Their structure is similar to ferrites (q.v.).

Properties: Color, various shades of red, grading to green, brown, and black; luster vitreous; hardness 8. There are many varieties.

Occurrence: New York, New Jersey, Massachusetts, Virginia, North Carolina; Ceylon; Thailand; Madagascar.

Uses: Crystallography; synthetic spinel is used as a refractory, and in electronic applications.

"Spiralloy."²⁶⁶ Trademark for glass- and other filament-wound, resin-bonded internal and external pressure vessels.

Uses: Rocket motor cases, underwater and space structures, pressure vessels, radomes, torpedo cases, booms and tubes.

spirits. An obsolescent and ambiguous term usually taken to mean the distilled essence of a substance. Mineral or petroleum spirits is a volatile hydrocarbon distillate similar to naphtha; in pharmacy, the

term refers to an alcoholic solution of volatile principles, e.g., spirits of ammonia, niter, camphor, etc. See also tincture.

spirocyclane. See spiropentane.

spironolactone $\text{C}_{24}\text{H}_{32}\text{O}_4\text{S}$. 17-Hydroxy-7 α -mercapto-3-oxo-17 α -pregn-4-ene-21-carboxylic acid γ -lactone 7-acetate.

Properties: Light cream-colored to light tan crystalline powder. Mild mercaptan-like odor; stable in air. Practically insoluble in water; soluble in ethyl acetate and alcohol; slightly soluble in methanol. M.p. 198–207°C (dec).

Grade: U.S.P.

Use: Medicine.

spiropentane (spirocyclane; cyclopropanespirocyclopropane $\text{H}_2\text{CH}_2\text{CCCH}_2\text{CH}_2$).

Properties: Colorless liquid; refractive index (n 20/D) 1.41220; sp. gr. 0.7551 (20/4°C); freezing point -107.05°C ; b.p. 39.03°C.

Derivation: Heating pentaerythrityl tetrabromide in ethanol with zinc dust.

spiro system. A structural formula consisting of two rings having one atom in common. Most bicyclic compounds, such as naphthalene, have two atoms in common. See, for example, spiropentane.

splitting, molecular, see hydrolysis; atomic, see fission.

spodumene $\text{LiAl}(\text{SiO}_3)_2$.

Properties: White, pale green, emerald green, pink or purple mineral; white streak; vitreous luster. Contains up to 8% lithium oxide with some replacement by sodium. Insoluble in acids. Sp. gr. 3.13–3.20; Mohs hardness 6.5–7.

Occurrence: United States (North Carolina, California, Massachusetts, South Dakota); Brazil; Madagascar.

Uses: Source of lithium; in ceramics and glass as a source of lithia and alumina.

sponge (1) **Metal:** A finely divided and porous form of a metal such as iron, platinum, or titanium. May be used in sponge form as a catalyst, or pressed into metal ingots. (2) **Plastic:** See cellular plastic; foam; rubber sponge. (3) **Natural:** Siliceous cells of the Porifera group of sessile sea animals.

sponge iron. See iron sponge.

"Spotleak."²⁰⁴ Trademark for a group of natural gas odorants.

1001. A mercaptan-sulfide blend that combines the high odor impact of tert-butyl mercaptan with the chemical stability of alkyl sulfides.

1003. A 100% synthetic mercaptan of tert-butyl mercaptan and isopropyl mercaptan.

1009. A 100% synthetic mercaptan mixture containing approximately 80% tert-butyl mercaptan.

"Spot-Lite."⁵²⁹ Trademark for nonradioactive phosphorescent paint, including an aerosol type and pressure-sensitive vinyl film. Both can be activated by any ambient light (sunlight, incandescent or fluorescent lamp) and are characterized by a high initial glow and a long and low afterglow; the dominant wavelength of both is about 5600Å.

sputtered coating. A protective metallic coating applied in a vacuum tube and consisting of metal ions emanating from a cathode and deposited as a film on objects within the tube. The process involves three phases: generation of metal vapor, diffusion of

the vapor, and its condensation. Paper, plastics, and similar materials can be coated in this way.

"Sprout Nip."¹⁷⁷ Trademark for potato sprout inhibiting formulation of isopropyl N-(3-chlorophenyl)-carbamate.

Grades: Aerosol; emulsifiable concentrate; 5% dust.

spun protein. See protein, textured.

"SQ Phosphate."⁵⁸ A glassy polyphosphate with high calcium-sequestering properties. Used in formulating industrial cleaning compounds.

squalane (perhydrosqualene; 2,6,10,15,19,23-hexamethyltetracosane; spinacane; dodecahydrosqualane) $C_{30}H_{62}$. A saturated hydrocarbon.

Properties: Colorless, odorless, tasteless liquid; miscible with vegetable and mineral oils, organic solvents and lipophilic substances. Nondrying, nonoxidizing, noncongealing. Sp. gr. 0.805–0.812 (20°C); b.p. approx. 350°C; f.p. approx. –38°C; refractive index 1.4520–1.4525 (n_D 20/D). Combustible.

Derivation: Hydrogenation of squalene; may occur naturally in sebum.

Containers: Bottles; drums.

Uses: High-grade lubricating oil; vehicle for externally applied pharmaceuticals and cosmetics; perfume fixative; gas chromatographic analysis.

squalene (spinacene; 2,6,10,15,19,23-hexamethyl-2,6,10,14,18,22-tetracosahexaene) $C_{30}H_{50}$. A natural raw material found in human sebum (5%), and in shark liver oil. An unsaturated aliphatic hydrocarbon (carotenoid) with six unconjugated double bonds.

Properties: Oil with faint odor; sp. gr. 0.858–0.860 (20°C); b.p. ca. 225°C; f.p. –60°C; refractive index 1.49–1.50; iodine no. 360–380; saponification value 0–5. Insoluble in water; slightly soluble in alcohol; soluble in lipids and organic solvents. Combustible. Grade: 90% min.

Uses: Biochemical and pharmaceutical research; a precursor of cholesterol in biosynthesis.

Sr Symbol for strontium.

"SR-173."²⁴⁵ Trademark for a silicone intermediate resin for reaction with alkyl coating resin constituents for air-dry and baking co-polymer high-performance coatings. Also available with special solvent to comply with air pollution requirements.

SRF black. Abbreviation for semireinforcing furnace black. See furnace black.

SS acid. See 8-amino-1-naphthol-5,7-disulfonic acid.

SSU. Abbreviation sometimes used for standard Saybolt Universal viscosity. The preferred abbreviation is now SUS. See Saybolt Universal viscosity.

"Stabilide."³²⁹ Trademark for potassium iodide stabilized with calcium stearate. Used in animal feeds.

"Stabilisal C."²³⁰ Trademark for an organic compound used as an antigellation agent for nitrocellulose-based bronzing lacquers and for stabilizing dipping lacquers.

"Stabilite."⁹⁴ Trademark for a series of antioxidants for natural and synthetic rubbers and latices.

N,N'-diphenylethylenediamine.

Alba. Di-o-tolyl ethylenediamine.

FLX. A mixture of N,N'-diphenylethylenediamine and diphenyl-p-phenylenediamine.

L. N,N'-diphenyl propylenediamine.

White. Polyalkylated phenol.

stabilizer. Any substance which tends to keep a compound, mixture, or solution from changing its form or chemical nature. Stabilizers may retard a reaction rate, preserve a chemical equilibrium, act as anti-oxidants, keep pigments and other components in emulsion form, or prevent the particles in a colloidal suspension from precipitating. See also inhibitor.

"Staclipse" Starches.⁴⁹² Trademark for specially processed acid-modified thin-boiling starches. Highly converted products having relatively high percentage of cold water-soluble fractions.

Uses: Finishes and binders in textile wet processing, adhesives, and paper industry for surface sizing, calender sizing and coating.

"Stacolloid" Gums.⁴⁹² Trademark for a group of noncongealing sizing and finishing agents derived from corn starch. Used in the sizing of spun synthetic, combed cotton, worsted yarns, and paper.

"Stacrylic" 115 Warp Size.⁴⁹² A pale, yellow, cloudy solution of an acrylate terpolymer used for sizing polyester filament yarns of all types.

"Stadex" Dextrins.⁴⁹² Trademark for products of the partial hydrolysis of corn starch produced by heating the starch in a dry atmosphere in the presence of acid. Uses: Adhesives, binders, thickeners, sizing ingredients, stabilizers, bodying agents and in edible products as carriers for color and flavor additives.

"Stafast."⁵⁰ Trademark for a naphthaleneacetic acid product (q.v.).

"Staflex."³⁶ Trademark for a series of vinyl plasticizers.

"Sta-fresh."⁵⁰ Trademark for a sodium bisulfite powder for preserving grass silage.

stain. (1) An organic protective coating similar to a paint, but with much lower solids content (pigment loading). Used for both exterior and interior coating of wood, furniture, flooring, etc. (2) Any compound used to color bacteria for microscopic examination, e.g., osmium tetroxide, phosphotungstic acid, uranyl acetate, and certain chromium compounds.

stainless steel. See steel, stainless.

"Staleydex" Dextrose.⁴⁹² Trademark for a crystalline dextrose produced by an enzyme conversion process. Several types of dextrose available varying from coarse particles to very fine dextrose monohydrate crystals, as well as liquid dextrose.

Uses: Canning, brewing, confections, beverages, prepared mixes, pharmaceuticals, chemicals, and other industrial uses.

"Stamere."⁴⁰⁶ Trademark for a series of edible hydrocolloids extracted from seaweeds. Various products are available which are standardized and recommended for particular applications:

standard cell. See Weston cell.

"Standfast Metal."⁶⁰ Trademark for a bismuth, lead, tin, and cadmium alloy. M.P. 158°F.

Uses: Liquid heat and pressure transfer medium.

stannic acid. See stannic oxide.

stannic anhydride. See stannic oxide.

stannic bromide (tin bromide; tin tetrabromide) $SnBr_4$. Properties: White, crystalline mass. Fumes when exposed to air. Soluble in water, alcohol, and carbon tetrachloride. Sp. gr. 3.3; b.p. 203°C; m.p. 31°C.

Hazard: Irritant to skin and eyes. Tolerance (as Sn), 2 mg per cubic meter of air.

Use: Mineral separations.

stannic chloride (tin chloride; tin tetrachloride) SnCl_4 .

Often sold in the form of the double salt with sodium chloride, $\text{Na}_2\text{SnCl}_6 \cdot \text{H}_2\text{O}$.

Properties: Colorless, fuming, caustic liquid, which water converts into a crystalline solid, $\text{SnCl}_4 \cdot 5\text{H}_2\text{O}$. Keep well stoppered! Sp. gr. 2.2788; f.p. -33°C ; b.p. 114°C . Soluble in cold water, alcohol, carbon disulfide and oil of turpentine; decomposed by hot water.

Derivation: Treatment of tin or stannous chloride with chlorine.

Grades: Technical; C.P.

Containers: Bottles; drums.

Hazard: Toxic, corrosive liquid. Tolerance (as Sn), 2 mg per cubic meter of air. Evolves heat on contact with moisture.

Uses: Electroconductive and electroluminescent coatings; textiles; perfume stabilization; manufacture of fuchsin; color lakes; ceramics; bleaching agent for sugar; stabilizer for certain resins; manufacture of blue print and other sensitized papers; other tin salts; bacteria and fungi control in soaps.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Legal label name, tin tetrachloride.

stannic chloride pentahydrate $\text{SnCl}_4 \cdot 5\text{H}_2\text{O}$.

Properties: White solid, m.p. 56°C ; soluble in water or alcohol.

Hazard: Toxic. Tolerance (as Sn), 2 mg per cubic meter of air.

Use: Substitute for anhydrous stannic chloride where the presence of water is not objectionable.

stannic chromate (tin chromate) $\text{Sn}(\text{CrO}_4)_2$.

Properties: Brownish yellow, crystalline powder. Partially soluble in water.

Derivation: Action of chromic acid on stannic hydroxide.

Hazard: Toxic. Tolerance (as Sn) 2 mg per cubic meter of air.

Use: Coloring porcelain and china.

stannic oxide (stannic anhydride; tin peroxide; tin dioxide; stannic acid) SnO_2 , or $\text{SnO}_2 \cdot n\text{H}_2\text{O}$.

Properties: White powder, anhydrous or containing variable amounts of water; sp. gr. 6.6–6.9; m.p. 1127°C ; sublimates at 1800 – 1900°C . Soluble in concentrated sulfuric acid, hydrochloric acid; insoluble in water. Low toxicity. Noncombustible.

Derivation: (a) Found in nature as in the mineral cassiterite (q.v.). (b) Precipitated from stannic chloride solution by ammonium hydroxide.

Grades: White, pure; white; gray; C.P.

Containers: Bottles; drums.

Uses: Tin salts; catalyst; ceramic glazes and colors; putty; perfume preparations and cosmetic; textiles (mordant, weighting); polishing powder for steel, glass, etc.; manufacture of special glasses.

stannic phosphide (tin phosphide) Sn_2P_2 , or SnP .

Properties: Silver white, hard mass or lumps. Soluble in acids. Sp. gr. 6.56; m.p., forms Sn_4P_3 at 415°C .

Derivation: By heating tin and phosphorus.

Hazard: Flammable, dangerous fire risk. Tolerance (as Sn), 2 mg per cubic meter of air.

Shipping regulations: (Rail) Flammable solids, n.o.s., Yellow label. (Air) Not acceptable.

stannic sulfide (artificial gold; mosaic gold; tin bronze; tin disulfide) SnS_2 .

Properties: Yellow to brown powder. Soluble in concentrated hydrochloric acid and alkaline sulfides; in-

soluble in water. Sp. gr. 4.42–4.60; m.p., decomposes at 600°C .

Derivation: (a) Action of sulfide on a solution of stannic chloride. (b) By heating tin amalgam with sulfur and ammonium chloride, distilling off the mercury sulfide and ammonium chloride.

Grades: Technical; reagent.

Containers: Glass bottles; boxes; drums.

Hazard: Irritant to skin and eyes. Tolerance (as Sn), 2 mg per cubic meter of air.

Uses: Imitation gilding; pigment.

"Stanno chlor."²⁸⁸ Trademark for anhydrous stannous chloride.

Uses: Immersion tinning; liquor finishing of wire; major ingredient in acid electro-tin and tin-nickel plating solutions; reducing agent; catalyst; analytical sensitizing of glass and plastics before metallizing; tanning agent; soldering flux; intermediate for tin chemicals; manufacture of color pigments, pharmaceuticals and sensitized paper.

stannous bromide (tin bromide; tin dibromide) SnBr_2 .

Properties: Yellow powder. Soluble in hydrochloric acid (dilute); soluble in water, alcohol, ether, and acetone. Oxidizes and turns brown in air. Sp. gr. 5.117 (17°C); b.p. 619°C ; m.p. 215°C .

Hazard: Skin irritant. Tolerance (as Sn), 2 mg per cubic meter of air.

stannous chloride (tin crystals; tin salt; tin dichloride; tin protochloride) (a) SnCl_2 (b) $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline mass, which absorbs oxygen from the air, being converted into the insoluble oxychloride. Soluble in water, alkalies, tartaric acid, and alcohol. (a) Sp. gr. 3.95 ($25/4^\circ\text{C}$); M.p. 246.8°C ; b.p. 652°C . (b) Sp. gr. 2.71; m.p. 37.7°C ; b.p., decomposes.

Derivation: By dissolving tin in hydrochloric acid.

Grades: Technical; C.P.; reagent; anhydrous; hydrated.

Containers: Bottles; drums.

Hazard: Toxic; irritant to skin. Tolerance (as Sn), 2 mg per cubic meter of air. Use in foods restricted to 0.0015%, calculated as tin.

Uses: Reducing agent in manufacture of chemicals, intermediates, dyes, polymers, phosphors; manufacture of lakes; textiles (reducing agent in dyeing, discharge in printing); tin galvanizing; reagent in analytical chemistry; medicine; silvering mirrors; re-vivification of yeast sown in must (accelerator); antisludging agent for lubricating oils; food preservative; stabilizer for perfume in soaps.

stannous chromate (tin chromate) SnCrO_4 .

Properties: Brown powder. Almost insoluble in water. Derivation: Interaction of stannous chloride and sodium chromate.

Hazard: Toxic. Tolerance (as Sn) 2 mg per cubic meter of air.

Use: Decorating porcelain.

stannous 2-ethylhexoate (stannous octoate; tin octoate) $\text{Sn}(\text{C}_8\text{H}_{15}\text{O}_2)_2$.

Properties: Light yellow liquid; insoluble in water, methanol; soluble in benzene, toluene, petroleum ether; hydrolyzed by acids and bases. Sp. gr. 1.25; Gardner color, 3 (max).

Hazard: Toxic. Tolerance (as Sn), 0.1 mg per cubic meter of air.

Uses: Polymerization catalyst for urethane foams; lubricant; addition agent; stabilizer for transformer oils.

stannous fluoride (tin fluoride; tin difluoride) SnF_2 .

Properties: White, lustrous, crystalline powder with bitter salty taste; m.p. 212 – 214°C . Practically in-

soluble in alcohol, ether, and chloroform; slightly soluble in water.

Grade: N.F.

Hazard: Toxic by ingestion; strong irritant to skin and tissue. Tolerance (as Sn), 2 mg per cubic meter of air.

Uses: Fluoride source in toothpastes; medicine.

Note: Stannous hexafluorozirconate is said to be more effective than the fluoride in preventing dental caries.

stannous octoate. See stannous 2-ethylhexoate.

stannous oleate (tin oleate) $\text{Sn}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Light yellow liquid; insoluble in water and methanol; soluble in benzene, toluene, petroleum ether; hydrolyzed by acids and bases.

Hazard: Toxic. Tolerance (as Sn), 0.1 mg per cubic meter of air. Absorbed by skin.

Uses: Polymerization catalyst; inhibitor.

stannous oxalate (tin oxalate) SnC_2O_4 .

Properties: Heavy, white, crystalline powder; sp. gr. 3.56; m.p., decomposes at ca. 280°C ; soluble in acids; insoluble in water and acetone.

Derivation: By the action of oxalic acid on stannous oxide.

Grades: Technical; C.P.; reagent.

Hazard: Toxic. Tolerance (as Sn), 0.1 mg per cubic meter of air. Absorbed by skin.

Uses: Dyeing and printing textiles; catalyst for esterification reactions.

stannous oxide (tin oxide; tin protoxide) SnO .

Properties: Brownish black powder; unstable in air. Reacts with acids and strong bases; insoluble in water.

Sp. gr. 6.3; m.p. 1080°C (600 mm), decomposes. A nuisance particulate. Low toxicity.

Derivation: By heating stannous hydroxide in a current of carbon dioxide.

Grades: Technical; C.P.

Containers: 1-, 5-lb bottles; wooden kegs.

Uses: Reducing agent; intermediate in preparation of stannous salts as used in plating and glass industries; pharmaceuticals; soft abrasive (putty powder).

stannous pyrophosphate $\text{Sn}_2\text{P}_2\text{O}_7$.

Properties: White, free-flowing crystals insoluble in water. Sp. gr. 4.009 (16°C).

Uses: Toothpaste additive.

stannous sulfate (tin sulfate) SnSO_4 .

Properties: Heavy, white or yellowish, crystals; soluble in water and sulfuric acid. Water solution decomposes rapidly. M.p. loses sulfur dioxide at 360°C .

Derivation: Action of sulfuric acid on stannous oxide. Containers: Fiber drums.

Hazard: Toxic. Tolerance (as Sn), 2 mg per cubic meter in air.

Uses: Dyeing; tin-plating; particularly for plating automobile pistons and steel wire.

stannous sulfide (tin monosulfide; tin protosulfide; tin sulfide) SnS .

Properties: Dark gray or black crystalline powder; sp. gr. 5.080; b.p. 1230°C ; m.p. 880°C . Soluble in concentrated hydrochloric acid (decomposes); insoluble in dilute acids and water.

Hazard: Toxic. Tolerance (as Sn), 2 mg per cubic meter in air.

Uses: Making bearing material; catalyst in polymerization of hydrocarbons; chemical reagent.

stannous tartrate (tin tartrate) $\text{SnC}_4\text{H}_4\text{O}_6$.

Properties: Heavy, white, crystalline powder; soluble in water, dilute hydrochloric acid.

Derivation: Action of tartaric acid on stannous oxide.

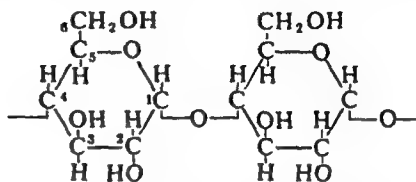

Hazard: Toxic. Tolerance (as Sn), 0.1 mg per cubic meter of air.

Uses: Dyeing and printing fabrics.

stannum. The Latin name for tin, hence the symbol Sn in chemical nomenclature.

staple. A cotton fiber, usually in reference to length, i.e., short or long staple cotton.

starch. A carbohydrate polymer having the repeating unit:

It is composed of about 25% amylose (anhydroglucopyranose units joined by glucosidic bonds) and 75% amylopectin, a branched-chain structure.

Properties: White, amorphous, tasteless powder or granules; various crystalline forms may be obtained, including microcrystalline. Irreversible gel formation occurs in hot water; swelling of granules can be induced at room temperature with such compounds as formamide, formic acid, and strong bases and metallic salts.

Occurrence: Starch is a reserve polysaccharide in plants (corn, potatoes, tapioca, rice, and wheat are commercial sources).

Grades: Commercial; powdered; pearl; laundry; technical; reagent; edible; U.S.P.

Uses: Adhesive (gummed paper and tapes, cartons, bags, etc.); machine-coated paper; textile filler and sizing agent; beater additive in papermaking; gelling agent and thickener in food products (gravies, custards, confectionery); oil-well drilling fluids; filler in baking powders (cornstarch); fabric stiffener in laundering; urea-formaldehyde resin adhesives for particle board and fiberboard; explosives (nitrostarch); dextrin (starch gum); chelating and sequestering agent in foods; indicator in analytical chemistry; anticaking agent in sugar; face powders; abherent and mold-release agent; polymer base (see next entry).

starch-based polymer. (1) A reactive polyol derived from a mixture of a starch with dibasic acids, hydrogen-donating compounds, and catalysts dissolved in water; the slurry is subjected to high temperatures and pressures, yielding a low-viscosity polymer in a 50% solids aqueous solution. A molecular rearrangement takes place, and the polymer formed is completely different from starch in structure and properties. It can be further reacted with acids, bases and cross-linking agents. Suggested uses are in high wet-strength papers, as binders in paper coatings, as moisture barriers in packaging, and as water-resistant adhesives.

(2) Yeast fermentation of starch to form a biodegradable plastic called pullulan (a trigluco polysaccharide) has been reported to be commercially feasible.

starch dialdehyde. Starch in which the original anhydroglucose units have been partially oxidized to dialdehyde form by oxidation, for example, the product of the oxidation of cornstarch by periodic acid.

Available in cationic dispersions up to 15% solids for mixing with paper pulp.

Uses: Thickening agent; tanning agent; binder for leaf tobacco; adhesives; wet-strength additive in paper.

starch, modified. Any of several water-soluble polymers derived from a starch (corn, potato, tapioca) by acetylation, chlorination, acid hydrolysis, or enzymatic action. These reactions yield starch acetates, esters and ethers in the form of stable and fluid solutions and films. Modified starches are used as textile sizing agents and paper coatings. Thin-boiling starches have high gel strength; oxidized starches made with sodium hypochlorite have low gelling tendency. Introduction of carboxyl, sulfonate, or sulfate groups into starch gives sodium or ammonium salts of anionic starches, yielding clear, non-gelling dispersions of high viscosity. Cationic starches result from addition of amino groups.

The glucose units of starch can be crosslinked with such agents as formaldehyde, soluble metaphosphates, and epichlorohydrin; this increases viscosity and thickening power for adhesives, canned foods, etc.

starch phosphate. An ester made from the reaction of a mixture of orthophosphate salts (sodium dihydrogen phosphate and disodium hydrogen phosphate) with starch.

Properties: Soluble in cold water (unlike regular starch), and has high thickening power. Can be frozen and thawed repeatedly without change in physical properties.

Uses: Thickener for frozen foods; taconite ore binder; in adhesives, drugs, cosmetics; substitute for arabic gum, locust bean gum, and carboxymethyl cellulose.

starch syrup. See glucose.

starch, thin-boiling. See starch, modified.

starch xanthate. A water-insoluble synthetic polysaccharide made by reacting starch with sodium hydroxide and carbon disulfide. Biodegradable. Used to encapsulate pesticides; the coating, though insoluble, is permeable to water, thus slowly releasing the pesticide. Also used as a rubber reinforcing agent.

starch xanthide. Starch xanthate which has been cross-linked with oxygen; used as strengthening agent in paper and manufacture of powdered rubbers.

"Starex."⁷⁹ Trademark for a heat-treated tall oil rosin. Uses: Rosin esters; rosin-modified synthetic resins; limed rosin; paper size.

"Starez."¹⁷⁰ Trademark for a modified polyvinyl acetate monopolymer resin emulsion. Used as a heatseal coating.

"Starfol."²²¹ Trademark for various grades of glyceryl monostearate and butyl stearate. Most grades have been approved for food additives.

"Starwax" 100.¹²⁸ Trademark for a hard petroleum microcrystalline wax; minimum m.p. 180°F.

"Sta-set."⁵⁰ Trademark for a trichlorophenoxypropionic acid product for use on apples to reduce preharvest drop.

"Sta-Sol" Lecithin Concentrate.⁴⁹² Trademark for mixtures of naturally occurring phosphatides or phospholipids, derived from soybean oil. They contain some residual oil as a solvent or carrier. Available in regular (plastic) or fluid (pourable liquid) form, bleached and unbleached. They act as emulsifiers, stabilizers, antioxidants.

Uses: Foods, especially chocolate and compound coatings, candies, bakery products, margarine; industrial uses; paints and printing inks, soaps and cosmetics, textile compounds, leather tanning, petroleum lubricants; animal feeds and pet foods.

"Statex."¹³³ Trademark for furnace carbon blacks used in rubber, printing inks and protective coatings. There are numerous grades. See furnace black.

"Stat-Eze."⁴³⁰ Trademark for a specially prepared quaternary ammonium compound, used as an externally applied antistatic agent on plastics, textiles, paper and carpeting.

"Sta-Thik" Starch.⁴⁹² Trademark for a modified corn starch of high viscosity.

Uses: Wet-end additive in paper industry; binder for both cellulose and mineral wool building materials; textile finishing; adhesives; and briquetting.

Staudinger, Hermann (1881-1965). A German chemist, winner of Nobel Prize in 1953 for his pioneer work on the structure of macromolecules and polymerization. A large part of modern high-polymer chemistry is based on his original research.

"Staybelite."²⁶⁶ Trademark for hydrogenated rosin, a pale, thermoplastic resin. Acid number 165; USDA color X; softening point 75°C; saponification number 167.

Uses: Adhesives and protective coatings.

"Stayco" Starches.⁴⁹² Trademark for a family of oxidized starches. Available in five viscosities: S, A, G, C, and M. Used by the paper industry for wet-end addition, in tub, press, and calender sizing, and as coating adhesives.

"Stayrite."¹⁰⁴ Trademark for stabilizers used to provide increased heat and light stability to vinyl resins. Available in range of products, both liquid and solid.

"Staysize" 109 Starch.⁴⁹² A white, highly uniform, chemically modified corn starch in pearl form developed for surface sizing.

"Stayzyme" Starch.⁴⁹² A thick-boiling corn starch buffered to a pH of 6.3 to 7.0 to produce the proper pH for enzyme conversion in the paper mill.

steam. An allotropic form of water (H₂O) formed at 212°F (100°C) and having a latent heat of condensation of 540 calories per gram. It has a number of industrial uses, one of the most important being the production of hydrogen by the steam-hydrocarbon gas process (reforming), by the steam-water gas process, the steam-iron process, and the steam-methanol process. It is also used in steam cracking of gas oil and naphtha, in food processing, as a cleaning agent, in rubber vulcanization, as a source of heat and power, and in distillation of plants for production of essential oils and perfumes.

Steam from geothermal sources such as hot springs and fumaroles is being utilized as an energy source. See geothermal energy, latent heat.

steam distillation. See hydrodistillation.

steam reforming. See reforming.

steapsin. A lipase in the pancreatic juice. See enzyme.

stearamide CH₃(CH₂)₁₆CONH₂. Octadecanamide. Properties: Colorless leaflets; m.p. 109°C; b.p. 251°C (12 mm); insoluble in water; slightly soluble in alcohol and ether.

Use: Corrosion inhibitor in oil wells.

stearato chromic chloride. A polynuclear complex in the form of a six-membered ring. The two chromium atoms are bridged on one side by a hydroxyl group, and on the other side by the carboxyl oxygens of the stearic acid. The water-soluble complex results from the neutralization of stearic acid with basic chromic chloride. It acts as a water repellent and adherent.

stearic acid (n-octadecanoic acid) $\text{CH}_3(\text{CH}_2)_{16}\text{COOH}$.

The most common fatty acid occurring in natural animal and vegetable fats. Most commercial stearic acid is about 45% palmitic acid, 50% stearic acid, and 5% oleic acid, but purer grades are increasingly used.

Properties: Colorless, wax-like solid. Odor and taste slight, suggesting tallow. Soluble in alcohol, ether, chloroform, carbon disulfide, carbon tetrachloride; insoluble in water. Sp. gr. 0.8390 (80/4°C); m.p. 69.6°C; b.p. 361.1°C; refractive index 1.4299 (80°C). Flash point 385°F; autoignition temp. 743°F. Combustible; nontoxic.

Derivation: (a) From high-grade tallows and yellow grease stearin by washing, hydrolysis with the Twitchell or similar reagent, boiling, distilling, cooling and pressing; (b) from oleic acid by hydrogenation.

Grades: Saponified; distilled; single-pressed; double-pressed; triple-pressed; U.S.P.; F.C.C.; 90% stearic with low oleic; grade free from chick edema factor; 99.8% pure.

Containers: Cans; barrels; bags (in slab form); tank cars and trucks.

Uses: Chemicals, especially stearates and stearate driers; lubricants; soaps; pharmaceuticals and cosmetics; accelerator activator, dispersing agent, and softener in rubber compounds; shoe and metal polishes; coatings; food packaging.

stearin (tristearin; glyceryl tristearate)

$\text{C}_3\text{H}_5(\text{C}_{18}\text{H}_{35}\text{O}_2)_3$.

Properties: Colorless crystals or powder; odorless; tasteless; m.p. 71.6°C; sp. gr. 0.943 (65°C); insoluble in water; soluble in alcohol, chloroform, carbon disulfide. Combustible; nontoxic.

Derivation: Constituent of most fats.

Grades: Technical; also grades as to source.

Uses: Soap; candles; candies; adhesive pastes; metal polishes; water-proofing paper; textile sizes; leather stuffing; mfg. of stearic acid.

stearin pitch. See fatty acid pitch.

"Stearite."¹⁰⁴ Trademark for stearic acid produced by selective hydrogenation process. Used in rubber compounding and other processing.

stearone. An aliphatic ketone; insoluble in water; stable to high temperatures, acids, and alkalis. Compatible with high-melting vegetable waxes, paraffins, and fatty acids. Incompatible with resins, polymers, and organic solvents at room temperature, but compatible with them at high temperature. Used as an antilocking agent. Combustible. Low toxicity.

N-stearoyl-para-aminophenol

$\text{HO}(\text{C}_6\text{H}_4)\text{NHCOCH}_2(\text{CH}_2)_{16}\text{CH}_3$.

Properties: White to off-white powder; m.p. 131-134°C; insoluble in water; soluble in polar organic solvents (especially when hot) such as alcohol, dioxane, acetone, and dimethylformamide. Combustible.

Use: Antioxidant.

stearoyl chloride (n-octadecanoyl chloride)

$\text{CH}_3(\text{CH}_2)_{16}\text{COCl}$.

Properties: M.p. 23°C; b.p. 174-178°C (2 mm); soluble in hydrocarbons and ethers. Combustible.

Containers: Bottles, carboys, steel drums.

Uses: Preparation of substituted amines and amides, acid anhydrides, esterification of alcohols, synthesis of other organic compounds.

stearyl alcohol (1-octadecanol; octadecyl alcohol)

$\text{CH}_3(\text{CH}_2)_{16}\text{CH}_2\text{OH}$.

Properties: Unctuous white flakes or granules with faint odor and bland taste; sp. gr. 0.8124 (59/4°C); b.p. 210.5°C (15 mm); m.p. 59°C. Soluble in alcohol, acetone, and ether; insoluble in water. Combustible; nontoxic.

Derivation: Reduction of stearic acid.

Grades: Commercial; technical; U.S.P.

Containers: 50-lb bags; 200-lb fiber drums; steam-coiled tank cars.

Uses: Perfumery; cosmetics; intermediate; surface active agents; lubricants; resins.

stearyl mercaptan (octadecyl mercaptan)

$\text{CH}_3(\text{CH}_2)_{16}\text{SH}$.

Properties: Solid; M.p. 25°C; b.p. 205-209°C (11 mm); sp. gr. 0.8420 (25/4°C); refractive index (n_D²⁰) 1.4591.

Grade: 95% (min) purity.

Hazard: Toxic; strong irritant.

Uses: Organic intermediate; synthetic rubber processing.

stearyl methacrylate. Group name for

$\text{CH}_2=\text{C}(\text{CH}_3)\text{COO}(\text{CH}_2)_n\text{CH}_3$ (n = 13 to 17).

Properties: Density 0.864 g/ml (25/15°C); boiling range 310-370°C (760 mm).

Containers: Drums.

Uses: Monomer for plastics, molding powders, solvent coatings, adhesives, oil additives; emulsions for textile, leather, paper finishing.

stearyl monoglyceridyl citrate.

Properties: A soft, practically tasteless, off-white to tan, waxy solid having a lard-like consistency. Insoluble in water but is soluble in chloroform and ethylene glycol. Low toxicity.

Derivation: Reaction of citric acid, monoglycerides of fatty acids (obtained by the glycerolysis of edible fats and oils or derived from fatty acids) and stearyl alcohol.

Grade: F.C.C.

Use: Emulsion stabilizer in foods (not over 0.15%).

stearylurea. See "Warcobase A."

steatite. A mixture of talc, clay, and alkaline-earth oxides; used chiefly as a ceramic insulator in electronic devices.

"Stedbac."⁴¹⁰ Trademark for stearyl dimethyl benzyl ammonium chloride, a hair conditioner used primarily in after-shampoo hair rinses.

steel. An alloy of iron and 0.02 to 1.5% carbon; it is made from molten pig iron by oxidizing out the excess carbon and other impurities. The open-hearth process, which uses air for this purpose has been supplanted by the basic oxygen process in which pure oxygen is injected into molten iron. A small percentage of steel is also made in the electric furnace, with iron ore as oxidant. Low-carbon (mild) steels con-

tain 0.02 to 0.3% carbon; medium-carbon grades from 0.3 to 0.7% carbon; and high-carbon grades 0.7 to 1.5%.

There are many special-purpose types of steel in which one or more alloying metals are used, with or without special heat treatment. The most common additives are chromium and nickel, as in the 18-8 stainless steels; these add greatly to corrosion resistance. High-speed and tool steels, designed primarily for efficient cutting, contain such alloying metals as tungsten, molybdenum, manganese, and vanadium, as well as chromium. Cobalt and zirconium are used for construction steels. For further information, refer to American Iron and Steel Institute, New York, N.Y.

Forms available: Rods, bars, sheet, strips, wire, wool. Uses: Construction; ship hulls; auto bodies; machinery and machine parts; cables; abrasive; chemical equipment; belts for tire reinforcement.

steel, stainless. Alloy steels containing high percentages of chromium, from less than 10 to more than 25%. There are three groups: (1) Austenitic, which contain both chromium (16% min.) and nickel (7% min.); a stress-corrosion resistant type contains 2% silicon. (2) Ferritic, which contain chromium only and cannot be hardened by heat treatment. (3) Martensitic, which contain chromium and can be hardened by heat treatment; these are ferromagnetic. A subgroup of the martensitic steels comprises the precipitation-hardening types. See also SAE steel.

Steffen process. A process used in beet sugar manufacture to separate residual sugar from molasses. Based on the formation of insoluble tricalcium saccharate and its subsequent decomposition to sugar in the presence of a weak acid such as carbonic.

Steinbuhl yellow. See barium chromate.

"Stellite."²¹⁴ Trademark for a series of cobalt-chromium-tungsten alloys. There are nine alloys available in the wear-resistant group.

Uses: Special castings, hard-facing rods, and metal-cutting tools. High-temperature grades are also produced by the investment casting process for jet engine turbine blades and vanes.

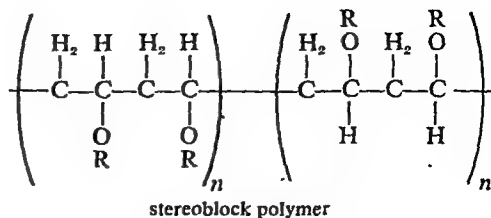

stendomycin salicylate. A fungicide.

Stengel process. A method of making ammonium nitrate fertilizer from anhydrous ammonia and nitric acid. The fertilizer particles can be made in different sizes according to the use.

"Stepan."⁴⁵¹ Trademark for a series of detergent and detergent intermediates, including lauryl sulfates, alkylolamides, fatty alcohol ether sulfates, linear alkylate sulfonates and ethoxylated nonionics.

"Sterane."²⁹⁹ Trademark for prednisolone.

stereoblock polymer. A polymer whose molecule is made of comparatively long sections of identical stereospecific structure, these sections being separated from one another by segments of different structure, as for example, blocks of an isotactic polymer interspersed with blocks of the same polymer with a syndiotactic structure. See polymer, stereospecific; block polymer.

stereochemistry. A subdiscipline of organic chemistry devoted to study of the three-dimensional spatial configurations of molecules. One aspect of the subject deals with stereoisomers—compounds which have identical chemical constitution, but differ as regards the arrangement of the atoms or groups in space. Stereoisomers fall into two broad classes: optical isomers and geometric (cis-trans) isomers. Another aspect of stereochemistry concerns control of the molecular configuration of high polymer substances by use of appropriate (stereospecific) catalysts. See also optical isomer; enantiomer; asymmetry; polymer, stereospecific; Ziegler catalyst; geometric isomer.

stereoisomer. See stereochemistry.

stereoregular polymer. See polymer, stereospecific.

stereospecific catalyst. See catalyst, stereospecific.

stereospecific polymer. See polymer, stereospecific.

steric hindrance. A characteristic of molecular structure in which the molecules have a spatial arrangement of their atoms such that a given reaction with another molecule is prevented or retarded.

sterilization. (1) Complete destruction of all bacteria and other infectious organisms in an industrial, food, or medical product; it must be followed by aseptic packaging to prevent recontamination, usually by hermetic sealing. The methods used involve either wet or dry heat, use of chemicals such as formaldehyde and ethylene oxide filtration (pharmaceutical products), and irradiation by ultraviolet or gamma radiation. Milk is sterilized by heating for 30 seconds at 135°C, followed by in-can heating at 115°C for several minutes and aseptic packaging.

(2) Rendering an insect incapable of reproduction by radiation or chemical treatment. See chemosterilant.

"Sterimine."²⁸² Trademark for trichloromelamine compounded with salt, wetting agent, and acid phosphate buffer. Available chlorine: 50%.

Properties: White, free-flowing powder; slight chlorine odor.

Containers: 10-, 25-, 100-lb fiber drums.

Uses: Sanitizer of ion exchange beds, and of surfaces of equipment and utensils.

sterling silver. According to U.S. law this term is restricted to silver alloys containing at least 92.5% pure silver and 7.5% max. other metal (usually copper). See also silver.

steroid. One of a group of polycyclic compounds closely related biochemically to terpenes. They include cholesterol, numerous hormones, precursors of certain vitamins, bile acids, alcohols (sterols), and certain natural drugs and poisons (such as the digitalis derivatives). Steroids have as a common nucleus a fused reduced 17-carbon-atom ring system, cyclopentanoperhydrophenanthrene. Most steroids also have

two methyl groups and an aliphatic side-chain attached to the nucleus. The length of the side-chain varies and generally contains 8, 9 or 10 carbon atoms in the sterols, 5 carbon atoms in the bile acids, 2 in the adrenal cortical steroids, and none in the estrogens and androgens. Steroids are classed as lipids because of their solubility in organic solvents and insolubility in water.

Most of the naturally occurring steroids have been synthesized and many new steroids unknown in nature have been synthesized for use in medicine, such as the fluorosteroids (dexamethasone).

sterol. A steroid alcohol. Such alcohols contain the common steroid nucleus, plus an 8 to 10-carbon-atom side-chain and a hydroxyl group. Sterols are widely distributed in plants and animals, both in the free form and esterified to fatty acids. Cholesterol (q.v.) is the most important animal sterol; ergosterol is an important plant sterol (phytosterol).

"Sterosan."²¹⁹ Trademark for a brand of chlorquinaldol (q.v.).

"Sterox."²¹⁸ Trademark for a series of nonionic surface-active agents including polyoxyethylene ethers, and polyoxyethylene thioethers.

STH. See somatotrophic hormone.

stibic anhydride. See antimony pentoxide.

stibine. See antimony hydride.

stibium. The Latin name for the element antimony; hence the symbol Sb.

stibnite (gray antimony; antimony glance; antimonite) Sb_2S_3 .

Properties: Lead gray mineral; subject to blackish tarnish; metallic luster. Soluble in concentrated boiling hydrochloric acid with evolution of H_2S . Sp. gr. 4.52–4.62; Mohs hardness 2.

Occurrence: Japan; China; Mexico; Bolivia, Peru, South Africa.

Use: The most important ore of antimony.

stibophen $\text{C}_{12}\text{H}_4\text{Na}_4\text{O}_{16}\text{S}_4\text{Sb} \cdot 7\text{H}_2\text{O}$. Sodium antimony II bis(catechol-2,4-disulfonate) heptahydrate.

Properties: White, crystalline, odorless powder. Affected by light. Freely soluble in water; nearly insoluble in alcohol, ether, and chloroform.

Derivation: Reaction of sodium pyrocatechol-3,5-disulfonate with antimony trioxide and precipitating with alcohol.

Grade: U.S.P.

Use: Medicine.

stigmasterol $\text{C}_{29}\text{H}_{48}\text{O} \cdot \text{H}_2\text{O}$. A plant sterol.

Properties: Anhydrous form has m.p. of 170°C . Insoluble in water; soluble in usual organic solvents. Combustible.

Derivation: From soy or calabar beans.

Uses: Preparation of progesterone and other important steroids.

stilbene (toluylene; trans form of alpha, beta-diphenylethylene) $\text{C}_6\text{H}_5\text{CH}=\text{CHC}_6\text{H}_5$.

Properties: Colorless or slightly yellow crystals; sp. gr. 0.9707; m.p. $124\text{--}125^\circ\text{C}$; b.p. $306\text{--}307^\circ\text{C}$. Soluble in benzene and ether; slightly soluble in alcohol; insoluble in water. Combustible.

Derivation: By passing toluene over hot lead oxide.

Method of purification: Crystallization; zone melting used for very pure crystals.

Grades: Technical; pure.

Uses: Manufacture of dyes and optical bleaches; crystals are used as phosphors and scintillators.

Note: The cis form of alpha, beta-diphenylethylene (isostilbene), is a yellow oil; b.p. 145°C (13 mm); m.p. 1°C .

stilbene dye. A dye whose molecules contain both the $-\text{N}=\text{N}-$ and the $>\text{C}=\text{C}<$ chromophore groups in their structure and whose CI numbers range from 40000 to 40999. These are direct cotton dyes.

stilbestrol. See diethylstilbestrol.

stillage. The grain residue from alcohol production, used in feeds and feed supplements.

Stock system. See chemical nomenclature.

Stoddard solvent. A widely used dry-cleaning solvent.

U.S. Bureau of Standards and ASTM D—484—52 define it as a petroleum distillate clear and free from suspended matter and undissolved water, and free from rancid and objectionable odor. The minimum flash point is 100°F . Distillation range: not less than 50% over at 350°F (177°C), 90% over at 375°F (190°C), and the end point not higher than 410°F (210°C). Autoignition temp. 450°F . Combustible.

Containers: 55-gal steel drums; tank cars; tank trucks. Hazard: Moderate fire risk. Moderately toxic by ingestion. Tolerance, 200 ppm in air.

"Stod-Sol."²⁰⁰ Trademark for a petroleum solvent prepared by straight-run distillation.

Properties: Water-white; initial boiling point $308\text{--}316^\circ\text{F}$, 95% distills between $363\text{--}373^\circ\text{F}$; sp. gr. 0.780 (60°F); flash point (TCC) 103°F ; mild, nonresidual odor. Combustible.

Hazard: Moderate fire risk.

Use: Dry cleaning.

stoichiometry. The branch of chemistry and chemical engineering that deals with the quantities of substances that enter into and are produced by chemical reactions. For example, when methane unites with oxygen in complete combustion, 16 grams of methane require 64 grams of oxygen. At the same time 44 grams of carbon dioxide and 36 grams of water are formed as reaction products. Every chemical reaction has its characteristic proportions. The methods of obtaining these from chemical formulas, equations, atomic weights and molecular weights, and determination of what and how much is used and produced in chemical processes is the major concern of stoichiometry.

Stokes' law. (1) The rate at which a spherical particle will rise or fall when suspended in a liquid medium varies as the square of its radius; the density of the particle and the density and viscosity of the liquid are essential factors. Stokes' law is used in determining sedimentation of solids, creaming rate of fat particles in milk, etc. The equation is:

$$v = \frac{h}{t} = \frac{gD^2(\rho_s - \rho_l)}{18\eta}$$

where v is the terminal velocity, h the height of fall, t the time, g the gravitational constant, D , the particle diameter, ρ_s , ρ are the densities of the solid and the suspending medium, respectively, and η is the viscosity.

(2) In atomic processes, the wavelength of fluorescent radiation is always longer than that of the exciting radiation.

storage. Methods of keeping raw materials, finished goods, or food products while awaiting use, shipment, or consumption. Normally materials are stored in suitably protected interior areas, though in some cases outdoor storage is practicable, e.g., logs for wood pulp, materials received in metal drums, and certain bulk solids.

Raw materials. These should be stored in well-ventilated rooms at temperatures ranging from about 35 to 100°F. Materials which may react to form hazardous products in case of spillage should be kept well separated; oxidizing agents (nitrates, peroxides, etc.) should not be stored near reducing or combustible materials. Heat-sensitive materials should be kept away from hot pipes or other heat source, especially in the case of flammable liquids. Textiles, paper and other hygroscopic materials require a humidity-controlled environment.

Finished goods. Combustible products that may build up internal heat on long standing at high temperatures should be stored in well-ventilated or air-conditioned areas, e.g., paper (as in telephone books), bulk wool and cellulotics.

Food Products. Long shelf-life at or near room temperature is highly desirable for processed foods. This is achieved partly by use of antioxidants and other preservatives, and partly by processing techniques. Much experimental work has been done in this field. Refrigerated storage at temperatures near 40°F is used for meats, eggs and other dairy products. Meats and quick-frozen foods can be stored indefinitely at or below 0°F. Controlled-atmosphere storage to retard post-harvest ripening has long been used for unprocessed fruits and vegetables (see atmosphere, controlled).

storage battery. A secondary battery, so called because the conversion of chemical to electrical energy is reversible, and the battery is thus rechargeable. An automobile battery usually consists of from 12 to 17 cells with plates (electrodes) made of sponge lead (negative plate or anode) and lead dioxide (positive plate or cathode), which is in the form of a paste. The electrolyte is sulfuric acid. The chemical reaction that yields electric current is $\text{Pb} + \text{PbO}_2 + 2\text{H}_2\text{SO}_4 \rightleftharpoons 2\text{PbSO}_4 + 2\text{H}_2\text{O} + 2e$. More complicated and expensive types have nickel-iron, nickel-cadmium, silver-zinc and silver-cadmium as electrode materials. A sodium-liquid sulfur battery for high-temperature operation as well as a chlorine-zinc type using titanium electrodes have also been developed. See also battery.

storax. U.S.P. name for styrax (q.v.).

"Stoxil."⁷¹ Trademark for a brand of idoxuridine (q.v.).

STP. Abbreviation for standard temperature and pressure, i.e., 0°C and 1 atmosphere pressure.

STPP. Abbreviation for sodium tripolyphosphate.

straight-chain. See aliphatic.

straight-run. See gasoline.

stramonium (jimson weed; thorn apple; stinkweed).

Derivation: Dried leaves and flowering tops of *Datura stramonium* or its variety *tutula*.

Constituents: Atropine, scopolamine, proteins, albumin.

Occurrence: Europe; Asia; America.

Hazard: Toxic; skin irritant.

Uses: Medicine (antispasmodic); source of alkaloids.

strangeness. See antiparticle.

"Stratabond."⁵²⁶ Trademark for organic phosphate coatings used for the preparation of steel, galvanized steel, and aluminum for painting. Application by spray, dip, flow-coat or roller coat.

streaming potential. A potential resulting from the friction of a liquid passing through a tube or pipe; its strength depends on the viscosity of the liquid, diameter of the pipe, and rate of flow. This can be a factor in pipelines conveying oil and chemicals.

"Stren."²⁸ Trademark for a high-strength, and low-elongation nylon monofilament for fishing lines.

streptolin.

Properties: An antibiotic, isolated as the hydrochloride.

Gummy mass; soluble in water; most stable at pH 3.0-3.5.

Derivation: Produced by *Streptomyces* no. 11.

Hazard: May be toxic.

Uses: Antibiotic; possible rodenticide.

streptomycin $\text{C}_{21}\text{H}_{39}\text{N}_7\text{O}_{12}$. A specific antibiotic, but the term is also used loosely to designate several chemically related antibiotics produced by actinomycetes. Streptomycin is produced by *Streptomyces griseus* and consists of streptidine attached in glycosidic linkage to the disaccharide, streptobiosamine. It is active against gram-negative bacteria and the tubercle bacillus.

Properties: A base which readily forms salts with anions. Quite stable but very hygroscopic.

Units: One unit equals one microgram of pure crystalline streptomycin base.

Derivation: From *streptomyces griseus* by submerged culture. The streptomycin is then concentrated by adsorption on activated carbon and purified.

Hazard: Possible damage to nerves and kidneys may result. Use restricted by FDA.

Use: Medicine (usually as sulfate).

See also dihydrostreptomycin.

streptonigrin (USAN) $\text{C}_{25}\text{H}_{22}\text{N}_4\text{O}_8$. An antibiotic derived from *Streptomyces flocculus*. Dark brown rectangular crystals.

"Stripkolex."²⁸ Trademark for a dynamite for coal-stripping operations.

"Stripolite."¹⁵⁹ Trademark for a modified sodium sulfoxylate formaldehyde. Used as a powerful reducing agent to strip dyed colors from wool and synthetics.

stripping.

(1) Removal of relatively volatile components from a gasoline or other liquid mixture by distillation, evaporation, or by passage of steam, air or other gas through the liquid mixture.

(2) Rapid removal of color from an improperly dyed fabric or fiber by a chemical reaction. Compounds used for this purpose in vat dyeing or in discharge printing are termed discharging agents. Substances commonly used as strippers are sodium hydrosulfite, titanous sulfate, sodium and zinc formaldehyde sulfoxylates.

strontia. See strontium oxide.

strontianite SrCO_3 . Natural strontium carbonate.

Properties: Color white, gray, yellow, green; luster vitreous; Mohs hardness 3.5-4; sp. gr. 3.7.

Occurrence: California, New York, Washington; Germany; Mexico.

Use: Source of strontium chemicals.

strontium Sr Metallic element, of atomic number 38, Group IIA of Periodic Table. Atomic weight 87.62. Valence 2. Radioactive isotopes Sr-89 and Sr-90. There are 4 stable isotopes.

Properties: Pale yellow, soft metal, chemically similar to calcium. Soluble in alcohol and acids; decomposes water on contact. Occurs in nature in the minerals strontianite (carbonate) and celestite (sulfate). Sp. gr. 2.54; m.p. 752°C; b.p. 1390°C. Low toxicity.

Derivation: (a) Electrolysis of molten strontium chloride in a graphite crucible with cooling of the upper, cathodic space; (b) thermal reduction of the oxide with metallic aluminum (strontium aluminum alloy formed), and distilling the strontium in a vacuum.

Grade: Technical.

Containers: Glass bottles containing sufficient naphtha to cover the metal.

Hazard: Spontaneously flammable in powder form; ignites when heated above melting point. Reacts with water to evolve hydrogen. Store under naphtha.

Uses: Alloys; "getter" in electron tubes.

Shipping regulations: (Air) (alloys) Flammable Solid label; (metal in organic solvent), (Air) Not acceptable on passenger planes.

strontium 90. Radioactive strontium isotope.

Properties: Half-life, 38 years; radiation, beta.

Derivation: From the fission products of nuclear reactor fuels.

Forms available: A mixture containing strontium 90, yttrium 90, and strontium 89 chlorides in hydrochloric acid solution; also as the carbonate and titanate.

Hazard: Highly toxic radioactive poison; present in fallout from nuclear explosions. Absorbed by growing plants; when ingested attacks bone marrow with possibly fatal results. It may be partially removed from milk by treatment with vermiculite (q.v.).

Uses: Radiation source in industrial thickness gauges; elimination of static charge; treatment of eye diseases; in radio-autography to determine the uniformity of material distribution; in electronics for studying strontium oxide in vacuum tubes; activation of phosphors; source of ionizing radiation in luminous paint; cigarette density control; measuring silt density; atomic batteries, etc.

Shipping regulations: (Rail, Air) Consult regulations.

strontium acetate $\text{Sr}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \frac{1}{2} \text{H}_2\text{O}$.

Properties: White, crystalline powder; soluble in water. Loses $\frac{1}{2} \text{H}_2\text{O}$ at 150°C.

Derivation: Interaction of strontium hydroxide and acetic acid, followed by crystallization.

Grades: Technical; reagent.

Use: Medicine; intermediate for strontium compounds; catalyst production.

strontium arsenite $\text{Sr}(\text{AsO}_2)_2 \cdot 4\text{H}_2\text{O}$ (approx.).

Properties: White powder; slightly soluble in water and alcohol. Odorless; soluble in dilute acids.

Hazard: Highly toxic.

Use: Medicine.

Shipping regulations: (Rail, Air) Poison label.

strontium bromate $\text{Sr}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless or yellowish, crystalline, lustrous powder. Hygroscopic. Soluble in water. Sp. gr. 3.773; loses H_2O at 120°C; decomposes 240°C.

Hazard: Moderately toxic. Strong oxidant; fire risk in contact with organic materials.

strontium bromide $\text{SrBr}_2 \cdot 6\text{H}_2\text{O}$.

Properties: White, hygroscopic crystals or powder. Soluble in water, alcohol, and amyl alcohol. Insoluble in ether. Sp. gr. 2.386 (25/4°C); loses $4\text{H}_2\text{O}$ at 89°C, remaining H_2O by 180°C; m.p. anhydrous salt 643°C.

Derivation: Strontium carbonate is treated with bromine or hydrobromic acid.

Grades: Anhydrous powder; crystal; technical; C.P.

Containers: Bottles; 150-lb drums.

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Medicine; laboratory reagent.

strontium carbonate SrCO_3 .

Properties: White, impalpable powder. Soluble in acids, carbonated water and solutions of ammonium salts; slightly soluble in water. Sp. gr. 3.62; loses CO_2 at 1340°C. Low toxicity.

Derivation: Celestite is boiled with a solution of ammonium carbonate or is fused with sodium carbonate.

Grades: Precipitated; technical; natural; reagent.

Containers: 50-lb bags; drums.

Uses: Catalyst; in radiation-resistant glass for color television tubes; ceramic ferrites; pyrotechnics.

strontium chlorate (a) $\text{Sr}(\text{ClO}_3)_2$; (b) $\text{Sr}(\text{ClO}_3)_2 \cdot 8\text{H}_2\text{O}$.

Properties: White, crystalline powder. Soluble in water; slightly soluble in alcohol. (a) Sp. gr. 3.152; m.p., decomposes at 120°C.

Derivation: Strontium hydroxide solution is warmed and chlorine passed in, with subsequent crystallization.

Grades: Technical; reagent.

Containers: Tins; glass bottles.

Hazard: Dangerous explosion risk in contact with organic materials; highly sensitive to shock, heat and friction. Moderately toxic by ingestion.

Use: Manufacture of red-fire and other pyrotechnics; tracer bullets.

Shipping regulations: (wet and dry) (Rail) Yellow label. (Air) Oxidizer label.

strontium chloride (a) SrCl_2 ; (b) $\text{SrCl}_2 \cdot 6\text{H}_2\text{O}$.

Properties: White, crystalline needles; odorless; sharp, bitter taste; soluble in water and alcohol. (a) Sp. gr. 3.054; m.p. 872°C; b.p. 1250°C. (b) Sp. gr. 1.964; m.p. loses $6\text{H}_2\text{O}$ at 112°C.

Derivation: Strontium carbonate is fused with calcium chloride, the melt extracted with water, the solution concentrated and crystallized.

Grades: Reagent; technical; anhydrous.

Containers: Bottles; wooden kegs; fiber drums; carloads.

Uses: Strontium salts; pyrotechnics; medicine; electron tubes.

strontium chromate SrCrO_4 .

Properties: Light yellow pigment; sp. gr. 3.84; rust-inhibiting and corrosion-resistant properties. Has good heat and light resistance and low reactivity in high acid vehicles.

Containers: Fiber drums.

Uses: Metal protective coatings to prevent corrosion; polyvinyl chloride resins to produce pastel primrose yellows; pyrotechnics.

strontium dioxide. See strontium peroxide.

strontium fluoride SrF_2 .

Properties: White powder; soluble in hydrochloric acid and hydrofluoric acid. Insoluble in water. Sp. gr. 4.2; m.p. 1463°C; b.p. 2489°C.

Grades: Crystal, 99.2% pure.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Medicine; substitute for other fluorides; electronic and optical applications; single crystals for lasers; high-temperature dry film lubricants.

strontium hydrate. See strontium hydroxide.

strontium hydroxide (strontium hydrate) (a) $\text{Sr}(\text{OH})_2$;

(b) $\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$.

Properties: Colorless, deliquescent crystals. Soluble in acids and hot water; slightly soluble in cold water. Absorbs carbon dioxide from air. Sp. gr. (a) 3.625; m.p. 375°C; decomposes 710°C. (b) Sp. gr. 1.90. Low toxicity.

Derivation: Heating the carbonate or sulfide in steam.

Grades: Technical; C.P.; reagent.

Containers: Bottles; drums.

Uses: Extraction of sugar from beet sugar molasses; lubricant soaps and greases; stabilizer for plastics; glass; adhesives.

strontium hyposulfite. See strontium thiosulfate.

strontium iodide (a) $\text{SrI}_2 \cdot 6\text{H}_2\text{O}$.

Properties: (a) White, crystalline plates; decomposes in moist air. Becomes yellow on exposure to air or light. (b) White crystals; soluble in water and alcohol. (a) Sp. gr. 4.549; m.p. 515°C; b.p. decomposes. (b) Sp. gr. 2.67 (25°C); decomposes 90°C.

Derivation: By treating strontium carbonate with hydriodic acid.

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Medicine; intermediate.

strontium lactate $\text{Sr}(\text{C}_3\text{H}_5\text{O}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White crystals or granular powder. Soluble in water, alcohol, ether. Odorless.

Use: Medicine.

strontium molybdate SrMoO_4 .

Properties: Crystalline powder; density 4 g/cc; m.p. 1600°C (approx); insoluble in water. Low toxicity.

Grades: 99.99% pure; single crystals.

Uses: Anticorrosion pigments; electronic and optical applications; single-crystal, solid-state lasers.

strontium monosulfide. See strontium sulfide.

strontium nitrate $\text{Sr}(\text{NO}_3)_2$.

Properties: White powder. Soluble in water; slightly soluble in absolute alcohol. Sp. gr. 2.98; m.p. 570°C; b.p. 645°C.

Derivation: A concentrated solution of strontium chloride is treated with a solution of sodium nitrate.

Grades: Technical; reagent.

Containers: Bags; barrels; drums.

Hazard: Moderately toxic. Strong oxidizing agent.

Fire risk in contact with organic materials. May explode when shocked or heated.

Uses: Pyrotechnics; marine signals, railroad flares; matches; medicine; intermediate; electron tubes.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

strontium nitrite $\text{Sr}(\text{NO}_2)_2$.

Properties: White or yellowish powder, or hygroscopic needles. Soluble in water; insoluble in alcohol. Sp. gr. 2.8. Decomp. at 240°C.

strontium oxalate $\text{SrC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: White, odorless powder; loses H_2O at 150°C; insoluble in cold water.

Hazard: May be toxic.

Uses: Pyrotechnics; catalyst manufacture; tanning.

strontium oxide (strontia) SrO

Properties: Grayish white powder; sp. gr. 4.7; m.p. 2430°C; b.p. approx 3000°C. Soluble in fused potassium hydroxide; converted to hydroxide by water. Combustible.

Derivation: Decomposition of strontium carbonate or hydroxide.

Grades: Lump; powder; porous carbide-free; reagent.

Containers: Sealed cans; drums.

Uses: Manufacture of strontium salts; pyrotechnics; pigments; medicine; greases and soaps; a major desiccant.

strontium perchlorate $\text{Sr}(\text{ClO}_4)_2$.

Properties: Colorless crystals; very soluble in water and alcohol.

Hazard: Moderately toxic. Fire and explosion risk in contact with organic materials.

Uses: Oxidizing agent; pyrotechnics.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

strontium peroxide (strontium dioxide) (a) SrO_2 (b) $\text{SrO}_2 \cdot 8\text{H}_2\text{O}$.

Properties: White powder; odorless and tasteless; sp. gr. (a) 4.56; m.p., decomposes at 215°C; (b) sp. gr. 1.951; loses $8\text{H}_2\text{O}$ at 100°C and decomposes when heated to a higher temperature. Soluble in ammonium chloride solution and alcohol; decomposes in hot water. Slightly soluble in cold water.

Derivation: (a) By passing oxygen over heated strontium oxide. (b) Reaction of strontium hydroxide and hydrogen peroxide.

Hazard: Dangerous fire and explosion risk in contact with organic materials; sensitive to heat, shock, catalysts, reducing agents.

Uses: Bleaching; medicine; fireworks.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

strontium-potassium chlorate (potassium-strontium chlorate) $\text{Sr}(\text{ClO}_3)_2 \cdot 2\text{KClO}_3$.

Properties: White, crystalline powder. Soluble in water. Grade: Technical.

Hazard: Dangerous fire and explosion risk in contact with organic materials; sensitive to heat, shock, catalysts, reducing agents.

Use: Pyrotechnics.

Shipping regulations: (Rail, Air) Chlorates n.o.s. Oxidizer label.

strontium salicylate $\text{Sr}(\text{C}_7\text{H}_5\text{O}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals or powder; odorless with sweet saline taste. Soluble in water and alcohol; decomposes when heated. Protect from light.

Derivation: Interaction of strontium carbonate and salicylic acid.

Uses: Medicine; pharmaceutical and fine chemical manufacture.

strontium stearate $\text{Sr}(\text{OOC}_{17}\text{H}_{35})_2$.

Properties: White powder; m.p. 130–140°C. Insoluble in alcohol; soluble (forms gel) in aliphatic and aromatic hydrocarbons.

Use: Grease and wax compounding.

strontium sulfate SrSO_4 .

Properties: White precipitate or crystals of the mineral celestite. Odorless. Slightly soluble in concentrated acids; very slightly soluble in water; insoluble in alcohol and dilute sulfuric acid. Sp. gr. 3.71–3.97; m.p. 1605°C.

Derivation: (a) Celestite is ground. (b) Precipitation of any soluble strontium salt with sodium sulfate.

Grades: Natural; precipitated; air-floated, 90%, 325 mesh; free from sodium salts; C.P.

Uses: Pyrotechnics; ceramics and glass; paper manufacture.

strontium sulfide (strontium monosulfide) SrS .

Properties: Gray powder. Has hydrogen sulfide odor when in presence of moist air. Soluble in acids (decomposes); slightly soluble in water. Sp. gr. 3.7; m.p. above 2000°C .

Derivation: Reduction of celestite with coke at high temperatures.

Grades: Technical; high purity.

Containers: Glass bottles; sealed drums.

Hazard: Irritant to skin and tissue. Moderate fire and explosion risk.

Uses: Depilatory; luminous paints; source of hydrogen sulfide; manufacture of strontium chemicals.

strontium tartrate $\text{SrC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$.

Properties: White crystals; sp. gr. 1.966; slightly soluble in water. Combustible. Low toxicity.

Use: Pyrotechnics.

strontium thiosulfate (strontium hyposulfite)

$\text{SrS}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$.

Properties: Fine needles. Soluble in water; insoluble in alcohol; sp. gr. 2.17; m.p. loses $4\text{H}_2\text{O}$ at 100°C .

strontium titanate SrTiO_3 .

Properties: Powder, sp. gr. 4.81; m.p. ca 2060°C . Insoluble in water and most solvents. Low toxicity.

Grades: Technical; single crystals.

Use: Electronics; electrical insulation.

strontium zirconate SrZrO_3 .

Properties: Powder; m.p. ca 2600°C . Low toxicity.

Use: Electronics.

"Structo-Foam."¹ Trademark for expanded polystyrene foam products used for insulation in buildings, refrigerator cars and trucks and for bouyancy in floats, moorings, etc.

structural antagonist. See antagonist, structural.

structural formula. See formula, chemical.

"Struex-80."⁴⁷¹ Trademark for a fine particle size grade of hydrated aluminum silicate produced from kaolin. Used in paint systems.

"Struflow."⁴⁷¹ Trademark for large, thin, platy particles of hydrated aluminum silicates produced from kaolin. Particle size: 10 to 20 microns in diameter, 1.0 micron thick. Used in paint systems.

strychnidine $\text{C}_{21}\text{H}_{24}\text{ON}_2$.

Properties: Colorless crystals; m.p. 256°C .

Use: Reagent for nitrate determination.

strychnine $\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2$. An alkaloid.

Properties: Hard, white, crystals or powder; bitter taste. M.p. $268\text{--}290^{\circ}\text{C}$; b.p. 270°C (5 mm). Soluble in chloroform; slightly soluble in alcohol and benzene; slightly soluble in water and ether.

Derivation: Extraction of the seeds of *Nux vomica* with acetic acid, filtration, precipitation by alkali and filtration.

Grades: Crystal; powder; technical.

Hazard: Highly toxic by ingestion and inhalation; tolerance, 0.15 mg per cubic meter of air.

Uses: In medicine as such, or as phosphates; rodent poison.

Shipping regulations: (Rail, Air) Poison label.

"Strycin."⁴¹² Trademark for streptomycin syrup.

stuff. Term used by paper makers to refer to the aqueous pulp suspension fed onto the fourdrinier wire from the headbox. See also furnish.

"Sty-Grade."⁵⁷⁶ Trade mark for an additive to polystyrene which imparts biodegradability, primarily for such disposable products as plastic bottles.

"Stymer" Vinyl Styrene.⁵⁸ Trademark for resins used as sizes for filament acetates.

LF. A vinyl resin, soluble with ammonium hydroxide.

S. Styrene copolymer resin, soluble in water.

S-type synthetic elastomer. See styrene-butadiene rubber.

"Styphen."²³³ Trademark for a mixture of styrenated phenols.

Use: Antioxidant.

styphnic acid (2,4,6-trinitroresorcinol)

$\text{C}_6\text{H}(\text{OH})_2(\text{NO}_2)_3$.

Properties: Yellow crystals; astringent taste; an initiating explosive; m.p. $179\text{--}180^{\circ}\text{C}$; forms additive compounds with many hydrocarbons. Soluble in ethyl alcohol and ether; slightly soluble in water.

Derivation: Nitration of resorcinol.

Hazard: Severe explosion risk when heated. Probably toxic.

Use: Priming agents in the explosives industry.

Shipping regulations: (Rail) Consult authorities. (Air) (dry or wet with less than 10% water) Not acceptable; (wet with not less than 10% water) Flammable Solid label.

Legal label name: trinitroresorcinol.

styracin. See cinnamyl cinnamate.

"Styrafil."⁵³⁹ Trademark for polystyrene with glass fiber reinforcement.

styrallyl acetate. See alpha-methylbenzyl acetate.

styrallyl alcohol. See alpha-methylbenzyl alcohol.

styrax. A type of balsam found in Central America and the Near East. See balsam.

styrenated oil. A drying oil whose drying and hardening characteristics have been modified by incorporation of styrene or a similar monomer.

styrene. See polystyrene; styrene monomer.

styrene monomer (vinylbenzene; phenylethylene; cinnamene) $\text{C}_6\text{H}_5\text{CH}:\text{CH}_2$.

Properties: Colorless, oily liquid; aromatic odor. F.p. -30.63°C ; b.p. 145.2°C ; sp. gr. (25/25 $^{\circ}\text{C}$) 0.9045; wt/gal (20 $^{\circ}\text{C}$) 7.55 lbs; flash point 88°F . Autoignition temp 914°F . Insoluble in water; soluble in alcohol and ether. Readily undergoes polymerization when heated or exposed to light or a peroxide catalyst. The polymerization releases heat and may become explosive.

Derivation: From ethylene and benzene in the presence of aluminum chloride to yield ethylbenzene, which is catalytically dehydrogenated at about 630°C to form styrene.

Grades: Technical 99.2%; polymer 99.6%.

Containers: Glass bottles; carboys; steel drums; tank cars and tank trucks.

Hazard: Moderately toxic by ingestion and inhalation. Tolerance, 100 ppm in air. Flammable, moderate fire risk. Explosive limits in air 1.1 to 6.1%. Must be

inhibited during storage. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Polystyrene plastics; SBR, ABS and SAN resins; protective coatings (Styrene-butadiene latex; alkyds); styrenated polyesters; rubber-modified polystyrene; copolymer resins; intermediate

Shipping regulations: (Rail) Not listed. (Air) (inhibited) No label required; (uninhibited) Not acceptable.

styrene-acrylonitrile. See polystyrene.

styrene-butadiene rubber (SBR). By far the most widely used type of synthetic rubber; its consumption for all applications is about four times that of polybutadiene, its nearest competitor, and $1\frac{1}{2}$ times that of all other elastomers combined. Its manufacture involves copolymerization of about 3 parts butadiene with 1 part styrene. These materials are suspended in finely divided emulsion form in a large proportion of water, in the presence of a soap or detergent. Also present in small amounts are an initiator or catalyst which is usually a peroxide, and a chain-modifying agent such as dodecyl mercaptan.

Uses: Tires, footwear, mechanical goods; coatings; adhesives; solvent-release sealants; carpet backing. See also rubber, synthetic; polymerization; free radical.

styrene nitrosite. A compound resulting from the reaction between styrene and nitrogen dioxide and used as a qualitative or quantitative specific test for monomeric styrene in mixtures with other hydrocarbons.

styrene oxide $C_6H_5CHOCH_2$.

Properties: Colorless to pale straw-colored liquid. Boiling range (5 to 95%) 194.2–195°C; f.p. –36.6°C; flash point 180°F (COC); refractive index (n 25/D) 1.5328; sp. gr. (25/4°C) 1.0469; miscible with benzene, acetone, ether, and methanol. Combustible.

Hazard: Moderately toxic and irritant.

Uses: Highly reactive organic intermediate.

"Styresol."³⁶ Trademark for a group of styrenated alkyd resins with air-drying and baking properties and high resistance to gasoline, alkalies, acids, and water.

"Styrocrete."²³³ Trademark for latex formulation used as an additive for cement mortar to bond plastic foam to various surfaces.

"Styretex."⁴⁷⁴ Trademark for styrenated alkyd resins.

"Styrofoam."²³³ Trademark for expanded, cellular polystyrene (available in colors).

Used: Insulating material; light-weight materials for boats, toys, etc.; separators in packing containers; airport runways; highway construction; battery cases.

"Styron."²³³ Trademark for polystyrene resins; general purpose, medium and hi impact, heat and impact-resistant, and light-stabilized resins ("Styron Verelite"). Available in wide range of translucent and opaque colors, as well as natural and crystal.

Uses: Packaging, toys, appliance parts, bottle closures and containers, hot and cold drinking cups, television cabinet backs, automotive components and machine housings, lighting equipment.

styryl carbinol. See cinnamic alcohol.

suberane. See cycloheptane.

suberic acid (octanedioic acid) $HOOC(CH_2)_6COOH$.

Properties: Colorless crystals from water; m.p. 143°C; b.p. 279°C at 100 mm. Sparingly soluble in ether; soluble in alcohol and hot water; slightly soluble in cold water. Combustible.

Derivation: Oxidation of cyclooctene or cyclooctane. Uses: Intermediate for the synthesis of drugs, dyes and high polymers.

suberone. See cycloheptanone.

sublimation. The direct passage of a substance from solid to vapor without appearing in the intermediate (liquid) state. An example is solid carbon dioxide which vaporizes at room temperature; the conversion may also be from vapor to solid under appropriate conditions of temperature.

subnuclear particle. A particle either found in the nucleus or observed coming from the nucleus as the result of nuclear reaction or rearrangement, i.e., neutrons, mesons, etc.

substance. Any chemical element or compound. All substances are characterized by a unique and identical constitution, and are thus homogeneous (q.v.). "A material of which every part is like every other part is said to be homogeneous and is called a substance." (Black and Conant, "Practical Chemistry.")

See also homogeneous.

substantive dye. See direct dye.

substituent. An atom or radical that replaces another in a molecule as the result of a reaction. See substitution.

substitution. The replacement of one element or radical by another as a result of a chemical reaction. Chlorination of benzene to produce chlorobenzene is a typical example; in this case a chlorine atom replaces a hydrogen atom in the benzene molecule.

substrate. (1) A substance upon which an enzyme or ferment acts. (2) Any solid surface on which a coating or layer of a different material is deposited.

subtillin. An antibiotic produced by the metabolic processes of a strain of *Bacillus subtilis*. It is a cyclic polypeptide similar to bacitracin in chemical structure and antibiotic activity, but not as important clinically. Subtillin is active against many gram-positive bacteria, some gram-negative cocci, and some species of fungi. It is a surface tension depressant, and its antibiotic action is increased by use of wetting agents.

Properties: Soluble in water in pH range 2.0–6.0; soluble in methanol and ethanol (up to 80%); insoluble in dry ethanol or other common organic solvents. Relatively stable in acid solutions. Inactivated by pepsin and trypsin, and destroyed by light.

Uses: Medicine; seed disinfectant.

succinaldehyde (butanedial) $OHCCH_2CH_2CHO$.

Properties: Liquid; sp. gr. 1.064 (20/4°C); b.p. 169–170°C. Refractive index 1.4254. Soluble in water, alcohol, and ether. The name succinaldehyde is often incorrectly used in commerce as a synonym for succinic anhydride.

succinic acid (butanedioic acid) $CO_2H(CH_2)_2CO_2H$.

Properties: Colorless crystals; slightly soluble in water; soluble in alcohol and ether; odorless; acid taste. Sp. gr. 1.552; m.p. 185°C; b.p. 235°C. Combustible. Low toxicity.

Derivation: Fermentation of ammonium tartrate.

Grades: Technical; C.P.; F.C.C.

Containers: Bottles, barrels; kegs; fiber drums.

Uses: Medicine; organic synthesis; manufacture of lacquers, dyes, esters for perfumes, succinates; photography; in foods as a sequestrant, buffer, neutralizing agent.

succinic acid, 2,2-dimethylhydrazide $(CH_3)_2NNHCOCH_2CH_2COOH$.

Properties: White crystals; m.p. 155°C; pH 3.8 (500

ppm); soluble in water; insoluble in simple hydrocarbons.

Use: Growth retardant used in greenhouses; retards premature fruit drop.

succinic acid peroxide ($\text{HOOCCH}_2\text{CH}_2\text{CO}_2\text{O}_2$).

Properties: Fine white, odorless powder; m.p. 125°C (dec). Moderately soluble in water; insoluble in petroleum solvents and benzene.

Hazard: Moderately toxic by ingestion and inhalation; irritant to skin. Fire risk in contact with combustible materials.

Uses: Polymerization catalyst; deodorants; antiseptics.

Shipping regulations: (Rail) (Air) Yellow label. Organic Peroxide label.

succinic anhydride (2,5-diketotetrahydrofuran; succinyl

oxide; butanedioic anhydride) $\text{H}_2\text{C}(\text{O})\text{OC}(\text{O})\text{CH}_2$.

Properties: Colorless or light-colored needles or flakes; sp. gr. 1.104 ($20/4^\circ\text{C}$); m.p. 120°C ; b.p. 261°C . Soluble in alcohol and chloroform; insoluble in water.

Sublimes at 115°C at 5 mm pressure. Combustible.

Grade: Distilled.

Containers: 250-lb drums; carlots.

Hazard: Moderately toxic and irritant.

Uses: Manufacture of chemicals, pharmaceuticals, esters; hardener for resins.

succinimide (2,5-diketopyrrolidine)

$\text{H}_2\text{C}(\text{O})\text{NHC}(\text{O})\text{CH}_2$ or $\text{C}_4\text{H}_5\text{O}_2\text{N} \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals or thin light tan flakes; nearly odorless; sweet taste; m.p. $125\text{--}127^\circ\text{C}$; b.p. $287\text{--}288^\circ\text{C}$; sp. gr. 1.41. Soluble in hot and cold water and in sodium hydroxide solution; slightly soluble in alcohol; insoluble in ether and chloroform.

Derivation: Conversion of succinic acid to succinamide, followed by heating; ammonia splits off to give a diacyl-substituted derivative (succinimide).

Grades: Purified; technical.

Uses: Growth stimulants for plants; organic synthesis.

succinodimide. See N-iodosuccinimide.

succinonitrile. See ethylene cyanide.

succinyl oxide. See succinic anhydride.

sucrase. See invertase.

sucroblanc. A mixture used to defecate and bleach sugar solution in one operation. Contains high-test calcium hypochlorite, calcium superphosphate, lime and Filtercel (a grade of "Celite.")

sucrose (table sugar; saccharose) $\text{C}_{12}\text{H}_{22}\text{O}_{11}$.

Properties: Hard, white, dry crystals, lumps or powder; sweet taste; odorless. Soluble in water; slightly soluble in alcohol. Solutions are neutral to litmus. Sp. gr. 1.5877; decomposes $160\text{--}186^\circ\text{C}$. Combustible; nontoxic; optical rotation $+33.6^\circ$.

Derivation: By crushing and extraction of sugar cane (*Saccharum officinarum*) with water or extraction of the sugar-beet (*Beta vulgaris*) with water, evaporating and purifying with lime, carbon and various liquids. Also obtainable from sorghum by conventional methods. Occurs in low percentages in honey and maple sap.

Grades: Reagent; U.S.P.; technical; refined.

Containers: Multiwall paper sacks; bulk.

Uses: Sweetener in foods and soft drinks; manufacture of syrups; source of invert sugar; confection-

ery; preserves and jams; demulcent; pharmaceutical products; caramel; chemical intermediate for detergents; emulsifying agents and other sucrose derivatives.

See also sugar.

sucrose acetate isobutyrate (SAIB)

$(\text{CH}_3\text{COO})_2\text{C}_2\text{H}_4\text{O}_2[\text{OOCCH}(\text{CH}_3)]_2$.

Properties: Clear sucrose derivative available either as a semi-solid (100%), or as a 90% solution in ethyl alcohol. Sp. gr. 1.146 ($25/25^\circ\text{C}$). Combustible; nontoxic.

Derivation: By controlled esterification of sucrose with acetic and isobutyric anhydrides.

Containers: 55-gal drums; tanks.

Uses: Modifier for lacquers, hot-melt coating formulations, extrudable plastics.

sucrose monostearate.

Properties: Odorless, tasteless white powder.

Derivation: By reaction of sugar and methyl stearate in a suitable solvent and with potassium carbonate catalyst.

Uses: Low foam nonionic detergent; surfactants.

sucrose octaacetate $\text{C}_{12}\text{H}_{14}\text{O}_8(\text{OOCCH}_3)_8$.

Properties: White, hygroscopic, crystalline material.

Bitter taste. When once melted does not recrystallize on cooling but becomes a transparent film. Molten film is very adhesive but this property is lost on cooling. Rate of hydrolysis, practically nil. Gives no action with Fehling's solution. Soluble in acetic acid, acetone, benzene; slightly soluble in water. Sp. gr. 1.28 (fused) ($20/20^\circ\text{C}$); b.p. 260°C (0.1 mm); m.p. $79\text{--}84^\circ\text{C}$; refractive index 1.4660 (20°C); decomposes above 285°C ; viscosity (100°C) 29.5 poises; specific rotation (CCl_4) $+54.96^\circ\text{C}$. Combustible; low toxicity.

Grades: Technical; reagent; denaturing.

Containers: Bags; drums; 200-lb barrels.

Uses: Plasticizer for cellulose esters and synthetic resins; adhesive compositions; coating compositions; insecticide; termite repellent; denaturant in rubbing alcohol formulas; paper; plastics; lacquers.

"Sudafed."³⁰¹ Trademark for pseudoephedrine hydrochloride (q.v.).

"Sudan."³⁰⁷ Trademark for a series of dyestuffs; soluble in hydrocarbons; used for coloring fats, oils, waxes, etc.

"Suganilla."¹⁴² Trademark for concentrated extracts of vanilla beans adsorbed on sugar for food-flavoring.

sugar. A carbohydrate (q.v.) product of photosynthesis comprised of one, two, or more saccharose groups. The monosaccharide sugars (often called simple sugars) are composed of chains of from 2 to 7 carbon atoms. One of the carbons carries aldehydic or ketonic oxygen which may be combined in acetal or ketal forms. The remaining carbons usually have hydrogen atoms and hydroxyl groups. Chief among the monosaccharides are glucose (dextrose) and fructose (levulose). These are optical isomers of formula $\text{C}_6\text{H}_{12}\text{O}_6$, i.e., their crystals have the property of rotating to either left or right under polarized light. Hence the alternate names dextrose and levulose. (See also D, and optical rotation).

Among the disaccharides are sucrose (cane or beet sugar) (q.v.); lactose, found in milk; maltose, obtained by hydrolysis of starch; and cellobiose from

partial hydrolysis of cellulose. High-polymer sugars occur as water-soluble gums such as arabic, tragacanth, etc. Hydrolysis of sucrose yields invert sugar, composed of equal parts fructose and glucose. If on a scale of relative sweetness sucrose has an assigned value of 100, ten per cent solutions have the following values: fructose 120, glycerol 77, glucose 69, and lactose 39. Sugar is an important source of metabolic energy in foods, and its formation in plants is an essential factor in the life process.

sugar-cane wax. A hard wax varying from dark green to tan and brown; produced by solvent extraction of cane. M.p. 76–79°C. Combustible; nontoxic.

Grades: Domestic refined, in slabs.

Containers: Cartons.

Uses: Carbon paper; pigment disperser, castings, lubricant for plastics in food wrappers.

sugar, corn. See dextrose.

sugar, grape. See dextrose.

sugar, invert. See invert sugar; sugar.

sugar of lead. See lead acetate.

sugar of milk. See lactose.

sugar, reducing. Sugars that will reduce Fehling's solution or similar test liquids, with conversion of the blue soluble copper salt to a red, orange or yellow precipitate of cuprous oxide. Glucose and maltose are typical examples of reducing sugars, their molecules containing an aldehyde group that is the basis for this type of reaction.

sugar substitute. See sweetener, nonnutritive.

sulfa drug. Any of a group of compounds characterized by the presence of both sulfur and nitrogen, with high specificity for certain bacteria. Because of their toxicity and often serious side effects, their use in treating disease is limited, since the less toxic antibiotics are generally available. Many are used in veterinary medicine. Among the best known are sulfanilimide, sulfadiazine, sulfapyridine, sulfamerazine, sulfasoxazole, and gantrisin.

"Sulfads."⁶⁹ Trademark for a preparation of dipentamethylene thiuram tetrasulfide. Used as a curing agent for rubber.

sulfamic acid HSO_3NH_2 .

Properties: White crystalline solid; non-volatile; non-hygroscopic; sp. gr. 2.1; m.p. 205°C (decomposes). Moderately soluble in water; slightly soluble in organic solvents. Odorless. Aqueous solutions are highly ionized, giving pH values lower than solutions of formic, phosphoric, and oxalic acids. All the common salts (including calcium, barium, and lead) are extremely soluble in water. Combustible; low toxicity.

Grades: Reagent; crystalline; granular.

Containers: Fiber drums; carlots.

Uses: Metal and ceramic cleaning; nitrite removal in azo dye operations; gas-liberating compositions; organic synthesis; analytical acidimetric standard; amine sulfamates used as plasticizers and fire retardants for paper and other cellulose; stabilizing agent for chlorine and hypochlorite in swimming pools, closed water systems; bleaching paper pulp and textiles; catalyst for urea-formaldehyde resins.

"Sulfan."⁵⁰ Trademark for stabilized sulfuric anhydride. A colorless liquid; m.p. 17°C; b.p. 45°C. An efficient sulfonating agent used in the production of water-soluble and oil-soluble detergents. Also used

in the preparation of organic intermediates for pharmaceuticals, dyestuffs and other products.

Containers: Glass ampules, steel drums, tank cars.

Grades: 99.5% of SO_3 min, stabilized to retain 17°C melting point.

sulfanilic acid (para-aminobenzenesulfonic acid; para-anilinesulfonic acid) $\text{H}_2\text{NC}_6\text{H}_4\text{SO}_3\text{H} \cdot \text{H}_2\text{O}$.

Properties: Grayish white, flat crystals. Soluble in fuming hydrochloric acid; slightly soluble in water; very slightly soluble in alcohol and ether. M.p., chars at 280–300°C. Combustible; low toxicity.

Derivation: By heating aniline with weak fuming sulfuric acid and pouring the reaction product into water.

Grades: Technical; pure; reagent.

Containers: Bottles; drums.

Uses: Dyestuffs; organic synthesis; medicine.

meta-sulfanilic acid. See metanilic acid.

sulfanilylbutylurea. See 1-butyl-3-sulfanilylurea.

"Sulfanole."⁴² Trademark for a group of sulfonated detergents used in the textile industry.

"Sulfanthrene."²⁸ Trademark for a group of thioindigoid vat dyes characterized by good fastness properties. Used principally for the dyeing and printing of cotton and rayon.

"Sulfasan" R.⁵⁸ Trademark for 4,4'-dithiodimorpholine (q.v.).

"Sulfatate B-1."⁷³ Trademark for a hydrocarbon sulfonate used as a wetting agent.

sulfate pulp. See pulp, paper.

sulfenamide. A compound having the typical structure RSNH_2 .

sulfide dye (sulfur dye). One of a group of dyes produced by heating various organic compounds with sulfur. The characteristic chromophore groupings are $\text{C}=\text{S}-\text{C}=\text{C}$ and $\text{C}=\text{S}-\text{S}-\text{C}=\text{C}$. CI numbers range from 53000–54999. Application is usually to cotton from a sodium sulfide bath. Sulfur black (CI No. 53185) is an important example.

sulfite acid liquor. An aqueous solution of calcium bisulfite or calcium and magnesium bisulfites containing a large amount of free sulfur dioxide. It is prepared from sulfur dioxide and limestone, dolomite or lime by countercurrent extraction.

Use: Manufacture of sulfite pulp for paper.

sulfite pulp. See pulp, paper.

sulfite waste liquor. A waste liquor produced in the sulfite paper process. Sold in variations from a dilute solution to a solid.

Uses: Foam producer; emulsifier; adhesives; tanning agent; binder for briquets, cores, unpaved roads; source of torula yeast.

See also lignin sulfonate; waste disposal.

meta-sulfobenzoic acid $\text{HO}_2\text{SC}_6\text{H}_4\text{COOH} \cdot 2\text{H}_2\text{O}$.

Properties: Grayish white solid; stable but hygroscopic in air; m.p. 98°C, anhydrous form melts at 141°C. Soluble in water, alcohol; insoluble in benzene.

Derivation: Direct sulfonation of benzoic acid with sulfur trioxide.

Use: Derivative for surface-active agents.

ortho-sulfobenzoic acid $\text{HO}_2\text{SC}_6\text{H}_4\text{COOH}$.

Properties: White needles. Soluble in water and alcohol; insoluble in ether. M.p. 68–69°C (with $3\text{H}_2\text{O}$ of crystallization); m.p. 134°C (dry).

Derivation: (a) From saccharin and concentrated hydrochloric acid; (b) by the oxidation of thiosalicylic acid, with potassium permanganate in alkaline solution.

Uses: Manufacture of sulfonaphthalein indicators; dyes.

ortho-sulfobenzoic anhydride $C_6H_4COOSO_2$.

Properties: Solid; m.p. 129.5°C; b.p. 184–186°C (18 mm). Soluble in hot water, ether, and benzene. Used as polymerization inhibitor.

"Sulfobetaines."⁵⁶⁰ Trademark for a group of ionic neutral surfactants, compatible with all other classes of surface-active agents. The "zwitterion" of the unusual series of compounds contains a quaternary ammonium ion and a sulfonic acid ion, arranged in a betaine-like inner salt structure.

Uses: Cosmetic soap bars, liquid hand soap, soap-based shampoos, germicidal soap preparations, and soap-based laundry preparations.

sulfocarbanilide. See thiocarbanilide.

sulfocarboic acid. See phenolsulfonic acid.

1-(4-sulfo-2,3-dichlorophenyl)-3-methylpyrazolone
($Cl_2C_6H_3SO_3H$) $NNC(CH_3)CH_2CO$.

Properties: White or yellowish powder or crystals. Very soluble in water; soluble in alkalis.

Derivation: By condensation of dichlorophenylhydrazine sulfonic acid with ethylacetoacetate.

Use: Intermediate for dyes.

"Sulfogene."²⁸ Trademark for a series of sulfur colors. Used extensively on cotton work-clothing and similar fabrics and to a limited extent on rayon and other materials.

sulfolane (tetrahydrothiophene 1,1-dioxide; tetramethylene sulfone) $CH_2CH_2CH_2CH_2SO_2$.

Properties: Usually a liquid; sp. gr. 1.261 (30/4°C); m.p. 27°C; b.p. 285°C; refractive index 1.481 (30°C); flash point 350°F (open cup). Miscible with water, acetone, and toluene. A highly polar compound with outstanding solvent properties. Combustible.

Derivation: By the reaction of sulfur dioxide with butadiene to form sulfolene, which is then hydrogenated.

Uses: Extraction of aromatic hydrocarbons from oil refinery streams; fractionation of wood tars, tall oil, and other fatty acids; polymerization solvent; plasticizer; component of hydraulic fluid; textile finishing.

"Sulfol."³⁰³ Trademark for group of high-quality thiols ranging from C_4 to C_{16} . Derived by the catalytic addition of hydrogen sulfide to petroleum olefins.

Uses: Rubber and plastics industries as modifiers for "hot" and "cold" rubber, nitrile rubber, and certain types of plastics.

sulfolene. See 2,5-dihydrothiophene-1,1-dioxide.

sulfonamide. A compound having the typical structure RSO_2NH_2 . Used as anti-infective agents in medicine. Their use is restricted by FDA. See sulfa drug.

"Sul-fon-ate."³⁴⁴ Trademark for a series of anionic wetting agents.

AA9 and AA10. Crisp, white flakes of sodium dodecyl benzene sulfonate.

OA-5. Light brown liquid of sulfonated oleic acid, sodium salt.

sulfonated castor oil. See Turkey red oil.

sulfonated oil. A vegetable or animal oil which has been treated with sulfuric acid and the excess of acid washed out and the oil neutralized with a small amount of caustic soda or ammonia. These oils are soluble (emulsifiable) in water and are claimed to be capable of: (1) supplying lubrication for various purposes; (2) emulsifying (dispersing) in water various other materials; (3) plasticizing; (4) defoaming; (5) dispersing; (6) penetrating; (7) scouring; (8) wetting out; and (9) softening. For some of these operations specially formulated oils may be necessary.

sulfonation. The formation of a sulfonic acid, i.e., a compound containing the $-SO_3OH$ group. The conversion of benzene (C_6H_6) into benzenesulfonic acid ($C_6H_5SO_3OH$) is an example. Common sulfonating agents are: concentrated sulfuric acid, fuming sulfuric acid, sulfur trioxide, alkali disulfates, pyrosulfates, chlorosulfonic acid and a mixture of manganese dioxide and sulfurous acid.

Para-sulfondichloraminobenzoic acid. See halazone.

sulfonyl bisphenol. See dihydroxydiphenyl sulfone.

sulfonyl chloride. See sulfuryl chloride.

4,4'-sulfonyldianiline (DDS; dapson; 4,4'-diaminodiphenyl sulfone) $C_6H_4NH_2)_2SO_2$.

Properties: White or creamy white, crystalline powder; odorless; slightly bitter taste. Very slightly soluble in water; freely soluble in alcohol; soluble in acetone and dilute mineral acids. Melting range between 175° and 181°C.

Grades: U.S.P. (as dapson, the USAN name); technical.

Hazard: Toxic by ingestion.

Uses: Curing agent for epoxy resins; medicine.

para-1-sulfophenyl-3-methyl-5-pyrazolone
($C_6H_4SO_3H$) $NNC(CH_3)CH_2CO$.

Properties: White or yellowish powder. Very slightly soluble in water; soluble in alkalis.

Derivation: By condensation of phenylhydrazine sulfonic acid with ethylacetoacetate.

4-sulphophthalic anhydride $HO_2SC_6H_4(CO)_2O$.

Properties: Reddish brown syrup; crystallizes partially on long standing; hygroscopic; fluorescent in solution under ultraviolet radiation; sp. gr. 1.62 (25°C). Very soluble in water, alcohol; insoluble in ether, benzene. Combustible.

Uses: Esters of 4-sulphophthalic acid used in wetting, cleansing, emulsifying, softening and equalizing agents with textiles. Derivatives have application as surface-active agents.

"Sulforon X."²⁵ Trademark for a microfine sulfur used as a fungicide in a water spray.

5-sulfosalicylic acid $C_6H_4OH(SO_3OH)COOH \cdot 2H_2O$.

Properties: Colorless crystals; colored pink by traces of iron. Very soluble in water. M.p. 120°C; decomposes at higher temperatures.

Derivation: Action of sulfuric acid on salicylic acid.

Uses: Reagent for albumin; colorimetric reagent for ferric iron; intermediate for dyes, surfactants, catalysts, grease additives.

sulfotepp. Generic name for ethyl thiopyrophosphate (tetraethyl dithiopyrophosphate) $(C_2H_5O)_2P(S)OP(S)(OC_2H_5)_2$.

Properties: Yellow liquid; b.p. 136–139°C (2 mm). Slightly soluble in water; soluble in most organic solvents.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: (Rail, Air) Poison label. Not accepted on passenger planes. Legal label name: tetraethyl dithiopyrophosphate. Consult regulations for details.

sulfoxide. Generic name for 1,2-(methylenedioxy)-4-[2-(octylsulfinyl)propyl]benzene (n-octyl sulfoxide isosafrole) $C_{18}H_{28}O_3S$.

Properties: Brown liquid; insoluble in water; slightly soluble in oils; miscible with most organic solvents.

Use: Insect synergist.

"Sulframin."¹⁴⁹ Trademark for a series of alkylaryl sulfonates.

"Sulfricrin."²⁰² Trademark for a modified castor oil of increased hydroxyl content used for sulfonation.

sulfur S Nonmetallic element, atomic number 16, group VIA of periodic system. Atomic weight 32.06. Valences 2, 4, 6. Four stable isotopes.

Properties: Pure sulfur exists in two stable crystalline forms (a) and (b) and at least two amorphous (liquid) forms.

(a) Alpha-sulfur, rhombic, octahedral yellow crystals stable at room temperature. Sp. gr. 2.06; transition to beta form 94.5°C; m.p. (rapid heating) 112.8°C; refractive index 1.957.

(b) Beta-sulfur, monoclinic, prismatic pale yellow crystals slowly changing to alpha form below 94.5°C. Sp. gr. 1.96; m.p. 119°C; b.p. 444.6°C; flash point 405°F; autoignition temp. 450°F. Index of refraction 2.038. Both forms are insoluble in water; slightly soluble in alcohol and ether; soluble in carbon disulfide, carbon tetrachloride, and benzene. Combustible; nontoxic.

Occurrence: Native in Texas; Louisiana; Sicily; Canada (Alberta); Poland; Saudi Arabia; Mexico; Iraq; offshore deposits in Gulf of Mexico; U.S.S.R.; Japan.

Derivation: Direct mining by Frasch process (q.v.); low-grade ores by Chemico process (q.v.); smelter waste gas; sour natural gas; iron pyrites; gypsum; solvent extraction of volcanic ash; petroleum; coke oven gas by Thylox process (q.v.).

Grades: Technical (lumps, roll, flour); rubber makers; N.F. (sublimed); crude; refined; precipitated (milk of sulfur); high purity (impurities less than 10 ppm).

Containers: Bags; barrels; bulk in carloads and barges; molten, in steam-heated pipelines.

Hazard: Fire and explosion risk in finely divided form. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Sulfuric acid manufacture; pulp and paper manufacture; carbon disulfide; rubber vulcanization; dyes and chemicals; drugs and pharmaceuticals; explosives; insecticides; rodent repellents; soil conditioner; fungicide; coating for controlled-release fertilizers; nucleating agent for photographic film; cement sealant (crack repair in airport runways); road paving compositions (experimental).

For further information refer to Sulfur Institute, 1725 K St. N.W., Washington, D.C.

sulfur 35. Radioactive sulfur of mass number 35.

Properties: Half-life 87.1 days; radiation, beta; radiotoxicity, moderately hazardous.

Derivation: By pile irradiation of elemental sulfur or of various chlorides.

Forms available: Solid elemental sulfur; sulfate in weak hydrochloric acid; barium sulfide in barium hydroxide solution; elemental sulfur in benzene solution; in tagged compounds such as carbon disulfide, chlorosulfonic acid, thiourea, sulfanilamide, thiamine, heparin, insulin, "Sucaryl," etc.

Hazard: Radioactive poison.

Uses: Research tool in studying mechanism of rubber vulcanization and polymerization of synthetic rubber; role of sulfur in the coking process and in steel; effect of sulfur on engine wear; sulfur removal in the viscose process; behavior of detergents during washing; sulfur deposition in diesel engines; action of sulfur in silver plating solutions; protein metabolism; surface active agents and surface phenomena; drug actions; etc.

Shipping regulations: (Rail, Air) Consult regulations.

sulfurated lime. See lime, sulfurated.

sulfurated potash. See potash, sulfurated.

sulfur bromide (sulfur monobromide) S_2Br_2 .

Properties: Yellow liquid. Becomes red when exposed to air. Decomposed by water. Soluble in carbon disulfide. Sp. gr. 2.6 (15°C); f.p. -40°C; b.p. 54°C (0.2 mm).

Hazard: Avoid inhalation of fumes. Strong irritant to tissue.

sulfur chloride (sulfur subchloride; sulfur monochloride) S_2Cl_2 .

Properties: Amber to yellowish red, oily, fuming liquid; penetrating odor. Soluble in alcohol, ether, benzene, carbon disulfide and amyl acetate; decomposes on contact with water. Sp. gr. 1.690 (15.5°C); f.p. -80°C; b.p. 138°C; flash point 266°F. Combustible.

Derivation: By passing chlorine over molten sulfur.

Method of purification: Distillation.

Containers: Carboys; drums; tank cars.

Hazard: Highly toxic by inhalation and ingestion; strong irritant to tissue. Reacts violently with water in a closed vessel. Tolerance, 1 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Chemicals (sulfur solvent, acetic anhydride, thionyl chloride, carbon tetrachloride from carbon disulfide, various chlorohydrins from glycerol, glycol, etc.); analytical reagent; rubber vulcanizing; vulcanized oils; purifying sugar juices; military poison gas; insecticide; hardening soft woods (by treatment with sulfur chloride dissolved in carbon disulfide); pharmaceuticals; textile finishing and dyeing; extraction of gold from its ores.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

sulfur dichloride SCl_2 .

Properties: Reddish brown fuming liquid with pungent chlorine odor. Sp. gr. 1.638 (15.5°C); f.p. -78°C; b.p. decomposes above 59°C; on rapid heating, boils near 60°C; decomposes in water, and alcohol; soluble in benzene; refractive index 1.567 (n_D²⁰); noncombustible.

Derivation: Chlorine is passed into sulfur monochloride to saturation, at 6° to 10°C, followed by carbon dioxide to drive off the excess chlorine.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Highly toxic by inhalation and ingestion; strong irritant to tissue. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: In general, as a chlorine carrier or chlorinating agent; rubber vulcanizing; vulcanized oils; purifying sugar juices; sulfur solvent; chloridizing agent in metallurgy; manufacture of organic chemicals and insecticides.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

sulfur dioxide SO_2 .

Properties: Colorless gas or liquid with sharp pungent odor. Soluble in water, alcohol, and ether. Forms sulfurous acid H_2SO_3 . Sp. gr. 1.4337, liquid at 0°C ; f.p. -76.1°C ; b.p. -10°C ; vapor pressure 3.2 atmosphere at 68°F ; refractive index (liquid) 1.410 (n_D²⁰). An outstanding oxidizing and reducing agent. Noncombustible.

Derivation: (a) By roasting pyrites in special furnaces. The gas is readily liquefied by cooling with ice and salt, or at a pressure of 3 atm. (b) By purifying and compressing sulfur dioxide gas from smelting operations. (3) By burning sulfur.

Graded: Commercial; U.S.P.; technical; refrigeration; anhydrous 99.98% min.

Containers: 2- to 300-lb pressure cylinders; ton drums on multi-unit cars; 40,000-lb tank cars.

Hazard: Toxic by inhalation; strong irritant to eyes and mucous membranes, especially under pressure. Dangerous air contaminant and constituent of smog. Tolerance, (for industrial air spaces), 5 ppm; U.S. atmospheric standard, 0.140 ppm. Not permitted in meats and other sources of vitamin B₁. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Chemicals (sulfuric acid, salt cake, sulfites, hydrosulfites of potassium and sodium, thiosulfates, alum from shale, recovery of volatile substances); sulfite paper pulp; ore and metal refining; soybean protein; intermediates; solvent extraction of lubricating oils; bleaching agent for oils, foods; sulfonation of oils; disinfecting and fumigating; food additive (inhibition of browning, of enzyme-catalyzed reactions, bacterial growth); preservation of grapes; reducing agent; antioxidant.

Shipping regulations: (Rail) Green label. (Air) Non-flammable Gas label. Not accepted on passenger planes.

sulfur dye. See sulfide dye.

sulfuretted hydrogen. See hydrogen sulfide.

sulfur hexafluoride SF_6 .

Properties: Colorless gas; f.p. -64°C (sublimes); density 6.5 grams per liter; sp. gr. liquid 1.67; specific volume 2.5 cu ft/lb (70°F); slightly soluble in water; soluble in alcohol and ether. Odorless, noncombustible, low toxicity.

Containers: 60-lb cylinders.

Hazard: Tolerance, 1000 ppm in air.

Use: Dielectric (gaseous insulator for electrical equipment and radar wave guides).

Shipping regulations: (Rail) Green label. (Air) Non-flammable Gas label.

sulfuric acid (hydrogen sulfate, battery acid) H_2SO_4 . By far the most widely used industrial chemical; its production is approximately 60 billion pounds a year

in U.S. alone. Highest-volume chemical produced in U.S. (1975).

Properties: Strongly corrosive, dense, oily liquid; colorless to dark brown depending on purity. Miscible with water in all proportions. Very reactive, dissolves most metals; concentrated acid oxidizes, dehydrates, or sulfonates most organic compounds, often causes charring. Sp. gr. of pure material 1.84; m.p. 10.4°C ; b.p. varies over range $315\text{--}338^\circ\text{C}$ due to loss of sulfur trioxide during heating to 300°C or higher.

Note: Use great caution in mixing with water due to heat evolution that causes explosive spattering. Always add the acid to water, never the reverse.

Derivation: From sulfur, pyrite (FeS_2), hydrogen sulfide and sulfur-containing smelter gases by the contact process (vanadium pentoxide catalyst). It can also be made from sulfur dioxide by the "Cat-Ox" process (q.v.) and from gypsum (calcium sulfate).

Grades: Commercial; 60°Bé (sp. gr. 1.71, 77.7% H_2SO_4); 66°Bé (sp. gr. 1.84, 93.2% H_2SO_4); 98°Bé (sp. gr. 1.84); 99% (sp. gr. 1.84); 100% (sp. gr. 1.84) depending on supplier; reagent A.C.S.; C.P.

Containers: Bottles, carboys, drums, tank trucks, tank transports, tank cars, tank barges. Lined equipment used for chemically pure shipments.

Hazard: Highly toxic; strong irritant to tissue. Tolerance, 1 mg per cubic meter of air. See note above. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Fertilizers; chemicals; inorganic pigments; petroleum refining; etchant; alkylation catalyst; electroplating baths; iron and steel; rayon and film; industrial explosives; laboratory reagent; nonferrous metallurgy.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

See also sulfuric acid, fuming.

sulfuric acid, fuming (oleum; $x\text{H}_2\text{SO}_4 \cdot y\text{SO}_3$). A solution of sulfur trioxide in sulfuric acid.

Properties: Heavy, oily liquid. Colorless to dark brown depending on purity. Fumes strongly in moist air. Extremely hygroscopic.

Derivation: Sulfur trioxide produced by the contact process (q.v.) is absorbed in concentrated sulfuric acid.

Grades: Commercial (10% to 70% free SO_3 , depending on supplier); C.P.

Containers: Bottles, drums, tank cars, tank trucks, tank transports, tank barges.

Hazard: Highly toxic; strong irritant to tissue. (Reacts violently with water). Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Sulfating and sulfonating agent; dehydrating agent in nitrations; dyes; explosives; petroleum refining; laboratory reagent.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

sulfuric anhydride. See sulfur trioxide.

sulfuric chloride. See sulfonyl chloride.

sulfuric oxychloride. See sulfonyl chloride.

sulfur monobromide. See sulfur bromide.

sulfur monochloride. See sulfur chloride.

sulfurous acid. A solution of sulfur dioxide in water.

The formula H_2SO_3 is used, but the acid is known only through its salts.

Properties: Colorless liquid; suffocating sulfur odor.

Sp. gr. about 1.03; unstable. Soluble in water.

Derivation: Absorption of sulfur dioxide in water.

Grades: Technical; C.P.

Containers: Carboys; drums.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to tissue.

Uses: Organic synthesis; bleaching straw and textiles, etc.; paper manufacture; wine manufacture; brewing; metallurgy; ore flotation; medicine; reagent in analytical chemistry; sulfites; as preservative for fruits, nuts, foods, wines; disinfecting ships; refining crude oils and paraffins.

sulfur oxychloride. See thionyl chloride.

sulfur subchloride. See sulfur chloride.

sulfur tetrafluoride SF_4 .

Properties: A gas; f.p. -124°C ; b.p. -40°C ; decomposes in water. Noncombustible.

Grade: Available in cylinders at 90-94% purity.

Hazard: Highly toxic by inhalation; strong irritant to eyes and mucous membranes. Tolerance, 0.1 ppm in air.

Uses: Fluorinating agent for making water and oil repellents, and lubricity improvers.

Shipping regulations: (Air) Nonflammable Gas label. Not acceptable on passenger planes.

sulfur trioxide (sulfuric anhydride) SO_3 ; $(\text{SO}_3)_n$.

Properties: Exists in three solid modifications; alpha, m.p. 62°C ; beta, m.p. 32.5°C ; gamma, m.p. 16.8°C . The alpha form appears to be the stable form but the solid transitions are commonly slow; a given sample may be a mixture of the various forms, and its m.p. not constant. The solids sublime easily. All three forms boil at 45°C .

Derivation: Passing a mixture of SO_2 and O_2 over a heated catalyst such as platinum or vanadium pentoxide.

Hazard: Highly toxic; strong irritant to tissue. Oxidizing agent. Fire risk in contact with organic materials. An explosive increase in vapor pressure occurs when the alpha form melts. The anhydride combines with water, forming sulfuric acid and evolving a large amount of heat.

Containers: (Stabilized, liquid) 750-lb drums; tank cars.

Uses: Sulfonation of organic compounds, especially nonionic detergents, solar energy collectors. It is usually generated in the plant where it is to be used.

Shipping regulations: (Stabilized) (Rail) White label. (Air) (Beta or gamma, stabilized) Corrosive label. (Beta or gamma, not stabilized, and alpha with or without stabilizer) Not acceptable.

sulfuryl chloride (chlorosulfuric acid; sulfonyl chloride; sulfuric chloride; sulfuric oxychloride) SO_2Cl_2 .

Properties: Colorless liquid. Pungent odor. Rapidly decomposed by alkalis and by hot water. Soluble in glacial acetic acid. Sp. gr. 1.667 at 20°C ; b.p. 69.2°C ; f.p. -54°C ; vapor density 4.6.

Derivation: (a) By heating chlorosulfonic acid in the presence of catalysts. (b) From sulfur dioxide and chlorine in the presence of either activated carbon or camphor.

Grades: Technical.

Containers: 5-gal carboys; 55-gal drums; 725-lb drums.

Hazard: Highly toxic; strong irritant to tissue. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Organic synthesis (chlorinating agent, dehydrating agent; acylating agent) pharmaceuticals; dyestuffs; rubber-base plastics; rayon; poison gases; solvent; catalyst.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

sulfuryl fluoride SO_2F_2 .

Properties: Colorless gas; f.p. -136.7°C ; b.p. -55.4°C . Slightly soluble in cold water and most organic solvents. Noncombustible.

Containers: Steel cylinders.

Hazard: Toxic by inhalation. Tolerance, 5 ppm in air.

Uses: Insecticide; fumigant.

Shipping regulations: (Rail) Green label. (Air) Nonflammable Gas label.

"Sulphon."³⁰⁷ Trademark for acid dyestuffs used on wool and silk; fair to good fastness to light, good fastness to washing, etc. Can be used on leather and paper.

"Sulphonated Olevene."³⁰⁹ Trademark for a sulfonated synthetic olive oil; used for finishing textiles as a softener and plasticizer.

sultam acid. See 1,8-naphthosultam-2,4-disulfonic acid.

"Sumstar" 190.²¹² Trademark for a polymeric dialdehyde. A fine, nonvolatile, virtually odorless powder. Produced by highly specific periodate oxidation of the anhydroglucose units of starch. Bulk density 40 to 42 lb/cu ft.

Uses: Film-forming agents, adhesives, leather, and resins.

"Sunaptic."⁴⁹⁴ Trademark for three grades of naphthenic acids having an average molecular weight of 310, 340, and 415.

Uses: Plasticizers; corrosion and rust inhibitors; cleaning, defoaming, foaming, dispersing, emulsifying and wetting agents; metallic naphthenates.

"Sun Colors."¹³⁴ Trademark for a series of lightfast pigments resistant to heat and chemicals based on heavy metal modification of titanium dioxide.

"Sundex" Oils.⁴⁹⁴ Trademark for a series of aromatic process and extender oils. Recommended for rubber processing where color is not a problem.

Uses: Plasticizers, softeners.

sunflower cake. The presscake resulting from hydraulic pressure expression of sunflower seeds. Typical analysis: proteins 21.0%; fats 8.5%; fiber 48.9%; water 10.2%; ash 11.4%.

Containers: Bags; bulk.

Uses: Cattle food; fertilizer ingredient.

sunflower meal. The mealy form assumed by sunflower seeds after crushing and heating. If the oil cake is ground the product again is in this mealy form. It contains 55-60% protein.

Uses: Animal feed; fertilizers.

sunflower oil.

Properties: Pale yellow semidrying oil; mild taste; pleasant odor. Soluble in alcohol, ether, chloroform and carbon disulfide. Sp. gr. 0.924-0.926; iodine value 130-135; refractive index 1.4611. Nontoxic. Combustible.

Chief constituents: Mixed triglycerides of linoleic, oleic and other fatty acids.

Derivation: By expression from the seeds of *Helianthus annuus*.

Method of purification: Filtration.

Grades: Crude; refined.

Containers: Barrels; steel drums; tank cars.

Uses: Modified alkyd resins; soap; edible oil; margarine; shortening.

"Sunolite."¹⁰⁴ Trademark for waxes used to prevent disintegration of rubber stocks which are constantly exposed to the atmosphere.

"Sunolith."²⁹⁶ Trademark for a pigment consisting of various types of lithopone.

"Sunolox."²⁰⁴ Trademark for a formulation designed to promote the stability of hydrogen peroxide bleach solutions.

Use: Bleaching of textiles near the neutral point; softness is improved by low silicate content.

"Sunpar."⁴⁹⁴ Trademark for a series of nonstaining paraffinic oils. Recommended for use with ethylene-propylene copolymers. Used as plasticizers and softeners.

"Sunproof."²⁴⁸ Trademark for a series of protective waxes to prevent static atmospheric cracking in all types of synthetic and natural rubbers.

"Sunsize" 536A.⁴² Trademark for a complex of fiber-reactive, alkyl-substituted, synthetic nitrogen derivatives. Used as an internal size in textile industry in place of rosin-alum or rosin-alum-wax.

"Sunthene."⁴⁹⁴ Trademark for a series of nonstaining naphthenic oils. Used as plasticizers, softeners, and extenders.

"Superaid."²¹⁸ Trademark for diatomite filteraids; used in food and industrial processing.

"Super-Alkali."²⁹² Trademark for combinations of caustic soda and soda ash with varying percentages of the two basic ingredients.

Containers: 400-lb fiber drums; 400-lb steel drums.

Uses: Heavy-duty cleaning such as in metal cleaning and meat-packing houses.

superalloy. An iron-base, cobalt-base, or nickel-base alloy which combines high-temperature mechanical properties, oxidation resistance, and creep resistance to an unusual degree. Constitutions of these alloys are as follows: Iron-base: 10-45% nickel, 13-19% chromium, 1.3-6% molybdenum, balance iron. Cobalt-base: 0-26% nickel, 0-26% chromium, 0-15% tungsten, balance cobalt. Nickel-base: 55-75% nickel, 10-20% chromium, 0-6% aluminum, 0-5% titanium. All contain less than 0.5% carbon, plus other special ingredients. Superalloys can be used up to 2500°F. Uses: Jet engine parts; turbo-superchargers; extreme high-temperature applications.

"Super-Amide."¹²⁸ Trademark for high-activity fatty acid diethanolamines. Used as foam stabilizers, emulsifiers, thickeners.

"Superba."¹¹¹ Trademark for a medium high-color carbon black for automotive finishes, locomotive paints, high grade industrial work. Available in standard form and beads.

"Super-Beckacite."¹⁴ Trademark for a series of oil-soluble, oil-reactive, heat-hardening pure phenolic synthetic resins. Available in both foaming and non-foaming types.

Uses: Varnishes and enamels of the spar and marine types.

"Super-Beckamine."¹¹ Trademark for a group of melamine-formaldehyde resins.

"Super-Beckosol."³⁶ Trademark for a group of isophthalic acid alkyd resins for drying, flexibility, and high exterior durability paints and printing inks.

"Super Cat."⁷⁴ Trademark for a series of hydrogenation catalysts available in three stabilized flake forms (100, 200, 300). Used in edible oils, inedible oils and fatty acids.

"Super-CE."⁸⁸ Trademark for a cerium polish, consisting of cerium oxide and other ingredients.

"Superchrome."²⁴³ Trademark of acid mordant dyes for wool and synthetics.

superconductivity. The phenomenon that causes certain metals, alloys, and compounds near absolute zero to lose both electrical resistance and magnetic permeability, i.e., to have infinite electrical conductivity. Depending upon the substance, the maximum temperature (transition temperature) for the behavior is 0.5-18°K. Superconductivity does not occur in alkali metals, noble metals, ferro- and antiferromagnetic metals. It is well-known in elements having 3, 5, or 7 valence electrons per atom, and is associated with high room-temperature resistivity. A system for transmitting electric current underground by means of superconducting cables has been developed. See also cryogenics.

"Super Dylan."¹¹ Trademark for high-density polyethylene, made by Ziegler or low pressure process.

Uses: Molded items, extruded sheets, film, pipe, bottles, wire insulation, filaments, etc.

"Superresins."¹⁸⁸ Trademark for a series of standardized essential oil/oleoresin mixtures, designed to replace natural spices under prescribed conditions.

"Super-Fast."²⁴¹ Trademark for premium quality cerium oxide for ultrafast glass polishing.

"Superfine."¹ Trademark for a flour sulfur air-classified for delivery in two particle sizes, one 93% and the other 98% through a 325 U.S. Sieve.

Uses: Manufacture of glass, matches, chrome oxide pigments, sulfur cements, stock foods, pyrotechnics and explosives; refining of petroleum and casting magnesium and aluminum.

"Super-Foil."⁵²⁴ Trademark for aluminum and aluminum alloys in foil form.

"Superglo."¹⁰⁸ Trademark for a completely neutral, liquid synthetic detergent. Combination of highly active wetting agents and foam stabilizers. Soluble in hot and cold water.

"Superinone."¹⁶² Trademark for tyloxapol (q.v.).

"Superlith."²²¹ Trademark for imported zinc sulfide pigments.

Grades: Available as pure zinc sulfide, 60% zinc sulfide.

"Superloid."³²² Trademark for ammonium alginate, a hydrophilic colloid.

Uses: Suspending, thickening, emulsifying and stabilizing agent in creaming and bodying of rubber latex products; protective colloid in resin emulsion paints; adhesives; fire-retarding compositions; ceramics, etc.

"Superlose."¹¹¹ Trademark for amylose fraction of potato starch.

"Superlume."²¹¹ Trademark for a super-leveling bright nickel electroplating process on steel stampings, brass,

copper, zinc die castings, etc. The materials used are nickel sulfate, nickel chloride, boric acid and addition agents.

supernatant. A liquid or fluid forming a layer on the surface of another liquid.

superoxide. A compound characterized by the presence in its structure of the O_2^- ion. The O_2^- ion has an odd number of electrons (13) and, as a result, all superoxide compounds are paramagnetic. At room temperature they have a yellowish color. At low temperature many of them undergo reversible phase transitions accompanied by a color change to white. The stable superoxides are:

Sodium superoxide	NaO_2
Potassium superoxide	KO_2
Rubidium superoxide	RbO_2
Cesium superoxide	CsO_2
Calcium superoxide	$Ca(O_2)_2$
Strontium superoxide	$Sr(O_2)_2$
Barium superoxide	$Ba(O_2)_2$
Tetramethylammonium superoxide	$(CH_3)_4NO_2$

In these compounds each oxygen atom has an oxidation number of $-1/2$ instead of -2 , as a normal oxide.

"Supernilla."³⁴² Trademark for natural vanilla concentrate in liquid form.

"Superoxol."¹²³ Trademark for hydrogen peroxide (q.v.).

"Superpax."³³⁷ Trademark for 92 to 94.5% zirconium silicate with bulk density 68 lbs/cu ft; average particle size 5 microns max. Used in ceramic glazes and as a filler for resins and rubbers.

superphosphate (acid phosphate). The most important phosphorus fertilizer, made by the action of sulfuric acid on insoluble phosphate rock (essentially calcium phosphate, tribasic) to form a mixture of gypsum and calcium phosphate, monobasic. A typical composition is $CaH_4(PO_4)_3 \cdot H_2O$ 30%; $CaHPO_4$ 10%; $CaSO_4$ 45%; iron oxide, alumina, silica 10%; water 5%.

Typical analysis: Moisture 10-15%; available phosphoric acid (as P_2O_5) 18-21%; insoluble phosphoric acid 0.3-2%; total phosphoric acid (as P_2O_5) 19-23%. Grades: Based on available P_2O_5 .

Containers: Bags; bulk; multiwall paper sacks; carloads. Use: Fertilizer.

See also triple superphosphate and nitrophosphate.

superphosphoric acid. See polyphosphoric acid.

supersaturation. The condition in which a solvent contains more dissolved matter (solute) than is present in a saturated solution of the same components at equivalent temperature. Such solutions may occur, or can be made, when a saturated solution cools gradually so that nucleating crystals do not form. They are extremely unstable and will precipitate upon addition of even one or two crystals of the solute, or upon shaking or other slight agitation. Supersaturated solutions occur in the confectionery industry, e.g., in fudges, maple sugar, etc.

"Supersheen."²⁹² Trademark for caustic soda solution containing chelating agent and wetting agent.

Containers: Tank cars and tank trucks.

Hazard: Strong irritant to skin and tissue.

Uses: Bottle washing and food plant sanitation.

"Supersil."⁴³⁶ Trademark for ground silica. Available in standard grades from 100 to 325 mesh.

Uses: Manufacture of ceramics, porcelain enamel, scouring powders and buffing compounds, fiber glass,

autoclave concrete products, chemicals, asbestos products and for cementing deep oil wells.

"Supersilicate."²⁴⁴ Trademark for a compound consisting essentially of the formula, $1.5 Na_2O \cdot SiO_2 \cdot 5.5 H_2O$.

Uses: Laundry and metal cleaning; paint remover; concrete floor cleaner; base for cleaning compounds.

"Supersize."⁵⁵³ Trademark for hydroxyethyl corn starches.

"Super-sol."²⁵ Trademark for an odorless petroleum naphtha; a rapid-drying highly purified solvent.

Uses: Carrier for insecticides; preparation of odorless paints; cleaning compositions.

"Super Spectra."¹³³ Trademark for an impingement carbon black used for jet black enamel and lacquers requiring satin finish. Containers $6\frac{1}{4}$ -lb bags.

"Super Stod-Sol."²⁰⁰ Trademark for a petroleum solvent. Properties: Water-white; boiling range 310-353°F; sp. gr. 0.779 (60°F); wt/gal 6.49 lbs (60°F); flash point 102°F. Combustible.

Containers: Drums, tank wagon, tank cars.

Hazard: Moderate fire risk.

Uses: Dry-cleaning solvent.

See also Stoddard Solvent.

"Supralan."³⁰⁷ Trademark for metallized acid colors of good fastness and level dyeing properties.

"Supramine" XA.³⁰⁷ Trademark for a leather chemical, solubilized sulfur phenol condensate; 75% active.

"Supranol."³⁰⁷ Trademark for dyestuffs used on wool and silk. Good fastness to light, washing, and sea water. Can also be used on leather.

"Suprarenin."¹⁶² Trademark for synthetic epinephrine.

"Suprex."²⁸⁵ Trademark for a group of clays (sedimentary kaolins) from South Carolina.

"Surfacaine."¹⁰⁰ Trademark for cyclomethycaine (q.v.).

surface. In physical chemistry, the area of contact between two different phases or states of matter, e.g., finely divided solid particles and air or other gas (solid-gas); liquids and air (liquid-gas); insoluble particles and liquid (solid-liquid). Surfaces are the sites of the physicochemical activity between the phases that is responsible for such phenomena as adsorption, reactivity, and catalysis. The depth of a surface is of molecular order of magnitude. The term interface is approximately synonymous with surface, but it also includes dispersions involving only one phase of matter, i.e., solid-solid or liquid-liquid. See also interface, surface area, surface chemistry.

surface-active agent (surfactant). Any compound that reduces surface tension (q.v.) when dissolved in water or water solutions, or which reduces interfacial tension between two liquids, or between a liquid and a solid. There are three categories of surface active agents: detergents, wetting agents, and emulsifiers; all have the same basic chemical mechanism and differ chiefly in the nature of the surfaces involved. For further information see under these three entries; also see interface; surface chemistry.

surface area. The total area of exposed surface of a finely divided solid (powder, fiber, etc.) including irregularities of all types. Since activity is greatest at the surface, that is, the boundary between the particle and its environment, the larger the surface area of a given substance the more reactive it becomes. Thus reduction to small particles is a means of increasing the efficiency

of both chemical and physical reactions; for example, the coloring effect of pigments is increased by maximum size reduction. Carbon black is notable among solids for its huge surface area (as much as 18 acres a pound for some types); the activity of its surface accounts for its outstanding ability to increase the strength and abrasion resistance of rubber. The capacity of activated carbon to adsorb molecules of gases is due to this factor. Surface area is measured most accurately by nitrogen adsorption techniques.

surface chemistry. The observation and measurement of forces acting at the surfaces of gases, liquids, and solids or at the interfaces between them. This includes the surface tension of liquids (vapor pressure, solubility); emulsions (liquid/liquid interfaces); finely divided solid particles (adsorption, catalysis); permeable membranes and microporous materials; and biochemical phenomena such as osmosis, cell function and metabolic mechanisms in plants and animals. Surface chemistry has many industrial applications, a few of which are air pollution; soaps and synthetic detergents; reinforcement of rubber and plastics; behavior of catalysts; color and optical properties of paints; aerosol sprays of all types; monolayers and thin films, both metallic and organic. Outstanding names in the development of this science are Graham, Freundlich and W. Ostwald in the 19th century, and Harkins, Langmuir, LaMer, and McBain in the 20th. See also colloid chemistry.

surface tension. In any liquid, the attractive force exerted by the molecules below the surface upon those at the surface/air interface, resulting from the high molecular concentration of a liquid compared to the low molecular concentration of a gas. An inward pull, or internal pressure, is thus created which tends to restrain the liquid from flowing. Its strength varies with the chemical nature of the liquid. Polar liquids have high surface tension (water = 73 dynes/cm at 20°C); nonpolar liquids have much lower values (benzene = 29 dynes/cm, ethyl alcohol = 22.3 dynes/cm); thus they flow more readily than water. Mercury, with the highest surface tension of any liquid, (480 dynes/cm), does not flow, but disintegrates into droplets. See also interface; surface-active agent.

surfactant. See surface-active agent.

"Surfactol."²⁰² Trademark for a series of castor oil-derived nonionic surfactants.

Uses: Emulsifiers; defoamers; plasticizers; solubilizers for oils, dyes; lubricants; in emulsion paints, pigment dispersions, cosmetics and polishes.

"Surfseptic."²¹¹ Trademark for synthetic molding resins containing germicides.

"Surfex."²⁴⁴ Trademark for a high purity precipitated calcium carbonate (surface-coated).

Uses: Paints, plastics, rubber, inks.

"Surflo."²¹⁶ Trademark for a series of bactericides and scale inhibitors. "Surflo-B11" is a film-forming amine that acts as a corrosion inhibitor and bactericide in low pH water-base drilling muds. "Surflo-B33" is a bactericide for treating water-base packer fluids or oil field waters.

"Surfonic."¹¹⁷ Trademark for a series of nonionic, biodegradable, surface-active agents, described as alkoxy-polyethoxy-ethanols, the ethylene oxide adducts of primary or straight-chain alcohols.

Uses: Wetting agent; detergent; emulsifier; biodegradable intermediate for sulfation purposes.

"Surspac."²³³ Trademark for biological oxidation media, based on saran; used in aerobic treatment of wastewaters.

"Surfy-nol."¹⁴⁴ Trademark for a group of organic surface-active agents.

Properties: Acetylenic alcohols or glycols or their ethoxylated derivatives; waxy or powdered solids, or liquids; nonfoaming, nonionic. For example, "Surfy-nol" 61 is 3,5-dimethyl-1-hexyne-3-ol.

Containers: 55-gal phosphatized steel drums, except 82 grade (44-gal fiber drum), 5-gal and 1-gal cans.

Uses: Wetting and foam suppression; rinsing aids; viscosity reduction; detergent formulations; penetrating agents.

"Surlyn."²⁸ Trademark for a group of ionomer resins (q.v.).

Properties: ("Surlyn" A): Thermoplastic produced as a granular material; flexible, transparent, grease-resistant; very light-weight but tough. Izod impact strength 5.7-14.6 ft-lb/in (higher than any other polyolefin); tensile strength 3,500-5,500 psi; elongation 300-400%; softening point 160°F. Insoluble in any commercial solvent; subject to slow swelling by hydrocarbons, to slow attack by acids.

Uses: Coatings; packaging films; products made by injection or blow molding, or by thermoforming.

SUS. Abbreviation for Saybolt Universal seconds. See Saybolt Universal viscosity.

suspension. A system in which very small particles (solid, semisolid, or liquid) are more or less uniformly dispersed in a liquid or gaseous medium. If the particles are small enough to pass through filter membranes, the system is a colloidal suspension (or solution). Examples of solid-in-liquid suspensions are comminuted wood pulp in water, which becomes paper on filtration; the fat particles in milk; and the red corpuscles in blood. A liquid-in-gas suspension is represented by fog or by an aerosol spray. If the particles are larger than colloidal dimensions they will tend to precipitate, if heavier than the suspending medium, or to agglomerate and rise to the surface, if lighter. This can be prevented by incorporation of protective colloids. Polymerization is often carried out in suspension, the product being in the form of spheres or beads. See also solution, colloidal; dispersion; emulsion; colloid chemistry.

"Sustane."^{416,405} Trademark for a group of nontoxic formulations based on butylated hydroxyanisole.

Forms available: 3 and 6, liquid formulations; BHA, white tablets; E, water emulsifiable formulation; 1-F and 3-F, flakes.

Uses: Antioxidants for food products, especially animal fats and vegetable oils; in cooked food products such as potato chips, baked goods, nuts, etc.; stabilizer for petroleum wax coatings for food packaging; petroleum products.

Sweeten. (1) To add sugar or a synthetic product to foods or beverages to provide a sweet taste (see flavor). (2) To deodorize and purify petroleum products by removing sulfur compounds (see doctor treatment). (3) In industrial slang, to increase the quality of a low-cost product by adding more expensive ingredients.

sweetener, nonnutritive. A food additive, either natural or synthetic, usually having much greater sweetness intensity than sugar (sucrose), but without its caloric value. In some cases they act as enhancers or potentiators of sweetness. Chief among them at present is saccharin, a benzoic acid derivative. The cyclamate group was removed from the market by FDA in 1970 because of animal carcinogenicity, though the evidence in respect to human toxicity is controversial. Efforts to change this ruling have been unsuccessful.

Increasing research in the last decade has developed several new noncaloric sweeteners: the dihydrochalcone group of disaccharides; glycyrrhizin (licorice extract), especially its ammoniated derivative; and the glycoprotein "miracle fruit", indigenous to West Africa but now being cultivated in the U.S., the product to be known as miracle fruit concentrate (MFC). See also flavanone; dihydrochalcone; glycyrrhizin.

sweet oil. See olive oil.

sweet water. (1) The glycerin and water mixture obtained when fats are split (or hydrolyzed) with water to give fatty acid and glycerin. (2) The washings from char used in sugar refining. (3) In engineering terminology, plain water cooled to just above the freezing point and used to preserve milk and other food products.

sweep. Generic name for methyl 3,4-dichlorocarbamate (methyl N-3,4-dichlorophenylcarbamate)
 $\text{CH}_3\text{OOCNHC}_6\text{H}_3\text{Cl}_2$.

Properties: Crystals; m.p. 113°C. Insoluble in water and kerosene; soluble in acetone and dimethylformamide. Hazard: May be toxic.

Use: Herbicide.

"Sylfat."²⁹⁶ Trademark for high-purity tall oil fatty acids used in protective coatings, soaps, detergents, disinfectants, intermediates, and flotation chemicals.

"Sylflex."¹⁴⁹ Trademark for compositions used in the preparation of leather to impart permanent water repellence.

"Sylgard."¹⁴⁹ Trademark for a series of silicone resin encapsulants used in electronic assemblies.

"Sylkyd."¹⁴⁹ Trademark for organosiloxo compositions for use as intermediates in the production of resins and formulating varnishes, paints, and enamels.

"Sylmer."¹⁴⁹ Trademark for silicone compositions used in the finishing textile fabrics, and in the preparation and treatment of leather to impart permanent water repellence.

"Syl-off."¹⁴⁹ Trademark for a series of stick-proof silicone coatings for paper. Coatings are unaffected by melts up to 275°F.

"Sylloid."²⁴¹ Trademark for a series of micron-sized silicas. Used as flattening agents, lacquer, baking finishes, inks, paper reproduction, adhesives, pharmaceuticals, insulation.

"Sylvamix."²⁹⁶ Trademark for an internal additive for concrete masonry. A noncorrosive, nonflammable resin derivative of tall oil, developed principally to reduce water absorption, improve surface texture and inhibit efflorescence in all types of concrete masonry units and in mortar joints.

"Sylvaros."²⁹⁶ Trademark for high purity tall oil rosins used in sizing of paper and manufacture of resins for protective coatings and food containers.

"Sylvatal."²⁹⁶ Trademark for a refined tall oil.

sylvic acid. See abietic acid.

sylvite (sylvine) KCl. A natural potassium chloride. Contains about 43% potassium chloride, 57% sodium chloride, sometimes with up to 0.26% bromide.

Properties: Colorless or white, bluish or reddish in color; streak, white; vitreous luster. Resembles rock salt in appearance. Sp. gr. 1.97–1.99; Mohs hardness 2.

Occurrence: West Texas; New Mexico; Europe.

Use: Major source of potassium compounds in the United States; used for fertilizers.

symmetrical compound. A compound derived from benzene in which the hydrogen atom on three alternate carbon atoms has been replaced with another element or group, for example, at the 1, 3, and 5 positions.

symmetry. Arrangement of the constituents of a molecule in a definite and continuously repeated space pattern or coordinate system. It is described in terms of three parameters called elements of symmetry, namely: (1) The center of symmetry, around which the constituent atoms are located in an ordered arrangement; there is only one such center in a molecule, which may or may not be an atom. (2) Planes of symmetry, which represent division of a molecule into mirror-image segments. (3) Axes of symmetry, represented by lines passing through the center of symmetry; if the molecule is rotated it will have the same position in space more than once in a complete 360° turn, e.g., the benzene molecule, with six axes of symmetry, requires a 60° rotation to return to its identical position. See also stereochemistry; asymmetry.

"Symmetrel"²⁸ (amantadine hydrochloride). Trademark for a synthetic antiviral drug specific for A₂ type virus infection (one type of Asian flu). It is taken orally, and acts by preventing the virus from entering cells. It is inactive against B type viruses. Reported to be effective in treatment of Parkinson's disease.

"Sympatol" Tartrate.¹⁶² Trademark for synephrine tartrate.

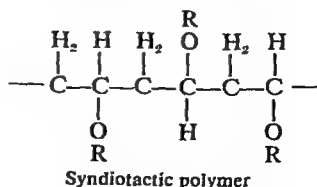

synaptase. See emulsin.

"Synasol."²¹⁴ Trademark for solvent composed of 100 gal of S.D. 1 ethanol denatured with 1 gal of methyl isobutyl ketone, 1 gal of ethyl acetate (87%), and 1 gal of aviation gasoline.

Uses: Wherever an alcohol-type solvent is required, except for anti-freeze, where its use is prohibited by the Bureau of Internal Revenue.

syndet. Abbreviated form for synthetic detergent. See detergent.

syndiotactic. A type of polymer molecule in which groups of atoms that are not part of the backbone structure are located in some symmetrical and recurring fashion above and below the atoms in the backbone chain, when the latter are arranged so as to be in a single plane. See polymer, stereospecific.

"Synektan."³⁰⁹ Trademark for a series of synthetic tanning materials.

synephrine tartrate (para-methylaminoethanolphenol tartrate; 1-(para-hydroxyphenyl)-2-methylaminoethanol tartrate)

$(\text{HOC}_6\text{H}_4\text{CHOHCH}_2\text{NHCH}_3)_2\text{C}_4\text{H}_6\text{O}_6$.

Properties: White crystals; freely soluble in water and alcohol; m.p. 182–85°C.

Use: Medicine.

syneresis. The contraction of a gel on standing, with exudation of liquid. The separation of serum from a blood clot, or of the whey in milk souring or cheese making are examples.

synergism. A chemical phenomenon (the opposite of antagonism) in which the effect of two active components of a mixture is more than additive, i.e., it is greater than the equivalent volume or concentration of either component alone. A substance that induces this result when added to another substance is called a synergist.

"Synkamin."³³⁰ Trademark for 4-amino-2-methyl-1-naphthol, as the hydrochloride, $\text{NH}_2(\text{CH}_3)\text{C}_{10}\text{H}_5\text{OH} \cdot \text{HCl}$. Used in medicine.

"Synoca."¹⁰⁸ Trademark for a group of cleaning compounds, including wetting agents, detergents or alkaline hexametaphosphate.

Containers: 100 and 300 lb. drums; 55 gal. drums.

Uses: Continuous conditioning and batch washing of paper machine felts. Paper mill system boil-outs. Deinking of secondary fiber.

"Synotol."⁵⁵⁵ Trademark for a series of alkanolamides of fatty acids. Used as foam builders, viscosity improvers, wetting agents, detergents, and opacifiers.

syntan. A synthetic organic tanning material made from phenolsulfonic acids and formaldehyde. Used for both chrome and vegetable tanned leathers. See also tanning.

synthane process. See gasification.

"Synthenol."⁶⁴ Trademark for a series of dehydrated castor oils with fast, controllable rate of bodying, excellent color retention, and water resistance.

Uses: Varnishes, enamels, house paints.

synthesis. Creation of a substance which either duplicates a natural product or is a unique material not found in nature, by means of one or more chemical reactions, or (for elements) by a nuclear change. High temperatures and pressures as well as a catalyst are usually required. Though syntheses are more readily achieved with organic compounds because of the great versatility of the carbon atom, extremely important syntheses of inorganic compounds were made in the early years of chemistry. A list of noteworthy syntheses, with approximate dates, would include the following:

<i>Inorganic</i>		<i>Organic</i>	
sulfuric acid		urea (Wohler)	1828
(chamber)	1746	mauveine (Perkin)	1857
(contact)	1890	Celluloid (Hyatt)	1869
soda ash (LeBlanc)	1800	ethylbenzene	
(Solvay)	1861	(Friedel-Crafts)	1877
ammonia		rayon	
(Haber-Bosch)	1912	(Chardonnet)	1910
plutonium	1940	phenolic resins	
		(Baekeland)	1910
		neoparsphenamine	
		(Ehrlich)	1910

aldehydes, alcohols

(Oxo synthesis) 1920

insulin (Banting) 1925

methanol 1927

neoprene

(Nieuwland) 1930

nylon (Carothers) 1935

SBR rubber 1940

polyisoprene 1950

The tremendous proliferation of synthetic materials in recent years, especially in the high-polymer field, was made possible by the increasingly sophisticated use of catalysts, particularly the Ziegler and Natta stereospecific type.

Synthesis of elements has also occurred; since 1940 all the transuranic elements from 93 to 105, as well as a vast array of radioisotopes of natural elements, have been created by nuclear bombardment of various types.

See also following entries; resin, synthetic; semisynthetic.

synthesis gas. Any of several gaseous mixtures used for synthesizing a wide range of compounds, both organic and inorganic, especially ammonia. Such mixtures result from reacting carbon-rich substances with steam (steam reforming) or steam and oxygen (partial oxidation); they contain chiefly carbon monoxide and hydrogen, plus low percentages of carbon dioxide and usually of nitrogen (less than 2.0%). The organic source materials may be natural gas, methane, naphtha, heavy petroleum oils, or coke (coal). The reactions are nickel-catalyzed steam-cracking (reforming) of methane or natural gas ($\text{CH}_4 + \text{H}_2\text{O} \rightarrow \text{CO} + 3\text{H}_2$); partial oxidation of methane, naphtha, or heavy oils; and (especially in view of the petroleum shortage) the water-gas reaction with coke ($\text{C} + \text{H}_2\text{O} \rightarrow \text{CO} + \text{H}_2$). With transition-metal catalysts synthesis gas yields alcohols, aldehydes, acrylic acid, etc., and has many useful reactions with acetylene; it is the basis of the Oxo and Fischer-Tropsch reactions. Synthesis gas from which the CO has been removed and adjusted to a ratio of 3 parts hydrogen to 1 part nitrogen is used for ammonia synthesis (nitrogen fixation). Processing with a catalyst at high temperatures and pressures yields ammonia. See also ammonia, anhydrous; Oxo process; Haber; water gas; gasification.

Note: Do not confuse with synthetic natural gas.

synthetic natural gas (SNG). Any manufactured fuel gas of approximately the same composition and Btu value as that obtained naturally from oil fields (about 85% methane and 15% ethane). There are two major methods of synthesis involving catalysts, high temperature and high pressure: (1) direct hydrogenation of coal and (2) methanation of synthesis gas (q.v.), which is obtained by hydrogenolysis of coal or steam-reforming of naphtha or similar petroleum distillate. Other methods involve pyrolysis of solid wastes and extraction from oil shale and manures. See also gasification; hydrogenolysis.

synthetic resin. See resin, synthetic.

synthine process. See Fischer-Tropsch process.

"Synthrapol."³²⁵ Trademark for a series of ethylene oxide condensation products. Used as nonionic all-purpose surface-active agents.

"Synthravon."³²⁵ Trademark for a series of nonsubstantive softeners used as textile napping assistants, lubricants, and resin-finishing plasticizers.

synton. Any of several isomers of prostaglandin from which prostaglandin analogs and intermediates may be derived.

"Synvarac."⁴⁹⁵ Trademark for a group of resinous compositions specifically designed for use in the construction of chemically resistant equipment. Principal components are graphite and a thermosetting resin.

"Synvaren."⁴⁹⁵ Trademark for phenol-formaldehyde resins in liquid form.

"Synvarex."⁴⁹⁵ Trademark for specialty resins derived from various forms of soya, linseed, fish oil, lauric, coconut, fatty acid type flat, medium and short copolymer alkyds and from PE ester of tall oil, and nonphenolic spar.

Uses: Paints and enamels.

syrosingopine $C_{35}H_{42}N_2O_{11}$. Methyl reserpate ester of syringic acid ethyl carbonate. An analog of reserpine. Properties: White or slightly yellowish powder. Practically insoluble in water; slightly soluble in methanol; soluble in chloroform and acetic acid.

Grade: N.F.

Use: Medicine.

syrup. Commercial name for an aqueous solution of cane or beet sugar (sucrose) sold in tank car lots to manufacturers of candy, soft drinks, soda-fountain goods, etc. U.S.P. grade is an aqueous solution of cane sugar (85g/100 ml). A viscous liquid with sp. gr. about 1.313.

"Systox."¹⁸¹ Trademark for demeton (q.v.).

"Syton."⁵⁸ Trademark for a series of colloidal silicas dispersed in water. Used as anti-soil and anti-slip agents.

T

T Symbol for tritium (q.v.).

2,4,5-T. Abbreviation for 2,4,5-trichlorophenoxyacetic acid.

2,4,6-T. Abbreviation for 2,4,6-trichlorophenol.

Ta Symbol for tantalum.

table salt. See sodium chloride.

tabun (dimethylphosphoramidocyanidic acid, ethyl ester) $(\text{CH}_3)_2\text{NP}(\text{O})(\text{C}_2\text{H}_5\text{O})(\text{CN})$.

Properties: Liquid, f.p. -50°C ; b.p. 240°C ; flash point 172°F ; sp. gr. 1.4250 ($20/4^\circ\text{C}$); readily soluble in organic solvents; miscible with water but readily hydrolyzed. Destroyed by bleaching powder, which, however, generates cyanogen chloride. Combustible.

Hazard: Highly toxic by inhalation; cholinesterase inhibitor. Not manufactured.

"TAC."³²⁹ Trademark for tested additive chemical items, satisfactory for food additives and medical uses.

tachysterol $\text{C}_{28}\text{H}_{48}\text{O}$. A sterol.

Properties: Oil; levorotatory; insoluble in water, soluble in most organic solvents. Protect from air.

Use: Medicine, as the dihydrotachysterol.

tackiness (tack). Property of being sticky or adhesive.

taconite. A low-grade iron ore consisting essentially of a mixture of hematite and silica. It contains about 25% iron. Found in the Lake Superior district and western states.

tacticity. The regularity or symmetry in the molecular arrangement or structure of a polymer molecule. Contrasts with random positioning of substituent groups along the polymer backbone, or random position with respect to one another of successive atoms in the backbone chain of a polymer molecule. See polymer, stereospecific; isotactic.

"Tag."²⁵³ Trademark for a type of fungicide containing phenyl mercuric acetate.

Hazard: See mercury compounds.

"Tagathen."³¹⁵ Trademark for chlorothen citrate (q.v.).

tagged atom. A radioactive isotope used in tracing the behavior of a substance in both biochemical and engineering research, e.g. carbon-14 or iodine-131. See tracer; label (2).

Tag Open Cup. See TOC.

tailings. (1) In flour-milling, the product left after grinding and bolting middlings (q.v.). (2) Impurities remaining after the extraction of useful minerals from an ore. (3) In general, any residue from a mechanical refining or separation process.

"Tajmir."⁷⁵ Trademark for a nylon-4 resin and fiber, a synthetic based on 2-pyrrolidone. It has excellent dyeability, high moisture regain, and water absorption capability exceeding that of other synthetic

fibers and equivalent to cotton. It is also antistatic and abrasion-resistant. It is used in all types of garments and clothing, as well as athletic shoes and leather substitutes.

"Takalab TLM."²¹² Trademark for a product containing diastatic and proteolytic enzymes.

Properties: Dry, fine, white powder, fully water-soluble, nonhazardous, nonflammable; optimum pH for diastatic reaction 6.5-7.0; for proteolytic reaction 7.0-8.4; optimum temperature 45°C .

Use: Digestion of albumin and starch-containing stains in commercial drycleaning plants.

"Takamine" Pectinase.²¹² Trademark for an enzyme system which hydrolyzes and depolymerizes pectins over a wide range of conditions. Used to produce clear fruit juices, wine, and jellies.

"Takatabs."²¹² Trademark for sodium *d*-erythorbate in tablet form.

"Take-Hold."¹ Trademark for a completely water-soluble mixture of ammonium and potassium phosphates giving a substantially neutral solution.

Use: Agricultural starter solution mix for transplanting set-outs.

"Takimerse."²¹² Trademark for a product containing diastatic and proteolytic enzymes.

Properties: Dry, fine white powder, water-soluble; nonhazardous, nonflammable. Optimum pH 7.0-8.0; optimum temperature $40-45^\circ\text{C}$.

Uses: Digestion of albumin and starch-containing stains by immersion, in commercial drycleaning plants.

"Talase."²¹² Trademark for a special enzyme formulation having both amylase and protease activity. Used in textile industry.

talc (talcum; mineral graphite; steatite)

$\text{Mg}_3\text{Si}_4\text{O}_{10}(\text{OH})_2$ or $3\text{MgO} \cdot 4\text{SiO}_2 \cdot \text{H}_2\text{O}$. A natural hydrous magnesium silicate. Compact massive varieties may be called steatite in distinction from the foliated varieties, which are called talc. Soapstone is an impure variety of steatite.

Properties: White, apple green, gray powder; luster pearly or greasy; feel greasy; Mohs hardness 1-1.5 (may be harder when impure). High resistance to acids, alkalis and heat. Sp. gr. 2.7-2.8.

Grades: Crude; washed; air-floated; U.S.P. fibrous (99.5%, 99.95%).

Containers: 50-lb paper bags; 200-lb multiwall bags; bulk.

Hazard: Moderate by inhalation. Tolerance, 20 million particles per cubic foot in air.

Uses: Ceramics; cosmetics and pharmaceuticals; filler in rubber, paints, soap, putty, plaster, oilcloth; adherent; dusting agent; lubricant; paper; slate pencils and crayons; electrical insulation.

See also magnesium silicate.

tall oil (tallol; liquid rosin). A mixture of rosin acids, fatty acids, and other materials obtained by acid treatment of the alkaline liquors from the digesting (pulp) of pine wood. Combustible; low toxicity. Flash point 360°F.

Derivation: The spent black liquor from the pulping process is concentrated until the sodium salts (soaps) of the various acids separate out and are skimmed off. These are acidified by sulfuric acid. Composition and properties vary widely, but average 35–40% rosin acids, 50–60% fatty acids.

Grades: Crude; refined.

Containers: Drums; tank cars; tank trucks.

Uses: Paint vehicles; source of rosin; alkyd resins; soaps, cutting oils and emulsifiers; driers; flotation agents; oil-well drilling muds; core oils; lubricants and greases; asphalt derivatives; rubber reclaiming; synthesis of cortisone and sex hormones.

tallow. An animal fat containing C_{16} to C_{18} .

Properties: The solidifying points of the different tallows are as follows; from 20–45°C for horse fat; 27–38°C for beef tallow; 54–56°C for stearin and oleo; 32–41°C for mutton tallow. Combustible; nontoxic. Sp. gr. 0.86; refractive index (40°C) 46–49 (Zeiss); iodine value 193–202; flash point 509°F. Combustible.

Derivation: Extracted from the solid fat or "suet" of cattle, sheep or horses by dry or wet rendering.

Chief constituents: Stearin, palmitin and olein.

Grades: Edible; inedible; beef tallow; mutton tallow; horse fats, acidless; edible, extra.

Containers: 50-lb tierces; 375-lb barrels; tank trucks; tank cars.

Uses: Soap stock; leather dressing; candles; greases; manufacture of stearic and oleic acids; animal feeds; adherent in tire molds.

"Talwin."¹⁶² Trademark for pentazocine (q.v.).

"Tamarax."³⁴² Trademark for extract of tamarind rind for flavoring.

"Tamax."⁴⁰⁸ Trademark for a premium grade, bonded mullite refractory available as brick and special shapes. Manufactured from calcined Indian kyanite or other high purity aluminum silicate materials. Used in the construction of glass-melting furnaces.

"Tamed Iodine."²⁸⁴ Trademark for iodophors (iodine complexed with surface-active agents that have detergent properties).

"Tamol."²³ Trademark for anionic, polymer-type dispersing agents. Supplied as light-colored powders or aqueous solutions. Effective dispersant for aqueous suspensions of insoluble dyestuffs, polymers, clays, tanning agents and pigments.

Use: Manufacture of dyestuff pastes; textile printing and dyeing; pigment dispersion in textile backings, latex paints and paper coatings; retanning and bleaching of leather; dye resist in leather dyeing; dispersion of pitch in paper manufacture; pre-floc prevention in the manufacture of synthetic rubber.

"Tamul."⁴⁰⁸ Trademark for a synthetic mullite produced by sintering selected grades of bauxite. Used in the manufacture of a wide variety of special refractory materials. Also the brand name of some of the products manufactured from "Tamul" synthetic mullite grain.

"Tanak" MRX.⁵⁷ Trademark for melamineformaldehyde resin tanning agent used to make pure white leather and for bleaching and filling chrome leather.

"Tanamer."⁵⁷ Trademark for sodium polyacrylate adhesive for use during the drying of leather. See acrylate.

"Tanarc."²⁵⁰ Trademark for a material which provides a source of titanium dioxide in welding electrode coatings. Also serves as a ceramic colorant.

"Tanasol."³⁰⁹ Trademark for a series of synthetic, organic sulfonic acid condensation products used in tanning of hides and skins.

"Tandearil."²¹⁹ Trademark for a brand of oxyphenbutazone.

tangerine oil. See citrus peel oil.

tankage (animal tankage; tankage, rough ammoniate).

The product obtained in abattoir by-product plants from meat scraps and bones, which are boiled under pressure and allowed to settle. The grease is removed from the top and the liquor drawn off. The scrap is then pressed, dried and sold for fertilizer.

Grades: Based on per cent of ammonia and bone phosphate. A medium grade has 10% ammonia and 20% bone phosphate. Concentrated tankage has had the boiled down tank liquor and press water added to it before drying, and runs about 15–17% ammonia.

Hazard: Flammable; may ignite spontaneously.

Shipping regulations: (Air) Not acceptable. (Rail) Yellow label. Not accepted by express.

tankage, garbage (tankage fertilizer). Garbage treated with steam under pressure, the water and some of the grease removed by pressing and further grease removed by solvent extraction. Contains from 3–4% ammonia, 2–5% phosphoric acid and 0.50–1.00% potash.

Hazard: Flammable; may ignite spontaneously.

Use: Fertilizer.

Shipping regulations: (Air) Not acceptable. (Rail) Yellow label. Not accepted by express.

"Tannex."²³⁶ Trademark for a full substitute for quebracho in the thinning of drilling muds. Used in mud thinning when exposed to the high bottom-hole temperatures of deep wells. May be added directly to the mud system, but gives better results when dissolved in caustic soda solution before adding to the mud system.

tannic acid (gallotannic acid; tannin) $C_{76}H_{52}O_{46}$, described as a penta-(m-digalloyl)-glucose. Natural substance widely found in nutgalls, tree barks, and other plant parts. Tannins are known to be gallic acid derivatives. A solution of tannic acid will precipitate albumin.

Tannins are classified according to their behavior on dry distillation into two groups, (1) condensed tannins, which yield catechol, and (2) hydrolyzable tannins, which yield pyrogallol. Group (2) comprises two groups on the basis of its products of hydrolysis, glucose and (a) ellagic acid or (b) gallic acid.

Properties: Lustrous, faintly yellowish, amorphous powder, glistening scales or spongy mass; darkens on exposure to air; odorless; strong astringent taste; m.p., decomposes at 210°C; soluble in water, alcohol, and acetone; almost insoluble in benzene, chloroform, ether, and petroleum ether. Combustible. Flash point 390°F, autoignition temp. 980°F.

Derivation: Extraction of powdered nutgalls with water and alcohol.

Grades: Technical; C.P.; N.F.; fluffy; F.C.C.

Containers: Barrels; drums.

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Chemicals (tannates, gallic acid, pyrogallac acid, hydrosols of the noble metals); alcohol denaturant; tanning; textiles (mordant and fixative); electroplating; galvanoplastics (gelatin precipitant); clarification agent in wine manufacture, brewing and foods; writing inks; pharmaceuticals; deodorization of crude oil; photography; paper (sizing, mordant for colored papers); treatment of minor burns.

tanning. The preservation of hides or skins by use of a chemical, which (1) makes them immune to bacterial attack, (2) raises the shrinkage temperature, and (3) prevents the collagen fibers from sticking together on drying, so that the material remains porous, soft, and flexible. Vegetable tanning is used mostly for sole and heavy-duty leathers. The chief vegetable tannins are water extracts of special types of wood or bark, especially quebracho (q.v.) and wattle (q.v.). The main active constituent is tannic acid (q.v.). The tannins penetrate the skin or hide after long periods of soaking, during which the molecular aggregates of the tannin form cross-links between the polypeptide chains of the skin proteins; hydrogen bonding is an important factor.

In mineral or chrome tanning, the sulfates of chromium, aluminum and zirconium are used (the last two for white leather); here the reaction is of a coordination nature between the carboxyl groups of the skin collagen and the metal atom. Syntans are also used; these are sulfonated phenol or naphthol condensed with formaldehyde. Condensation products other than phenol having strong hydrogen-bonding power have been developed. Tanning by any method is a time-consuming and exacting process, requiring careful control of pH, temperature, humidity, and concentration factors. See also leather. For further information refer to Tanners' Council, University of Cincinnati, Cincinnati, Ohio.

tannyl acetate. See acetyltannic acid.

"Tanolin."⁵⁸² Trademark for basic chromium sulfate. **Uses:** Chrome tanning of leather; colors; compounding.

"Tansul 7" Clay.²³⁶ Trademark for beneficiated magnesium montmorillonite. Used as a flocculating agent and selective absorbent primarily in the beverage industry.

"Tansul" Enzyme.²³⁶ Trademark for a mixture of plant-derived proteolytic enzymes in white powder form or clear liquid form with a hydrolysis potency of 60-75 Activity Units/gram. Used as a protein hydrolyzing agent in beverages.

tantalac acid anhydride. See tantalum oxide.

tantalac chloride. See tantalum chloride.

tantalite (Fe, Mn) (TaCb)₂O₆. The most important ore of tantalum, found in Canada, Africa, Brazil, Malaysia. When Cb content exceeds that of Ta, the ore is called columbite.

tantalum Ta Element of atomic number 73 in group VB of the periodic system. Atomic weight 180.9479; valences 2, 3, 5. No stable isotopes.

Properties: (a) Black powder. (b) Steel-blue-colored metal when unpolished; nearly a platinum-white color when polished. Soluble in fused alkalis; insoluble in acids except hydrofluoric and fuming sulfuric acids. Sp. gr. (a) 14.491; (b) 16.6 (worked metal);

m.p. 2996°C; b.p. 5425 ± 100°C. Tensile strength of drawn wire may be as high as 130,000 psi. Refractive index 2.05. Expansion coefficient 8×10^{-6} over range 20-1500°C. Electrical resistance 13.6 microhm-cm (0°C), 32.0 (500°C).

Derivation: From tantalum potassium fluoride, by heating in an electric furnace, by sodium reduction, or by fused salt electrolysis. The powdered metal is converted to a massive metal by sintering in a vacuum. Foot-long crystals can be grown by arc-fusion.

Corrosion resistance: 99.5% pure tantalum is resistant to all concentrations of hot and cold sulfuric (except concentrated boiling), hydrochloric, nitric and acetic acids, hot and cold dilute sodium hydroxide, all dilutions of hot and cold ammonium hydroxide, mine and sea waters, moist sulfurous atmospheres, aqueous solutions of chlorine.

Forms and grades available: Powder 99.6% pure; sheet; rods; wire; ultrapure; single crystals.

Hazard: Dust or powder may be flammable. Moderately toxic by inhalation. Tolerance, 5 mg per cubic meter of air.

Uses: Capacitors; chemical equipment; dental and surgical instruments; rectifiers; vacuum tubes; furnace components; high-speed tools; catalyst; getter alloys; sutures and body implants; electronic circuitry; thin-film components.

tantalum alcoholate (pentaethoxytantalum) (C₂H₅O)₅Ta. **Uses:** Catalyst; intermediate for pure tantalates; preparing thin dielectric films.

tantalum carbide TaC. Hard, heavy, refractory crystalline solid; m.p. 3875°C; b.p. 5500°C; sp. gr. 14.5; hardness 1800 kg/sq mm; resistivity 30 microhm cm (room temp); extremely resistant to chemical action except at elevated temperatures.

Derivation: Tantalum oxide and carbon heated at high temperatures.

Uses: Cutting tools and dies; cemented carbide tools.

tantalum chloride (tantalac chloride; tantalum pentachloride) TaCl₅.

Properties: Pale yellow, crystalline powder. Highly reactive. Decomposed by moist air. Keep well stoppered! Sp. gr. 3.7; b.p. 242°C; m.p. 221°C. Soluble in alcohol and potassium hydroxide.

Grade: Technical.

Uses: Chlorination of organic substances; intermediate; production of pure metal.

tantalum disulfide TaS₂. Black powder or crystals; m.p. above 3000°C; insoluble in water. Available in 40 micron size. Used as a solid lubricant.

tantalum nitride TaN.

Properties: Hexagonal brown, bronze or black crystals; sp. gr. 16.3; m.p. 3310-3410°C; insoluble in water; slightly soluble in aqua regia, nitric acid, hydrofluoric acid.

Grade: Technical; powder.

tantalum oxide (tantalac acid anhydride; tantalum pentoxide) Ta₂O₅.

Properties: Rhombic, crystalline prisms; sp. gr. 7.6; m.p. 1800°C; insoluble in water and acids except hydrofluoric.

Derivation: From tantalite, by removal of other metals. **Grades:** Technical; optical (99.995% pure); single crystals.

Uses: Production of tantalum; "rare-element" optical glass; intermediate in preparation of tantalum car-

bide; piezoelectric, maser and laser applications; dielectric layers in electronic circuits.

tantalum pentachloride. See tantalum chloride.

tantalum pentoxide. See tantalum oxide.

tantalum potassium fluoride (potassium tantalum fluoride; potassium fluotantalate; K_2TaF_7).

Properties: White, silky needles. Slightly soluble in cold water, quite soluble in hot water.

Hazard: Toxic by inhalation. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Intermediate in preparation of pure tantalum.

tantiron. A ferrous alloy containing 84.87% iron, 13.5% silicon, 1% carbon, 0.4% manganese, 0.18% phosphorus, 0.05% sulfur. It is resistant to acids; used for chemical equipment.

"Tanz."⁴⁸ Trademark for an ammonium lignin sulfonate used as an extender for vegetable tannin extracts.

"Tapazole."¹⁰⁰ Trademark for methimazole, U.S.P.

tapioca. A product rich in starch, obtained from the tuberous roots of the cassava plant. It is used both directly as a food and as a thickening agent in emulsions for food-products and industrial applications (lithographic inks). In many uses it is a satisfactory substitute for gum arabic.

TAPPI. Abbreviation for Technical Association of the Pulp and Paper Industry (q.v.).

tar. See coal tar; cigarette tar; pine tar; tar, wood.

tar acid. Any mixture of phenols present in tars or tar distillates and extractable by caustic soda solutions. Usually refers to tar acids from coal tar and includes phenol, cresols, and xylenols. When applied to the products from other tars it should be qualified by the appropriate prefix, e.g., wood-tar acid, lignite tar acid, etc.

Properties: Soluble in alcohol and coal-tar hydrocarbons. Combustible.

Grades: 15-18%, 25-28% and 50-53% phenol.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Strong irritant to tissue.

Uses: Wood preservative; insecticide for cattle and sheep dipping, (dip oils or sheep dip); manufacture of disinfectants.

tar base. A basic nitrogen compound derived from coal tar, such as pyridine, picoline, lutidine, and quinoline.

tar camphor. See naphthalene.

tar camphor, chlorinated. See chloronaphthalene.

"Tar-Cel."²³⁵ Trademark for 72% "Dry Liquid" concentrate of "Tarene," a pine tar type plasticizer.

Properties: Light brown, free-flowing powder; sp. gr. 1.41.

Uses: Plasticizer and softener for plastics and rubber.

tar, dehydrated (tar, refined).

Properties: Dark brown, thick, viscid liquid; combustible.

Derivation: Tar from which the water has been driven off.

Grade: Technical.

Containers: Barrels; tank cars.

Hazard: Toxic; strong irritant; absorbed by skin.

Uses: Water-proofing compounds; roads; medicine.

"Tarene."²³⁵ Trademark for mixed naval stores (pine tar type).

Properties: Non-toxic, dark brown viscous liquid; sp. gr. 0.99-1.02; ash 0.5%, benzene-soluble. Combustible.

Uses: Plasticizer and softener.

tarnish. A reaction product that occurs readily at room temperature between metallic silver and sulfur in any form. The well-known black film that appears on silverware results from reaction between atmospheric sulfur dioxide and metallic silver, forming silver sulfide. It is easily removable with a cleaning compound and is not a true form of corrosion. Plating with a mixture of silver and indium will increase tarnish resistance. Gold will also tarnish in the presence of a high concentration of sulfur in the environment.

tar oil. See creosote, coal-tar.

tar-oil, wood (pine-tar oil).

Properties: Almost colorless liquid when freshly distilled; turns dark reddish-brown; strong odor and taste. Sp. gr. 0.862-0.872. Soluble in ether, chloroform, alcohol and carbon disulfide. Flash point 144°F (closed cup). Combustible. Low toxicity.

Derivation: Obtained by the destructive distillation of the wood of *Pinus palustris*.

Method of purification: Rectification.

Grades: Technical; rectified; refined.

Containers: Drums; glass bottles; tank cars.

Uses: Paints; waterproofing paper; rubber reclaiming; varnishes; stains; ore flotation; cattle dips; insecticides.

"Tarpine."⁷⁹ Trademark for a pine tar used as a tackifier in rubber compounding and in rubber reclaiming.

tarragon oil. See estragon oil.

tar, refined. See tar, dehydrated.

tar sands. See oil sands.

"Tartan."¹⁵⁸ Trademark for a synthetic turf or surfacing material for athletic fields. Composed of specially compounded synthetic resins on asphalt base.

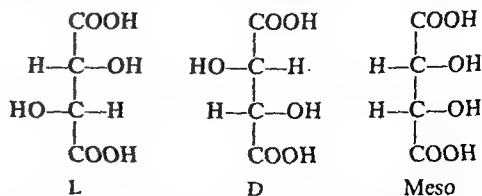

tartar, cream of. See potassium bitartrate.

tartar emetic. See antimony potassium tartrate.

tartaric acid (dihydroxysuccinic acid).

Properties: Colorless, transparent crystals or white crystalline powder; odorless; acidic taste; stable in air. Soluble in water, alcohol, and ether. Sp. gr. 1.76; m.p. 170°C. Nontoxic. It has unusual optical properties. The molecule has two asymmetric carbons which result in three isomeric forms; the natural *D*-form and the corresponding *L*-form, which are optically active, as well as the inactive or meso form, as shown:

The occurrence of some DL-tartaric acid along with natural *D*-tartaric acid in the wine industry is explained on the basis of partial racemization.

Derivation: Occurs naturally in wine lees; made synthetically from maleic anhydride and hydrogen peroxide. A new process involving enzymatic reaction with a succinic acid derivative has been developed.

Grades: Technical; C.P.; crystalline; powder; granular; N.F.; F.C.C

Containers: Bags; drums; carlots.

Uses: Chemicals (cream of tartar, tartar emetic, acetaldehyde); sequestrant; tanning; effervescent beverages; baking powder; fruit esters; ceramics; galvanoplastics; photography (printing and developing; light-sensitive iron salts); textile industry; silvering mirrors; coloring metals.

tartrazine (FD & C Yellow No. 5) $C_{16}H_9N_4O_9S_2$. 3-Carboxy-5-hydroxy-1-para-sulphophenyl-4-para-sulphophenylazopyrazole trisodium salt. C.I. No. 19140. **Properties:** Bright orange-yellow powder. Soluble in water.

Use: Dye, especially for foods, drugs, and cosmetics.

tar, wood (tar, hardwood).

Properties: Black, syrup-like, viscous fluid.

Derivation: A byproduct of the destructive distillation of wood.

Grades: Technical.

Containers: Tank cars.

Hazard: Flammable, moderate fire risk.

Use: Hardwood pitch; wood creosote; heavy, high-boiling wood oils; wood preserving oils; paint thinners.

"Tasil."⁴⁰⁸ Trademark for a refractory brick, usually manufactured of calcined Indian kyanite; used in the construction of glass and metallurgical furnaces.

taurine (2-aminoethanesulfonic acid)
 $NH_2CH_2CH_2SO_3H$. A crystallizable amino acid found in combination with bile acids; its combination with cholic acid is called taurocholic acid.

Properties: Solid; decomposes $300^\circ C$; soluble in water; insoluble in alcohol.

Derivation: Isolated from ox bile; organic synthesis.

Uses: Biochemical research; pharmaceuticals; organic synthesis; wetting agents.

taurocholic acid (cholaic acid; cholytaurine)
 $C_{26}H_{45}NO_7S$. Occurs as sodium salt in bile. It is formed by the combination of the sulfur-containing amino acid, taurine, and cholic acid (q.v.) as the sodium salt. It aids in digestion and absorption of fats.

Properties: Crystals; stable in air. M.p. $125^\circ C$ (dec). Freely soluble in water; soluble in alcohol; almost insoluble in ether and ethyl acetate.

Derivation: Isolation from bile.

Uses: Biochemical research; emulsifying agent in foods (not over 0.1%).

tautomerism. A type of isomerism in which migration of a hydrogen atom results in two or more structures, called tautomers. The two tautomers are in equilibrium. For example, acetoacetic ester has the properties of both an unsaturated alcohol and a ketone. The tautomers are called enol and keto. See also enol; isomer (1).

"Taycor."⁴⁰⁸ Trademark for a group of corundum base refractory products. Manufactured of high purity alumina which has been sintered to form tabular corundum.

Tb Symbol for terbium.

TBH. Abbreviation for technical benzene hexachloride. See 1,2,3,4,5,6-hexachlorocyclohexane. Used as an insecticide.

TBP. Abbreviation for tributyl phosphate (q.v.).

TBT. Abbreviation for tetrabutyl titanate (q.v.).

TBTO. Abbreviation for bis(tributyltin oxide) (q.v.).

Tc Symbol for technetium.

TC. Abbreviation for trichloroacetic acid (q.v.) or its sodium salt.

TCA cycle (tricarboxylic acid cycle; Krebs cycle; citric acid cycle). A series of enzymatic reactions occurring in living cells of aerobic organisms, the net result of which is the conversion of pyruvic acid, formed by anaerobic metabolism of carbohydrates, into carbon dioxide and water. The metabolic intermediates are degraded by a combination of decarboxylation and dehydrogenation. It is the major terminal pathway of oxidation in animal, bacterial, and plant cells. Recent research indicates that the TCA cycle may have predated life on earth and may have provided the pathway for formation of amino acids.

TCB. Abbreviation for tetracarboxybutane (q.v.).

TCC. Abbreviation for Tagliabue Closed Cup, a standard method of determining flash points.

TCDD. See dioxin.

TCP. Abbreviation for tricresyl phosphate (q.v.).

TDE. Generic name for 1,1-dichloro-2,2-bis(para-chlorophenyl)ethane. (tetrachlorodiphenylethane; DDD) $(ClC_6H_4)_2CHCHCl_2$.

Properties: Colorless crystals; m.p. $109-110^\circ C$; soluble in organic solvents; insoluble in water; not compatible with alkalis. Combustible.

Derivation: Chlorination of ethanol and condensation with chlorobenzene.

Grade: Technical.

Containers: Fiber drums.

Hazard: Toxic by ingestion, inhalation and skin absorption. Use restricted in some states.

Uses: Similar to DDT; as dusts, emulsions and wettable powders for contact control of leaf rollers and other insects.

TDI. Abbreviation for toluene diisocyanate (q.v.).

TDQP. Abbreviation for trimethyldihydroquinoline polymer (q.v.).

Te Symbol for tellurium.

TEA. (1) Abbreviation for triethanolamine. (2) Abbreviation for triethylaluminum.

TEAC. Abbreviation for tetraethylammonium chloride (q.v.).

technetium Tc Element with atomic number 43 of group VIIB of the periodic system. Atomic weight 98.9062; valences 4, 5, 6, 7; 3 radioactive isotopes of half-life more than 105 years; also several of relatively short half-life, some of which are gamma emitters. Technetium was first obtained by the deuteron bombardment of molybdenum, but since has been found in the fission products of uranium and plutonium.

The chemistry of technetium has been studied by tracer techniques and is similar to that of rhenium and manganese. The free metal is obtained from reactor fission products by solvent extraction followed by crystallization as ammonium pertechnetate, which is reduced with hydrogen. The metal is silver gray in appearance, and melts at $2200^\circ C$ ($4000^\circ F$); sp. gr. ca. 11.5. It is slightly magnetic. Compounds of the types

TcO₂, Tc₂O₇, NH₄TcO₄, etc. have been prepared. The pertechnetate ion has strong anticorrosive properties. Technetium and its alloys are superconductors and can be used to create high-strength magnetic fields at low temperature.

Uses: Metallurgical tracer; cryochemistry; corrosion resistance; medicine (radiology).

Technical Association of the Pulp and Paper Industry (TAPPI). A professional group of scientists devoted to the interests of pulp and paper chemistry and technology. Founded in 1915, it has seven sections, each concerned with a specific phase of the industry. It also has eleven local sections which hold monthly meetings. The Association publishes its own journal, as well as industry data sheets, bibliographies, technical monographs on subjects relating to the paper industry, etc. Its headquarters is at 155 E. 44th Street, New York, 10017.

"Technoscents."¹⁸⁸ Trademark for odor modifiers designed to cover a disagreeable odor associated with solvents, cutting oils, paints, lubricating oils, detergents, scrub soaps and powders, fuel oils.

"Tecnangam."²⁵⁶ Trademark for free-flowing granular solid containing 75–78% manganese sulfate. Used in fertilizers and feeds.

"Tecquinol."²⁵⁶ Trademark for technical hydroquinone (98.5% min).

"Tecsol."²⁵⁶ Trademark for solvents consisting of denatured anhydrous and denatured 95% ethyl alcohol.

"Tedlar."²⁸ Trademark for polyvinylfluoride film.

TEDP. Abbreviation for tetraethyl dithionopyrophosphate (q.v.).

"Teepol" 610.¹²⁵ Trademark for a detergent and wetting agent in liquid form based on the sodium salt of secondary alkyl sulfates, of the type R₁R₂CHOSO₂ONa, where R₁ is a large alkyl group and R₂ is a relatively small alkyl group.

"Teflon."²⁸ Trademark for tetrafluoroethylene (TFE) fluorocarbon polymers available as molding and extrusion powders, aqueous dispersion, film, finishes, and multifilament yarn or fiber. The name also applies to fluorinated ethylene-propylene (FEP) resins (q.v.) available in the same forms. The no-stick cookware finishes may be of either type. Fibers are monofilaments made from copolymer of TFE and FEP.

Uses: Packing; bearings; filters; electrical insulation; high-temperature industrial plastics; cooking utensils; plumbing sealants.

See also fluorocarbon polymer.

TEG. Abbreviation for tetraethylene glycol and triethylene glycol.

"Tego."²³ Trademark for thin tissue impregnated with heat-convertible phenol-formaldehyde resin, supplied in rolls. Produces waterproof bond with plywood veneers.

Use: Hot-press bonding of furniture veneers; premium wall panelling.

TEL. Abbreviation for tetraethyl lead (q.v.).

"Teldrin."⁷¹ Trademark for chlorpheniramine maleate (q.v.).

"Telepaque."¹⁶² Trademark for iopanoic acid.

"Telloy."⁶⁹ Trademark for finely ground tellurium. Used as a secondary vulcanizing agent for rubber.

"Tellurac."⁶⁹ Trademark for tellurium diethyldithiocarbamate [(C₂H₅)₂NC(S)S]₂Te.

Properties: Orange-yellow powder; sp. gr. 1.44 ± .03; melting range 108–118°C; soluble in benzene, carbon disulfide, chloroform; slightly soluble in alcohol, gasoline; insoluble in water.

Uses: Primary or secondary (with thiazoles) rubber accelerator.

telluric acid (hydrogen tellurate) H₂TeO₄ · 2H₂O, or H₆TeO₆.

Properties: White heavy crystals. Soluble in hot water and alkalies; slightly soluble in cold water. Sp. gr. 3.07; m.p. 136°C.

Derivation: Action of sulfuric acid on barium tellurate.

Hazard: Toxic by ingestion.

Uses: Chemical reagent.

telluric bromide. See tellurium tetrabromide.

tellurium Te A nonmetallic element with many properties similar to selenium and sulfur. Atomic number 52; Group VIA of the periodic system. Atomic weight 127.60; valences 2, 4, 6. Eight stable isotopes. Low toxicity.

Properties: Silvery white, lustrous solid with metal characteristics. Density 6.24 g/cc (30°C); Mohs hardness 2.3; m.p. 450°C; b.p. 990°C. Soluble in sulfuric acid, nitric acid, potassium hydroxide and potassium cyanide solution; insoluble in water. Imparts garlic-like odor to breath; can be depilatory. It is a p-type semiconductor and its conductivity is sensitive to light exposure.

Source: From anode slime produced in the electrolytic refining of copper and lead.

Derivation: Reduction of telluric oxide with sulfur dioxide; by dissolving the oxide in a caustic soda solution and plating out the metal.

Grades: Powder, sticks, slabs and tablets, 99.5% pure; crystals, up to 99.999% pure.

Uses: Alloys (tellurium lead, stainless steel, iron castings); secondary rubber vulcanizing agent; manufacture of iron and stainless steel castings; coloring agent in glass and ceramics; thermoelectric devices; catalysts; with lithium, in storage batteries for space craft.

For further information refer to Selenium-Tellurium Development Assoc., 11 Broadway, New York.

tellurium bromide. See tellurium dibromide and tellurium tetrabromide.

tellurium chloride. See tellurium dichloride.

tellurium dibromide (tellurium bromide; tellurous bromide) TeBr₂.

Properties: Blackish green, crystalline mass, or gray to black needles. Very hygroscopic. Decomposed by water. Soluble in ether. Violet vapor. M.p. 210°C; b.p. 339°C.

tellurium dichloride (tellurium chloride; tellurous chloride) TeCl₂.

Properties: Amorphous, black mass. Greenish yellow when powdered. Decomposed by water. Sp. gr. 6.9; b.p. 327°C; m.p. 209°C.

tellurium diethyldithiocarbamate. See "Tellurac."

tellurium dioxide (tellurous acid anhydride) TeO₂.

Properties: Heavy, white, crystalline powder, odorless. Soluble in acids (conc.), alkalies; slightly soluble in acids (dilute), water. Sp. gr. 5.89; m.p. 733°C; b.p. 1245°C.

Hazard: Ingestion causes persistent garlic breath.

tellurium disulfide (tellurium sulfide) TeS_2 .

Properties: Red powder. Turns in time to a dark brown, amorphous powder. Fuses to gray, lustrous mass. Soluble in alkali sulfides; insoluble in acids, water.

tellurium lead. See lead, tellurium.

tellurium sulfide. See tellurium disulfide.

tellurium tetrabromide (telluric bromide; tellurium bromide) TeBr_4 .

Properties: Yellow crystals. Soluble in a little water (decomposes in excess water). Sp. gr. 4.3; m.p. 363°C ; b.p. approx 420°C , with decomposition into bromine and dibromide.

tellurous acid H_2TeO_3 .

Properties: White, crystalline powder. Soluble in acids (dilute), alkalies; slightly soluble in water, alcohol. Sp. gr. 3.053; m.p. 40°C (decomposes).

tellurous acid anhydride. See tellurium dioxide.

tellurous bromide. See tellurium dibromide.

tellurous chloride. See tellurium dichloride.

"Telone."²³³ Trademark for fumigants containing 1,3-dichloropropene and related C_3 hydrocarbons.

"Tel-Tale."²⁴¹ Trademark for silica gel which is impregnated with cobalt chloride and turns from blue to pink as the relative humidity increases.

"Telvar."²⁸ Trademark for wettable powder containing 80% monuron, for weed control.

Containers: 4-lb bags; 50-lb fiber drums and bags. "Telvar ML" is a stable liquid suspension containing 28% monuron, used for pre-emergence weed control in cotton.

Containers: $\frac{1}{2}$ -gal cans.

TEM. Abbreviation for triethylene melamine (q.v.).

"Temasept."⁴³⁰ Trademark for series of antimicrobial agents.

"Temasept I." 1:1 mixture of 4',5-dibromosalicylanilide and 3,4',5-tribromosalicylanilide. Used in fabric treatment and other sanitizing applications.

"Temasept II." Essentially pure 3,4',5-tribromosalicylanilide; used in deodorants, antibacterial toilet soaps, and other skin contact applications.

"Temex" 15.³⁰⁴ Trademark for a barium-cadmium organic vinyl stabilizer. A fine white powder with a sp. gr. of 1.3. Good dispersion characteristics.

Uses: Vinyl phonograph record and other rigid stocks, based on vinyl copolymer resins.

temper. To increase the hardness and strength of a metal by quenching or heat treatment.

temperature. The thermal state of a body considered with reference to its ability to communicate heat to other bodies (J. C. Maxwell). There is a distinction between temperature and heat, as is evidenced by Helmholtz' definition of heat as "energy that is transferred from one body to another by a thermal process," where by a thermal process is meant radiation, conduction, and/or convection.

Temperature is measured by such instruments as thermometers, pyrometers, thermocouples, etc.; and by scales such as centigrade (Celsius), Fahrenheit, Réaumur, and absolute (Kelvin). See also absolute temperature.

tenacity. Strength per unit weight of a fiber or filament, expressed as grams per denier. It is the rupture load

divided by the linear density of the fiber. See also tensile strength; denier.

"Tenamene."²⁵⁶ Trademark for a group of additives for gasoline and other petroleum products.

"Ten-Cem."⁴⁸⁰ Trademark for a group of neodecanoates of cobalt, copper, calcium, lead, manganese and zinc. Uses: Driers for printing inks; activators for protective coatings and plastics.

tenderization. (1) Treatment of meats with ultraviolet radiation or with certain enzyme preparations to accelerate softening of the collagen fibers and thus reduce the time necessary to "hang" the meat. (2) The degradation and mechanical weakening undergone by textile fibers under excessive wet abrasion during laundering.

"Tenex."⁷⁹ Trademark for an extremely pale heat-treated wood rosin.

Uses: Adhesive tape; artificial Burgundy pitch; core oil; cosmetics; disinfectants; electric insulating compounds; emulsions; ester gum; printing ink; rubber cement; shellac diluent; solder; spirit varnishes; synthetic resins; varnishes; Venice turpentine.

"Tenite."²⁵⁶ Trademark for cellulose esters and polyolefin thermoplastics. "Tenite" acetate, "Tenite" butyrate, "Tenite" propionate are made from cellulose acetate, cellulose acetate butyrate, and cellulose acetate propionate respectively. "Tenite" polyethylene and "Tenite" polypropylene are made by the polymerization of ethylene and propylene. "Tenite" polyallomer (q.v.) is a block copolymer of propylene and ethylene; the lightest solid plastic offered commercially. Available in formulations meeting FDA requirements for use in contact with food.

"Tenlo" 70.³⁰⁹ Trademark for a blend of fatty amides and polyethylene glycol ester. Used as a pigment grinding oil.

"Tenox."²⁵⁶ Trademark for food grade antioxidants containing one or more of the following ingredients; butylated hydroxyanisole; butylated hydroxytoluene and/or propyl gallate with or without citric acid. Some formulas are supplied in solvents such as propylene glycol.

"Teox 120."⁸⁴ Trademark for a nonionic surface-active agent composed of polyethenoxy tellate.

Properties: Light straw-colored liquid; bland odor; sp. gr. 1.065-1.070 (77°F); refractive index 1.4762 (77°F); viscosity 190 cp (77°F); heat-stable to 644°F ; very slightly hygroscopic; pH (0.2% soln) 7.2; soluble in water, acetone, benzene, ethyl ether, carbon tetrachloride, ethanol, methanol, and xylene.

Containers: 450-lb drums; tank trucks; tank cars.

Uses: Detergents; surface cleaners; textile cleaning and dyeing; emulsion formulations.

tensile strength. The rupture strength (stress-strain product at break) per unit area of a material subjected to a specified dynamic load; it is usually expressed in pounds per square inch (psi). This definition applies to elastomeric materials as well as to certain metals. For strength of textile fibers, see tenacity.

tepa. Generic name for tris(1-aziridinyl)phosphine oxide,

$(\text{CH}_2\text{CH}_2\text{N})_3\text{POH}$. See triethylenephosphoramidate.

Hazard: Highly toxic; strong irritant to skin and tissue. Use: Insect chemosterilant.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Legal label name for tris(1-aziridinyl)phosphine oxide.

"Tepidone."²⁸ Trademark for a water solution of sodium dibutylidithiocarbamate, $(C_4H_9)_2NC(S)SNa$. An amber liquid; sp. gr. 1.08.

Use: To accelerate vulcanization of natural and synthetic rubber and latex compounds.

tepp. Generic name for ethyl pyrophosphate (tetraethyl pyrophosphate) $(C_2H_5)_4P_2O_7$.

Properties: Water-white to amber liquid depending on purity; hygroscopic; miscible in all proportions with water and all organic solvents except aliphatic hydrocarbons; hydrolyzed in water with formation of mono-, di and triethyl ortho-phosphates; water solutions attack metals. Commercial material contains 40% tepp; sp. gr. approx 1.20; refractive index 1.420; b.p. (pure compound) 135–138°C (1 mm).

Derivation: From phosphorus oxychloride and ethanol or phosphorus oxychloride and triethyl phosphate.

Grade: 40%.

Containers: 5-gal cans; 50- and 55-gal drums.

Hazard: Highly toxic by skin contact, inhalation or ingestion. Rapidly absorbed through skin. Repeated exposure may, without symptoms, be increasingly hazardous. Tolerance, 0.05 mg per cubic meter of air. Use may be restricted.

Uses: Insecticides for aphids and mites, rodenticide.

Shipping regulations: (Rail, Air) Poison label. Not acceptable on passenger planes. Legal label name: tetraethyl pyrophosphate. Consult regulations for details.

tera-. Prefix meaning 10^{12} units (symbol T). 1 Tg = 1 teragram = 10^{12} grams.

"Terbec."²³³ Trademark for a wet strength improver for soils; based on 4-tert-butylcatechol.

terbia. See terbium oxide.

terbium Tb Atomic number 65; Group IIIB of the periodic table; a rare-earth element of the yttrium subgroup (lanthanide series). Atomic weight 158.9254. Valences 3, 4. No stable isotopes.

Properties: Metallic luster. Reacts slowly with water, and is soluble in dilute acids. Sp. gr. 8.332; m.p. 1356°C; b.p. 2800°C; salts colorless. Highly reactive; handled in inert atmosphere or vacuum.

Source: See rare-earth.

Derivation: Reduction of fluoride with calcium.

Grades: Regular; 99.9+% purity (ingots, lumps); single crystals.

Uses: Phosphor activator; dope for solid state devices.

terbium chloride $TbCl_3 \cdot 6H_2O$.

Properties: Transparent, colorless, prismatic crystals; readily soluble in water or alcohol; sp. gr. 4.35; m.p. (anhydrous) 588°C; very hygroscopic.

Derivation: By treatment of carbonate or oxide with hydrochloric acid in an atmosphere of dry hydrogen chloride.

terbium fluoride $TbF_3 \cdot 2H_2O$.

Properties: Solid; m.p. 1172°C; b.p. 2280°C; insoluble in water.

Hazard: Toxic; strong irritant.

Use: Source of terbium.

terbium nitrate $Tb(NO_3)_3 \cdot 6H_2O$.

Properties: Colorless monoclinic needles or white powder, soluble in water; m.p. 89.3°C.

Derivation: By treatment of oxide, carbonate or hydroxide with nitric acid.

Hazard: Strong oxidant. Fire risk in contact with organic materials.

Shipping regulations: (Rail) Nitrates, n.o.s. Yellow label. (Air) Oxidizer label.

terbium oxide (terbia) Tb_2O_3 .

Properties: Dark brown powder; soluble in dilute acids; slightly hygroscopic; absorbs carbon dioxide from air. Derivation: By ignition of hydroxides or salts of oxyacids.

Grades: 98–99%.

Containers: Glass bottles.

See also rare earth.

terbium sulfate $Tb_2(SO_4)_3 \cdot 8H_2O$.

Properties: Colorless crystals which lose $8H_2O$ at 360°C. Soluble in water.

terebene. A mixture of terpenes, chiefly dipentene and terpinene.

Properties: Colorless liquid; sp. gr. 0.862–0.866; optical rotation, inactive; b.p. 160–172°C. Soluble in alcohol; insoluble in water.

Derivation: From oil of turpentine.

Hazard: Flammable, moderate fire risk. Moderately toxic by ingestion and inhalation.

Use: Medicine.

terephthalic acid (para-phthalic acid; TPA; benzene-para-dicarboxylic acid) $C_6H_4(COOH)_2$.

Properties: White crystals or powder; insoluble in water, chloroform, ether, acetic acid; slightly soluble in alcohol; soluble in alkalies. Sp. gr. 1.51; sublimes above 300°C. Low toxicity. Combustible.

Derivation: (1) Oxidation of para-xylene or of mixed xylenes and other alkyl aromatics (phthalic anhydride). (2) reacting benzene and potassium carbonate over a cadmium catalyst.

Grades: Commercial; fiber.

Containers: Up to car and truck loads.

Uses: Production of linear, crystalline polyester resins, fibers and films by combination with glycols. Also used as a reagent for alkali in wool; additive to poultry feeds.

2-terephthaloylbenzoic acid

$HOOC-C_6H_4-CO-C_6H_4-COOH$.

Properties: White to gray powder; m.p. 233–237°C.

Use: Chemical intermediate.

terephthaloyl chloride $C_6H_4(COCl)_2$. 1,4-Benzenedicarbonyl chloride.

Properties: Colorless needles; m.p. 82–84°C; b.p. 259°C; decomposes in water and alcohol; soluble in ether. Flash point 356°F; combustible.

Hazard: Skin irritant.

Uses: Dye manufacture; synthetic fibers, resins, films; ultraviolet absorption; pharmaceuticals; rubber chemicals; cross-linking agent for polyurethanes and polysulfides.

"Tergitol."²¹⁴ Trademark for a series of nonionic and anionic surfactants.

Uses: Detergents, wetting agents, emulsifiers in water systems; leveling and spreading agents.

"Ternalloy."⁴⁵³ Trademark for a series of four aluminum-zinc-magnesium alloys. Ternalloys 5 and 6 are of self-aging, while Ternalloys 7 and 8 are amenable to heat treatment. Nominal compositions are 0.5% Mn, 0.3% Cr, and 3.0–4.8% Zn, 1.6–2.3% Mg, dependent on particular alloy. Alloys have good corrosion resistance and excellent machinability in both sand and permanent mold type castings. Supplied in ingot form.

ternary. Descriptive of a solution or alloy having three components, or of a chemical compound having three constituent elements or groups.

terneplate (roofing tin). A lead-tin alloy used for coating iron or steel; its composition is approximately 75% lead and 25% tin. It has a dull finish. Used chiefly for roofing; also for deep stamping, gasoline tanks, etc.

1,4(8)-terpadiene. See terpinolene.

terpene. An unsaturated hydrocarbon having the formula $C_{10}H_{16}$, occurring in most essential oils and oleoresins of plants. The terpenes are based on the isoprene unit C_5H_8 , and may be either acyclic or cyclic with one or more benzenoid groups. They are classified as monocyclic (dipentene), dicyclic (pinene), or acyclic (myrcene), according to the molecular structure. Many terpenes exhibit optical activity. Terpene derivatives (camphor, menthol, terpineol, borneol, geraniol, etc.) are called terpenoids; many are alcohols. See also polyterpene resin.

terpeneless oil. An essential oil from which the terpene components have been removed by extraction and fractionation, either alone or in combination. The optical activity of the oil is thus reduced. The terpeneless grades are much more highly concentrated than the original oil (from 15 to 30 times). Removal of terpenes is necessary to inhibit spoilage, particularly of oils derived from citrus sources; on atmospheric oxidation the specific terpenes form compounds that impair the value of the oil; for example, *d*-limonene oxidizes to carvone and gamma-terpinene to *p*-cymene. Terpeneless grades of citrus oils are commercially available.

terpenoid. See terpene.

"Terpex."²⁹⁶ Trademark for a polymerized turpentine modified with various additives. Used as a component of coatings, especially aluminum paints.

"Terpex" Extra.²⁰⁶ Trademark for a low molecular weight liquid terpene resin.
Uses: Rubber tackifier and plasticizer; adhesives; resin and oil extender.

para-terphenyl (1,4-diphenylbenzene) $(C_6H_5)_2C_6H_4$.
Properties: Liquid; sp. gr. 1.234 (0°C); m.p. 213°C; b.p. 405°C. Flash point 405°F. Combustible.
Derivation: From para-dibromobenzene, or bromobenzene, and sodium.
Method of purification: Zone-melting.
Grades: Technical; scintillation.
Containers: Glass bottles; fiber drums.
Hazard: Toxic by ingestion and inhalation. Tolerance, 1 ppm in air.
Uses: Polymerized with styrene to make a plastic phosphor. Single crystals used as scintillation counters.

terpinol. See terpineol.

terpinene $C_{10}H_{16}$. A mixture of three isomeric cyclic terpenes, alpha-, beta-, and gamma-terpinene. alpha-Terpinene has a b.p. of 180–182°C and sp. gr. 0.8484 (14°C). It is found in cardamom, marjoram and coriander oils.
beta-Terpinene occurs naturally only in association with alpha-terpinene.
gamma-Terpinene has a b.p. of 183°C and sp. gr. 0.853 (15°C). It is found in coriander, lemon, cumin, and ajawan oils.

terpineol (alpha-terpineol; beta-terpineol; gamma-terpineol; terpinol) $C_{10}H_{17}OH$.

Properties: Colorless liquid or low melting transparent crystals; lilac odor. Usually sold commercially as a mixture of the three isomers. Sp. gr. 0.930–0.936 (25°C); solidification point 2°C; optical rotation between $-0^{\circ} 10'$ and $+0^{\circ} 10'$; boiling range between 214 and 224°C, 90% within 5°C; refractive index (*n* 20/D) 1.4825–1.4850; soluble in 2 vols 70% alcohol; slightly soluble in water, glycerin. Combustible.

Derivation: By heating terpin hydrate with phosphoric acid and distilling, or with dilute sulfuric, using an azeotropic separation; fractional distillation of pine oil. Occurs naturally in several essential oils.

Grades: Technical; perfumery; extra; prime; F.C.C.

Containers: Bottles, tins; drums.

Uses: Solvent for hydrocarbon materials; mutual solvent for resins and cellulose esters and ethers; perfumes; soaps; disinfectant; antioxidant; medicine; flavoring agent.

"Terpineol 318."²⁶⁶ Trademark for a highly refined mixture of tertiary terpene alcohols, predominantly alpha-terpineol; 97% total terpene alcohols. Colorless liquid; f.p. less than $-10^{\circ}C$; sp. gr. 0.937 (15.6/15.6°C); ASTM distillation range 5–95%, 216–220°C.

terpin hydrate (dipentene glycol) A cyclohexane derivative. $CH_3(OH)C_6H_7C(CH_3)_2OH \cdot H_2O$.

Properties: Colorless, lustrous, rhombic crystalline prisms, or white powder; slight characteristic odor; slightly bitter taste; efflorescent; m.p. 115–117°C; anhydrous, m.p. 102–105°C; b.p. 258°C; soluble in alcohol and ether; slightly soluble in water. Combustible.

Derivation: Action of nitric acid and dilute sulfuric acid, or dilute sulfuric alone, on pine oil boiling between 200–220°C.

Grade: Technical: N.F.

Containers: 1-lb cans and cartons: 100-lb net fiber drums.

Uses: Pharmaceuticals; source of terpineol; veterinary medicine.

terpinolene (1,4(8)-terpadiene) $C_{10}H_{16}$.

Properties: Water-white to pale amber liquid. Insoluble in water; soluble in alcohol, ether, glycol. Sp. gr. (15.5/15.5°C) 0.864; b.p. 183–185°C; flash point (closed cup) 99°F; wt/gal 7.2 lbs (15.5°C).

Derivation: Fractionation of wood turpentine.

Hazard: Flammable, moderate fire risk.

Uses: Solvent for resins; essential oils; manufacture of synthetic resins, chemical derivatives.

terpinyl acetate $C_{10}H_{17}OOCCH_3$.

Properties: Colorless liquid; odor suggestive of bergamot and lavender; sp. gr. 0.958–0.968 (15°C); refractive index (*n* 20/D) 1.4640–1.4660; optical rotation varies around 0°; f.p. $-50^{\circ}C$; b.p. 220°C. Soluble in 5 or more vols of 70% alcohol; slightly soluble in water and glycerol. Combustible.

Derivation: By heating terpineol with acetic acid or anhydride in the presence of sulfuric acid, and subsequent distillation.

Grades: Technical; prime; extra; F.C.C.

Containers: Cans; drums.

Uses: Perfumes; flavoring agent.

terpolymer. A polymer made from three monomers, e.g., ABS polymers (q.v.).

"Terraclor."⁸⁴ Trademark for pentachloronitrobenzene (q.v.). Available as technical grade and formulations of 75% wettable powder, 2 lb concentrate, 20% dust, and 10% granular.

Uses: Soil sterilant and fungicide.

"Tersan"^{75, 28} Trademark for a turf fungicide containing 75% thiram.

"Tersan" OM contains 45% thiram and 10% hydroxymercurichlorophenol.

Hazard: Toxic by ingestion and inhalation.

tert-. Abbreviation for tertiary. See primary.

tertiary calcium phosphate. See calcium phosphate, tri-basic.

tertiary sodium phosphate. See sodium phosphate, tri-basic.

"Tervan."⁵¹ Trademark for wax-polymer blends used primarily for coating food cartons.

"Terylene."⁴⁷⁹ Trademark for a synthetic polyester textile fiber based on terephthalic acid. Used in wash-and-wear fabrics.

"Tessalon."³⁰⁵ Trademark for benzonatate.

testosterone $C_{19}H_{28}O_2$. An androgenic steroid; the male sex hormone produced by the testis. It has six times the androgenic activity of its metabolic product, androsterone.

Properties: White or slightly cream-white crystals or as crystalline powder; odorless and stable in air; m.p. 153–157°C; dextrorotatory in dioxane solution. Very soluble in chloroform; soluble in alcohol, dioxane and vegetable oils; slightly soluble in ether; insoluble in water.

Derivation: Isolation from extract of testis; synthesis from cholesterol or from the plant steroid diosgenin.

Grade: N.F.

Containers: Bottles.

Uses: Medicine; biochemical research.

See also methyltestosterone.

"Testryl."⁴¹² Trademark for testosterone (q.v.).

TETD. Abbreviation for tetraethylthiuram disulfide.

tetraaminoditolylmethane $[CH_3C_6H_4(NH_2)_2]_2CH_2$.

Properties: White crystalline powder. Insoluble in water. M.p. 195°C.

Derivation: Condensation of meta-tolylenediamine and formaldehyde.

tetraamylbenzene $(C_5H_{11})_4C_6H_2$.

Properties: Colorless liquid. Sp. gr. at 20°C 0.89; boiling range 320–350°C; odor faintly aromatic; flash point 295°F. Combustible.

Uses: Solvent; chemical intermediate.

tetraazobenzene-beta-naphthol. See benzeneazo-para-benzeneazo-beta-naphthol.

tetra base. See tetramethyldiaminodiphenylmethane.

tetraboric acid. See pyroboric acid.

tetrabromobisphenol A. $(C_6H_2Br_2OH)_2C(CH_3)_2$.

Properties: Off-white powder; m.p. 180–184°C; soluble in methanol and ether; insoluble in water.

Use: Flame retardant for plastics, paper, and textiles.

sym-tetrabromoethane. See acetylene tetrabromide.

tetrabromoethylene C_2Br_4 .

Properties: Colorless crystals; m.p. 55–56°C; b.p. 227°C.

Derivation: Bromination of dibromoacetylene.

Use: Organic synthesis.

tetrabromofluorescein. See eosin.

tetrabromomethane. See carbon tetrabromide.

tetrabromophthalic anhydride $C_6Br_4C_2O_3$.

Properties: Pale yellow crystalline solid; m.p. 280°C.

Use: Flame retardant for plastics, paper, and textiles.

tetra-n-butylammonium chloride $(C_4H_9)_4NCl$.

Properties: Deliquescent, light tan powder; m.p. 50°C.

Uses: Substitute in solution for glass-calomel electrode systems; coagulant for silver iodide solutions; stereo-specific catalyst.

tetrabutylthiuram disulfide $[(C_4H_9)_2NCH]_2S_2$.

Properties: Liquid; amber color; sp. gr. (20/20°C) 1.03–1.06°C; solidifies approx. –30°C; slight sweet odor. Soluble in carbon disulfide, benzene, chloroform, and gasoline; insoluble in water and 10% caustic.

Combustible. Low toxicity.

Uses: Vulcanizing and accelerating agent.

tetrabutylthiuram monosulfide $[(C_4H_9)_2NCS]_2S$.

Properties: Brown, free flowing liquid; sp. gr. 0.99; decomposes at 265°C. Insoluble in water; soluble in acetone, benzene, gasoline, and ethylene dichloride; insoluble in water. Combustible. Low toxicity.

Use: Rubber accelerator.

tetrabutyltin $(C_4H_9)_4Sn$.

Properties: Colorless or slightly yellow oily liquid; sp. gr. 1.0572 (20/4°C); f.p. –97°C; b.p. 145°C (10 mm); decomposes at 265°C. Insoluble in water; soluble in most common organic solvents. Combustible.

Derivation: Reaction of tin tetrachloride with butyl magnesium chloride.

Hazard: Toxic and irritant. Tolerance (as Sn), 0.1 mg per cubic meter of air.

Uses: Stabilizing and rust-inhibiting agent for silicones; lubricant and fuel additive; polymerization catalyst; hydrochloric acid scavenger.

tetrabutyl titanate (TBT; butyl titanate; titanium butyl-ate) $Ti(OC_4H_9)_4$.

Properties: Colorless to light yellow liquid. B.p. 310–314°C; forms a glass below –55°C; sp. gr. 0.996; refractive index 1.486; flash point 170°F; decomposes in water; soluble in most organic solvents except ketones. Combustible.

Derivation: Reaction of titanium tetrachloride with butyl alcohol.

Uses: Ester exchange reactions; heat-resistant paints (up to 500°C); improving adhesion of paints, rubber, and plastics to metal surfaces; cross-linking agent; condensation catalyst.

tetrabutyl urea $(C_4H_9)_2NCON(C_4H_9)_2$.

Properties: Liquid; sp. gr. 0.880; refractive index 1.4535; vapor pressure less than 0.01 mm; b.p. 305°C; f.p. less than –60°C; flash point 200°F; insoluble in water. Combustible, low toxicity.

Use: Plasticizer.

tetrabutyl zirconate $(C_4H_9O)_4Zr$. White solid from reaction of zirconium tetrachloride with butyl alcohol.

Uses: Condensation catalyst and cross-linking agent.

tetracaine $CH_3(CH_2)_3NHC_6H_4COOCH_2CH_2N(CH_3)_2$.

2-Dimethylaminoethyl para-butylaminobenzoate.

Properties: White or light yellow, waxy solid. Very slightly soluble in water; soluble in alcohol, ether, benzene, chloroform. M.p. 41–46°C.

Grade: U.S.P.

Use: Medicine. (Also available as the hydrochloride).

tetracalcium aluminoferrate. An ingredient of Portland cement.

1,2,3,4-tetracarboxybutane (TCB; 1,2,3,4-butanetetracarboxylic acid)

$\text{HOOCCH}_2\text{CH}(\text{COOH})\text{CH}(\text{COOH})\text{CH}_2\text{COOH}$.

Uses: Alkyd resins; epoxy curing agent; sequestant.

tetracene. See naphthacene.

tetracine. See tetrazene.

1,2,3,4-tetrachlorobenzene $\text{C}_6\text{H}_2\text{Cl}_4$.

Properties: White crystals; m.p. 46.6°C ; b.p. 254°C ; insoluble in water. Low toxicity. Combustible.

Uses: Component of dielectric fluids; synthesis.

1,2,4,5-tetrachlorobenzene $\text{C}_6\text{H}_2\text{Cl}_4$.

Properties: White flakes; m.p. $137.5\text{--}140^\circ\text{C}$; flash point 311°F ; distillation range $240\text{--}246^\circ\text{C}$. Low toxicity. Combustible.

Uses: Intermediate for herbicides and defoliants; insecticide; impregnant for moisture resistance; electrical insulation; temporary protection in packing.

tetrachloro-para-benzoquinone. See chloranil.

tetrachlorobisphenol A $(\text{C}_6\text{H}_2\text{Cl}_4\text{OH})_2\text{C}(\text{CH}_3)_2$. A monomer for flame-retardant epoxy, polyester and polycarbonate resins.

2,3,7,8-tetrachlorodibenzo-*p*-dioxin. See dioxin.

sym-tetrachlorodifluoroethane $\text{CCl}_2\text{FCCl}_2\text{F}$.

Properties: White solid or colorless liquid with slightly camphor-like odor when concentrated. B.p. 92.8°C ; m.p. 26°C ; critical temperature 278°C ; sp. gr. (25°C) 1.6447; refractive index (25°C) 1.413; wt/gal 13.8 lbs. Nonflammable. Insoluble in water; soluble in alcohol.

Grades: Purified; solvent.

Hazard: Moderately toxic by inhalation. Tolerance, 500 ppm in air.

Use: Degreasing solvent.

tetrachlorodinitroethane $\text{O}_2\text{NCCl}_2\text{CCH}_2\text{NO}_2$.

Properties: White crystals; decomposes at 130°C to nitrogen peroxide.

Hazard: Highly toxic by ingestion and inhalation. Strong irritant.

Shipping regulations: (Air) Not acceptable. (Rail) Poisonous solids, n.o.s., Poison label.

tetrachlorodiphenylethane. See TDE.

tetrachlorodiphenyl sulfone. See tetradifon.

sym-tetrachloroethane (acetylene tetrachloride)

$\text{CHCl}_2\text{CHCl}_2$.

Properties: Heavy, colorless, corrosive liquid. Chloroform-like odor. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 1.593 ($25/25^\circ\text{C}$); b.p. 146.5°C ; f.p. -43°C ; weight 13.25 lbs/gal (25°C); refractive index 1.4918 (25°C); flash point none. Nonflammable. Derivation: Reaction of acetylene and chlorine, and subsequent distillation.

Grade: Technical.

Containers: 55-gal drums.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Tolerance, 5 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Solvent; cleansing and degreasing metals; paint removers, varnishes, lacquers, photographic film; resins and waxes; extraction of oils and fats; alcohol denaturant; organic synthesis; insecticides; weed killer; fumigant.

Shipping regulations: (Rail) Poisonous liquid, n.o.s., Poison label. (Air) Poison label.

tetrachloroethylene. See perchloroethylene.

cis-N-[(1,1,2,2-tetrachloroethyl)thio]-4-cyclohexene-1,2-dicarboximide ("Difolatan"). $\text{C}_{10}\text{H}_9\text{Cl}_4\text{NO}_2\text{S}$.

Properties: White solid; m.p. 160°C ; slightly soluble in most organic solvents; insoluble in water.

Use: Fungicide.

tetrachloromethane. See carbon tetrachloride.

tetrachloronaphthalene. See chlorinated naphthalene.

2,3,4,6-tetrachlorophenol $\text{C}_6\text{HCl}_4\text{OH}$.

Properties: Brown flakes or sublimed mass with a strong odor; m.p. $69\text{--}70^\circ\text{C}$; b.p. 164°C (23 mm); sp. gr. $25^\circ/4^\circ\text{C}$ 1.839; soluble in acetone, benzene, ether, and alcohol. Nonflammable.

Hazard: Toxic by ingestion and inhalation; strong irritant.

Use: Fungicide.

2,4,5,6-tetrachlorophenol $\text{C}_6\text{HCl}_4\text{OH}$.

Properties: Brown solid; phenol odor. Sp. gr. 1.65 at $60/4^\circ\text{C}$; m.p. $>50^\circ\text{C}$. Soluble in sodium hydroxide solutions and most organic solvents; insoluble in water.

Hazard: Toxic by ingestion and inhalation; strong irritant.

Uses: Fungicide; wood preservative.

tetrachlorophthalic acid $\text{C}_6\text{Cl}_4(\text{CO}_2\text{H})_2$.

Properties: Colorless, crystalline plates. Soluble in hot water; sparingly soluble in cold water.

Derivation: By passing a stream of chlorine through a mixture of phthalic anhydride and antimony pentachloride.

Uses: Dyes; intermediates.

tetrachlorophthalic anhydride $\text{C}_6\text{Cl}_4(\text{CO})_2\text{O}$.

Properties: White, odorless, free-flowing, nonhygroscopic powder; slightly soluble in water; m.p. $254\text{--}255^\circ\text{C}$; b.p. 371°C .

Containers: Fiber drums.

Uses: Intermediate in dyes, pharmaceuticals, plasticizers, and other organic materials; flame-retardant in epoxy resins.

tetrachloroquinone. See chloranil.

tetrachlorothiophene CClCClCClCClS .

Properties: Liquid. M.p. $29\text{--}30^\circ\text{C}$; b.p. 104°C (10 mm). Soluble in benzene, hexane, alcohols, chlorocarbons.

Hazard: May be toxic.

Uses: Agricultural chemicals; lubricants.

tetracosane $\text{C}_{24}\text{H}_{50}$ and $\text{CH}_3(\text{CH}_2)_{22}\text{CH}_3$.

Properties: Crystals; soluble in alcohol; insoluble in water. Sp. gr. 0.779 ($51^\circ/4^\circ\text{C}$); b.p. 324.1°C ; m.p. 51.5°C . Combustible; low toxicity.

Use: Organic synthesis.

n-tetracosanoic acid. See lignoceric acid.

tetracyanoethylene $(\text{CN})_2\text{C}:\text{C}(\text{CN})_2$. The first member of a class of compounds called cyanocarbons.

Properties: Colorless crystals; sublimes above 120°C ; m.p. $198\text{--}200^\circ\text{C}$; b.p. 223°C . High thermal stability; burns in oxygen with a hotter flame than acetylene.

Hazard: Hydrolyzes in moist air to hydrogen cyanide.

Uses: Organic synthesis; dyes; to make colored solutions with aromatics.

tetracycline $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8 \cdot 0$ to $6\text{H}_2\text{O}$. An antibiotic obtained from certain *Streptomyces* species. It can also be prepared by catalytic hydrogenation of chlortetracycline or oxytetracycline, which it resembles in its

actions and uses. Its chemical structure is that of a modified naphthacene molecule. See naphthacene.

Properties: Yellow, odorless, crystalline powder. Stable in air; affected by strong sunlight. Potency affected in solutions with pH below 2 and destroyed in alkali hydroxide solutions. Practically insoluble in chloroform and ether; very slightly soluble in water; slightly in alcohol; very soluble in dilute hydrochloric acid and alkali hydroxide solutions; pH (saturated solution) 3.0–7.0. Induces fluorescence in mitochondria of living cells in tissue culture or in fresh preparations from various organs.

Grade: U.S.P.

Hazard: May be toxic side effects.

Use: Medicine (also available as the hydrochloride).

"Tetracycl."²⁹⁹ Trademark for tetracycline hydrochloride.

n-tetradecane $C_{14}H_{30}$ and $CH_3(CH_2)_{12}CH_3$.

Properties: Colorless liquid; sp. gr. (20/4°C) 0.7653; m.p. 5.5°C; b.p. 253.5°C; refractive index (n_D 20) 1.4302; flash point 212°F. Autoignition temp. 396°F. Soluble in alcohol; insoluble in water. Combustible. Grades: 95%, 99%.

Containers: Bottles; small drums.

Hazard: Lower flammable limit in air 0.5%.

Uses: Organic synthesis; solvent; standardized hydrocarbon; distillation chaser.

tetradecanoic acid. See myristic acid.

tetradecanol. See myristyl alcohol; see also 7-ethyl-2-methyl-4-undecanol.

1-tetradecene (alpha-tetradecylene)

$CH_2:CH(CH_2)_{11}CH_3$.

Properties: Colorless liquid; density 0.775 g/ml (20/4°C); f.p. -12°C; b.p. 256°C; flash point 230°F. Insoluble in water; very slightly soluble in alcohol and ether. Combustible.

Uses: Solvent in perfumes, flavors, medicines, dyes, oils, resins.

cis-tetradec-9-enoic acid. See myristoleic acid.

tetradecylamine $C_{14}H_{29}NH_2$.

Properties: White solid with odor of ammonia; m.p. 37°C; b.p. 291.2°C; insoluble in water; soluble in alcohol and ether. Combustible.

Grade: 90% purity.

Containers: Drums; tank cars.

Uses: Intermediate for manufacture of cationic surface-active agents; germicides.

tetradecylbenzyltrimethylammonium chloride monohydrate $[C_{14}H_{29}N(CH_3)_3CH_2C_6H_5]Cl \cdot H_2O$. A quaternary ammonium salt.

Properties: (Of a 50% solution in aqueous isopropanol). Viscous liquid which may gelatinize on standing; sp. gr. 0.978 (16°C); miscible with water, alcohol, glycerin and acetone; pH of a 10% solution in distilled water 7–8.

Grade: 50% solution in aqueous isopropanol.

Use: Production of bacteriostatic and fungistatic paper.

tetradecyl chloride (myristyl chloride) $CH_3(CH_2)_{13}Cl$.

Properties: Water-white distilled liquid, mild odor. Sp. gr. 0.8590; f.p. -0.2°C; b.p. 154–155°C (15 mm); 15.2% chloride; subject to mild hydrolysis on standing.

Grade: 97% min.

alpha-tetradecylene. See 1-tetradecene.

tetradecyl thiol (myristyl mercaptan) $CH_3(CH_2)_{13}SH$.

Properties: Liquid; m.p. 6.5°C; b.p. 176–180°C (22

mm); sp. gr. 0.8398 (25/4°C); refractive index 1.4612 (n_D 20); strong odor; combustible.

Grade: 95% (min) purity.

Hazard: Moderately toxic by inhalation; strong irritant.

Uses: Organic intermediate; synthetic rubber processing.

tetradifon. Generic name for 4-chlorophenyl 2,4,5-trichlorophenyl sulfone (2,4,4',5-tetrachlorodiphenylsulfone), $Cl_3C_6H_2SO_2C_6H_4Cl$.

Properties: White crystalline powder; m.p. 147°C. Soluble in chloroform and aromatic hydrocarbons; insoluble in water.

Hazard: Probably toxic.

Use: Insecticide; acaricide.

tetra(diphenylphosphito) pentaerythritol. See pentaerythritol tetrakis(diphenyl phosphite).

tetraethanolammonium hydroxide $(HOCH_2CH_2)_4NOH$. Properties: White, crystalline solid; m.p. 123°C; vapor pressure less than 0.01 mm (20°C); completely soluble in water. A strong base, approaching sodium hydroxide in alkalinity. Aqueous solutions are stable at room temperature but decompose on heating to weakly basic polyethanolamines.

Grades: Commercial grade is a 40% water solution.

Containers: 1-gal cans; 5-, 55-gal drums.

Hazard: Strong irritant to skin and tissue.

Uses: Alkaline catalyst; solvent for certain types of dyes; screen printing of dyes; metal-plating solutions.

1,1,3,3-tetraethoxypropane $[(C_2H_5O)_2CH]_2CH_2$.

Properties: Liquid; b.p. 105°C; refractive index 1.410 (n_D 20); sp. gr. 0.920 (20/20°C); slightly soluble in water; soluble in ether and alcohol; flash point 190°F. Combustible; low toxicity.

Containers: 55-gal drums.

Use: Organic synthesis.

tetraethylammonium chloride (TEAC; TEA chloride) $(C_2H_5)_4NCl$.

Properties: Anhydrous: Colorless, odorless, hygroscopic crystals; sp. gr. 1.080; freely soluble in water, alcohol, chloroform, acetone; slightly soluble in benzene and ether. Tetrahydrate: $(C_2H_5)_4NCl \cdot 4H_2O$, crystals; m.p. 37.5°C; sp. gr. 1.084.

Use: Medicine.

tetraethylammonium hexafluorophosphate

$(C_2H_5)_4NPF_6$.

Properties: Solid; m.p. 255°C; nonhygroscopic, but soluble in water. Stable to heat; can be stored in solution without decomposition of the PF_6 ion.

Hazard: Toxic and irritant to skin.

Uses: Maintenance of fluoride atmospheres; preparation of bactericides and fungicides.

tetra-(2-ethylbutyl) silicate $[(C_2H_5)_4C_4H_9O]_4Si$.

Properties: Colorless liquid. Sp. gr. (20/20°C) 0.8920–0.9018; f.p. below -100°C; b.p. 238°C (50 mm); insoluble in water; slightly soluble in methanol; miscible with most organic solvents.

Uses: Heat-transfer medium; hydraulic fluid; wide temperature-range lubricant.

tetraethyl dithionopyrophosphate (TEDP).

$(C_2H_5O)_4P_2OS_2$.

Properties: Liquid; sp. gr. 1.19; b.p. 138°C; insoluble in water; soluble in alcohol. Combustible.

Hazard: Highly toxic. Absorbed by skin. Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: (Rail, Air) Organic phosphate, liquid, n.o.s., Poison label. Not accepted on passenger planes.

tetraethyl dithiopyrophosphate. See sulfotepp.

tetraethylene glycol (TEG) $\text{HO}(\text{C}_2\text{H}_4\text{O})_3\text{C}_2\text{H}_4\text{OH}$.

Properties: Colorless liquid; hygroscopic. Soluble in water; insoluble in benzene, toluene, or gasoline. Sp. gr. 1.1248 at 20/20°C; f.p. -4°C ; b.p. 327.3°C ; vapor pressure >0.001 mm (20°C); refractive index 1.4577 ($n_{20/D}$); flash point 345°F ; wt/gal 9.4 lb (20°C). Combustible. Low toxicity.

Containers: Cans; drums.

Uses: Solvent for nitrocellulose; plasticizer; lacquers; coating compositions.

tetraethylene glycol dibutyl ether. See dibutoxytetraglycol.

tetraethylene glycol dimethacrylate

Properties: Water-white to pale straw liquid; b.p. (1 mm) 200°C ; sp. gr. (20/20°C) 1.075; refractive index (20°C) 1.4620; viscosity 12 cp; insoluble in water; soluble in styrene, many esters and aromatics; limited solubility in aliphatic hydrocarbons. Combustible.

Hazard: Irritant to skin and eyes.

Use: Plasticizer.

tetraethylene glycol dimethyl ether. See dimethoxytetraglycol.

tetraethylene glycol distearate

$(\text{C}_{17}\text{H}_{35}\text{COOCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2)_2\text{O}$.

Properties: Liquid. M.p. $32\text{--}33^\circ\text{C}$; insoluble in water. Combustible.

Use: Plasticizer.

tetraethylene glycol monostearate

$\text{C}_{17}\text{H}_{35}\text{COO}(\text{CH}_2\text{CH}_2\text{O})_4\text{H}$.

Properties: Liquid. Sp. gr. 0.971; m.p. $30\text{--}31^\circ\text{C}$; insoluble in water. Combustible.

Use: Plasticizer.

tetraethylenepentamine

$\text{NH}_2(\text{CH}_2\text{CH}_2\text{NH})_3\text{CH}_2\text{CH}_2\text{NH}_2$.

Properties: Viscous, hygroscopic liquid. Sp. gr. 0.9980 at 20/20°C; f.p. -30°C ; b.p. 333°C ; vapor pressure >0.01 mm (20°C); wt/gal 8.3 lb (20°C). Flash point 325°F . Soluble in most organic solvents and water. Combustible.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Hazard: Toxic and strong irritant to eyes and skin.

Uses: Solvent for sulfur, acid gases, various resins and dyes; saponifying agent for acidic materials; manufacture of synthetic rubber; dispersant in motor oils; intermediate for oil additives.

tetra-(2-ethylhexyl) silicate $[\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{O}]_4\text{Si}$.

Properties: Colorless liquid. Sp. gr. 0.8838; b.p. $350\text{--}370^\circ\text{C}$; f.p. -90°C ; solubility in water <0.01 pounds/gallon 7.4; flash point 390°F . Combustible.

Uses: Synthetic lubricants and functional fluids.

tetra-(2-ethylhexyl) titanate (tetrakis(2-ethylhexyl) titanate) $[\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{O}]_4\text{Ti}$. Light yellow, viscous liquid from the transesterification of isopropyl titanate with 2-ethylhexanol. Combustible; low toxicity.

Uses: Crosslinking agent; condensation catalyst; adhesion promoter; water repellents.

tetraethyllead (TEL) $\text{Pb}(\text{C}_2\text{H}_5)_4$.

Properties: Colorless, oily liquid; pleasant odor. Soluble in all organic solvents. Insoluble in water and dilute acids or alkalis. Sp. gr. 1.65; b.p. $198\text{--}202^\circ\text{C}$; $75\text{--}85^\circ\text{C}$ (13–14 mm); f.p. -136°C ; decomposes

slowly at room temperature, rapidly at $125\text{--}150^\circ\text{C}$. Combustible.

Derivation: (a) Alkylation of lead-sodium alloy with ethyl chloride; (b) electrolysis of an ethyl Grignard reagent, with an anode of lead pellets.

Grade: One grade only—approximately 98% pure.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Tolerance (as Pb), 0.1 mg per cubic meter of air.

Uses: Aviation gasoline; other automotive gasoline; ethylation operations.

Note: While organic lead compounds are unquestionably toxic, the extent to which their presence in automobile exhaust fumes is a public health risk remains controversial. The consumption of TEL in gasolines has been reduced considerably in recent years, partly because of their contribution to air pollution and partly because they poison the platinum catalysts used in emission control devices. Even so-called lead-free gasolines contain trace quantities of lead compounds. See also antiknock agent.

Shipping regulations: (Rail, Air) Poison label. Not accepted on passenger planes.

tetraethyl orthosilicate. See ethyl silicate.

tetraethyl pyrophosphate. See tepp.

tetraethylthiuram disulfide [disulfiram; TTD; TETD; bis(diethylthiocarbamyl) disulfide] $[(\text{C}_2\text{H}_5)_2\text{NCS}]_2\text{S}_2$.

Properties: Light gray powder; sp. gr. 1.27; melting range $65\text{--}70^\circ\text{C}$; slight odor. Soluble in carbon disulfide, benzene and chloroform; insoluble in water.

Containers: 5-, 50-, 100-, 150-lb drums.

Hazard: Produces toxic symptoms only when ingested in presence of alcohol.

Uses: Fungicide and insecticide; treatment of alcoholism; ultra-accelerator for rubber.

tetraethylthiuram sulfide [bis-(diethylthiocarbamyl) sulfide] $[(\text{C}_2\text{H}_5)_2\text{NCS}]_2\text{S}$.

Properties: Dark brown powder; slight odor; sp. gr. (20/20°C) 1.12; boiling range $225\text{--}240^\circ\text{C}$ (3 mm).

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Pharmaceutical ointments; fungicide; insecticide.

tetraethyltin $\text{Sn}(\text{C}_2\text{H}_5)_4$.

Properties: Colorless liquid; sp. gr. (23°C) 1.187; b.p. 181°C ; f.p. -112°C ; insoluble in water; soluble in alcohol and ether.

Hazard: Toxic. Tolerance (as Sn), 0.1 mg per cubic meter of air.

"Tetra-Flex."⁵¹¹ Trademark for internally plasticized resins based on polymethylene polyphenol. Permanent flexibility makes them suitable for industrial and electrical laminates.

tetrafluorodichloroethane. See dichlorotetrafluoroethane.

tetrafluoroethylene (perfluoroethylene; TFE) $\text{F}_2\text{C}=\text{CF}_2$. Monomer for polytetrafluoroethylene polymers.

Properties: Colorless gas; f.p. -142.5°C ; b.p. -78.4°C ; insoluble in water. Much heavier than air.

Derivation: By passing chlorodifluoromethane through a hot tube.

Hazard: Flammable, dangerous fire risk.

Shipping regulations: Inhibited: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. Uninhibited: (Air) Not acceptable.

tetrafluoroethylene epoxide (TFEO). FCF_2CF_2 .

Derivation: Oxidation of tetrafluoroethylene at 120°C with ultraviolet light. Reaction proceeds by free-radical mechanism.

Use: Monomer for products ranging from dimers to polymers of d.p. 35. See also "Freon E" and "Krytox."

tetrafluorohydrazine F_2NNF_2 .

Properties: Colorless mobile liquid or colorless gas; b.p. (calc) -73°C ; heat of vaporization 3170 cal/mole; critical temperature 36°C .

Hazard: Toxic and irritant. Explodes in contact with reducing agents and at high pressures.

Uses: Organic synthesis; oxidizer in fuels for rockets, missiles, etc.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

tetrafluoromethane (fluorocarbon 14; carbon tetrafluoride) CF_4 .

Properties: Colorless gas; f.p. -184°C ; b.p. -128°C ; slightly soluble in water. Nonflammable. Density of liquid 1.96 g/ml at -184°C ; sp. vol. (70°F) 4.4 cu ft/lb.

Grade: 95% min purity.

Containers: Steel cylinders.

Hazard: Moderately toxic by inhalation.

Uses: Refrigerant; gaseous insulator.

Shipping regulations: (Air) Nonflammable Gas label.

tetraglycol dichloride $(\text{ClCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2)_2\text{O}$.

Properties: Colorless liquid. Slightly miscible with water. Sp. gr. 1.186; b.p. (2 mm) 114°C . Combustible; low toxicity.

Uses: High-boiling solvent and extractant for oils, fats, waxes and greases; chemical intermediate.

tetragrammaton. A compound formula which can be represented by four capital letters, e.g., HCCH .

1,2,3,6-tetrahydrobenzaldehyde. See 3-cyclohexene-1-carboxaldehyde.

1,2,3,4-tetrahydrobenzene. See cyclohexene.

tetrahydrocannabinol. The active principle of marijuana; a hallucinatory drug. It has been synthesized and is available in laboratory quantities, subject to legal restrictions. It is comparatively nontoxic; animal tests have indicated that it can retard cancer growth and also may promote the acceptance of organ transplants in the human body.

tetrahydrofuran (THF) $\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{O}$.

Properties: Water-white liquid with ethereal odor; sp. gr. (20°C) 0.888; refractive index (n $20/\text{D}$) 1.4070; f.p. -65°C ; b.p. 66°C ; flash point (open cup) 5°F . Autoignition temp. 610°F . Soluble in water and organic solvents. Low toxicity.

Derivation: (1) Catalytic hydrogenation of furan with nickel catalyst. (2) Acid-catalyzed dehydration of 1,4-butanediol.

Grades: Technical; spectrophotometric.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire risk. Tolerance, 200 ppm in air. Flammable limits in air 2 to 11.8%.

Uses: Solvent for natural and synthetic resins, particularly vinyls, in topcoating solutions, polymer coating, cellophane, protective coatings, adhesives, magnetic tapes, printing inks, etc. Grignard reactions, lithium aluminum hydride reductions, and polymerizations; chemical intermediate and monomer.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

tetrahydrofurfuryl acetate $\text{C}_4\text{H}_7\text{OCH}_2\text{OOCCH}_3$.

Properties: Colorless liquid. Soluble in water, alcohol, ether, and chloroform. Sp. gr. 1.061 ($20/0^\circ\text{C}$); b.p. $194-195^\circ\text{C}$ (753 mm). Low toxicity. Combustible.

Derivation: By treatment of tetrahydrofurfuryl alcohol with acetic anhydride.

Use: Flavoring.

tetrahydrofurfuryl alcohol ("THFA"; tetrahydrofuryl carbinol) $\text{C}_4\text{H}_7\text{OCH}_2\text{OH}$.

Properties: Colorless liquid; mild odor; hygroscopic; miscible with water; sp. gr. 1.0543 ($20/20^\circ\text{C}$); b.p. 178°C ; refractive index 1.4520 ($20/\text{D}$); flash point (open cup) 167°F ; viscosity 5.49 cp (25°C). Autoignition temp. 540°F . Combustible. Low toxicity.

Derivation: Catalytic hydrogenation of furfural.

Grades: Commercial; industrial (about 80%).

Containers: Cans; 55-gal drums; tank cars; tank trucks.

Uses: Solvent for vinyl resins, dyes for leather; chlorinated rubber; cellulose esters; solvent-softener for nylon; vegetable oils; coupling agent.

tetrahydrofurfurylamine $\text{C}_4\text{H}_7\text{OCH}_2\text{NH}_2$.

Properties: Colorless to light yellow liquid; refractive index 1.4520-1.4535 (25°C); distilling range -150 to -156°C . Combustible. Low toxicity.

Uses: Chemical intermediate; fine grain photographic development; vulcanization accelerator.

tetrahydrofurfuryl benzoate $\text{C}_4\text{H}_7\text{OCH}_2\text{OOCCH}_2\text{C}_6\text{H}_5$.

Properties: Colorless liquid; insoluble in water; soluble in alcohol, ether, and chloroform. Sp. gr. 1.137 ($20/0^\circ\text{C}$); b.p. $300-302^\circ\text{C}$, $138-140^\circ\text{C}$ (2 mm). Combustible. Low toxicity.

Derivation: Tetrahydrofurfuryl alcohol and benzoic acid by esterification.

Uses: Chemical intermediate.

tetrahydrofurfuryl laurate $\text{C}_4\text{H}_7\text{OCH}_2\text{OOC}_{11}\text{H}_{23}$.

Properties: Colorless liquid. Sp. gr. (25°C) 0.930; insoluble in water. Combustible.

Use: Plasticizer.

tetrahydrofurfuryl levulinate

$\text{CH}_3\text{CO}(\text{CH}_2)_3\text{COOCH}_2\text{C}_4\text{H}_7\text{O}$.

Properties: Colorless liquid. M.p. $59-61^\circ\text{C}$; soluble in water. Combustible.

Use: Plasticizer.

tetrahydrofurfuryl oleate $\text{C}_{17}\text{H}_{33}\text{COOCH}_2\text{C}_4\text{H}_7\text{O}$.

Properties: Colorless liquid; sp. gr. (25°C) 0.923; b.p. (5 mm) 240°C ; f.p. -30°C ; insoluble in water. Flash point 329°F . Combustible.

Containers: 1-, 5-, 55-gal drums.

Use: Plasticizer.

tetrahydrofurfuryl phthalate $\text{C}_6\text{H}_4(\text{COOCH}_2\text{C}_4\text{H}_7\text{O})_2$.

Properties: Colorless liquid. Sp. gr. (25°C) 1.194; m.p. less than 15°C ; insoluble in water. Combustible.

Use: Plasticizer.

tetrahydrofuryl carbinol. See tetrahydrofurfuryl alcohol.

tetrahydrogeraniol. See 3,7-dimethyl-1-octanol.

tetrahydrolinalool (3,7-dimethyl-3-octanol) $\text{C}_{10}\text{H}_{21}\text{OH}$.

Properties: Colorless liquid; floral odor. Sp. gr. 0.832-0.837; optically inactive. Combustible.

Containers: Up to 55-gal drums.

Uses: Perfumery; flavoring.

1,2,3,4-tetrahydro-6-methylquinoline $\text{C}_{10}\text{H}_{13}\text{N}$.

Properties: Yellowish crystals; strong civet-like odor;

m.p. 33°C; soluble in 2 parts 80% alcohol. Combustible.

Use: Perfumery.

tetrahydronaphthalene $C_{10}H_{12}$.

Properties: Colorless liquid; pungent odor. Miscible with most solvents, and compatible with natural and synthetic vehicles; insoluble in water. Sp. gr. 0.981 at 13°C; b.p. 206°C; refractive index 1.540–1.547; flash point 160°F; freezing point –25°C; moisture content none; residue on evaporation none; acidity neutral; wt/gal approx. 8 lbs. Autoignition temp. 723°F; combustible.

Derivation: Hydrogenation of naphthalene in the presence of a catalyst at 150°C.

Grade: Technical.

Containers: 50-gal drums.

Hazard: Moderately toxic and irritant. Narcotic in high concentrations.

Uses: Solvent; chemical intermediate.

tetrahydrophthalic anhydride $C_6H_8(CO)_2O$.

Properties: White crystalline powder, solidification point 99–101°C; sp. gr. (105°C) 1.20; slightly soluble in petroleum ether and ethyl ether; soluble in benzene. Flash point 315°F (open cup); combustible.

Derivation: Diels-Alder reaction of butadiene and maleic anhydride.

Containers: Fiber drums.

Uses: Chemical intermediate for light-colored alkyds, polyesters, plasticizers and adhesives; intermediate for pesticides; hardener for resins.

tetrahydropyran-2-methanol

$OCH_2CH_2CH_2CH_2CHCH_2OH$.

Properties: Liquid; sp. gr. (20°C) 1.0272; b.p. 187.2°C; f.p., sets to glass below –70°C; miscible with water.

Flash point 200°F (open cup). Combustible.

Containers: Cans; drums.

Use: Chemical intermediate.

1,2,5,6-tetrahydropyridine C_5H_7N .

Properties: Colorless liquid. Sp. gr. (20/4°C) 0.912–0.914; f.p. –44°C; b.p. 115.5–120.0°C. Combustible. Purity: 96% min.

Use: Organic intermediate.

tetrahydrothiophene (thiophane) $CH_2CH_2CH_2CH_2S$.

Properties: Water-white liquid; sp. gr. 1.00 (15.6/15.6°C); boiling range 115–124.4°C. Combustible.

Uses: Solvent; intermediate; fuel gas odorant.

tetrahydrothiophene 1,1-dioxide. See sulfolane.

tetrahydroxyadipic acid. For two of fourteen possible isomers, see mucic acid; saccharic acid.

tetrahydroxybutane. See erythritol.

tetrahydroxydiphenyl. See diresorcinol.

tetrahydroxyethylethylenediamine [N,N,N',N' -tetrakis-(2-hydroxyethyl)ethylenediamine] $(HOCH_2CH_2)_2NCH_2CH_2N(CH_2CH_2OH)_2$.

Properties: Clear, viscous liquid; good heat stability; combustible; low toxicity.

Uses: Organic intermediate; crosslinking of rigid polyurethane foams; chelating agent; humectant; gas absorbent; resin formation; detergent processing.

2,3,4,5-tetrahydroxyhexanedioic acid. See D-saccharic acid.

tetraiodoethylene (iodoethylene) $I_2C:Cl_2$.

Properties: Light-yellow, odorless crystals; on exposure

to light turns brown; m.p. 187°C; sp. gr. 2.98. Insoluble in water; soluble in most organic solvents.

Derivation: Action of iodine on diiodoacetylene obtained from calcium carbide and iodine.

Uses: Surgical dusting powder; antiseptic ointment; fungicide.

tetraiodofluorescein. See iodeosin.

tetraisopropylthiuram disulfide $[(CH_3CH_2CH_2)_2NCS]S_2$.

Properties: Tan powder; sp. gr. (20/20°C) 1.12; melting range 95–99°C; amine odor. Soluble in benzene, chloroform, gasoline; insoluble in water, 10% caustic, carbon disulfide.

Use: Rubber accelerator.

tetraisopropyl titanate (TPT; titanium isopropylate; isopropyl titanate) $Ti[OCH(CH_3)_2]_4$.

Properties: Light-yellow liquid which fumes in moist air. B.p. (10 mm) 102–104°C; m.p. 14.8°C; sp. gr. 0.954; index of refraction 1.46; apparent viscosity (25°C) 2.11 cp. Decomposes rapidly in water; soluble in most organic solvents.

Derivation: Reaction of titanium tetrachloride with isopropanol.

Uses: Ester exchange reactions; adhesion of paints, rubber, and plastics to metals, condensation catalyst.

tetraisopropyl zirconate $Zr[OCH(CH_3)_2]_4$.

Properties: White solid; decomposes before melting.

Derivation: By reaction of zirconium tetrachloride with isopropanol.

Uses: Condensation catalyst; crosslinking agent.

tetrakis(hydroxymethyl)phosphonium chloride (THPC) $(HOCH_2)_4P.Cl$. A crystalline compound made by the

reaction of phosphine, formaldehyde and hydrochloric acid.

Uses: Flame-retarding agent for cotton fabrics. May be used in combination with triethylamine and urea (Roxel process) or with triethanolamine and tris(1-aziridinyl) phosphine oxide.

N,N,N',N' -tetrakis(2-hydroxypropyl)ethylenediamine (ethylenedinitrilotetra-2-propanol)

$[-CH_2N(CH_2CHOHCH_3)_2]_2$.

Properties: Viscous, water-white liquid; infinitely soluble in water; soluble in ethyl alcohol, toluene, ethylene glycol and perchloroethylene. Combustible.

Uses: Cross-linking agent and catalyst in urethane foams; epoxy resin curing; metal complexes; intermediate.

"Tetralin."²⁸ Trademark for tetrahydronaphthalene (q.v.).

tetralite. See tetryl.

1-tetralone $CHCHCHCHCCCH_2CH_2CH_2CO$. A ketone of tetrahydronaphthalene.

Properties: Liquid; sp. gr. 1.090–1.095 (20/20°C); b.p. 120–125°C (10 mm); vapor-pressure 0.02 mm (20°C); m.p. 5.3–6.0°C. Insoluble in water. Flash point 265°F. Combustible.

Grade: Solvent and intermediate.

tetram (O,O-Diethyl-S-(β-diethylamino)-ethyl phosphorothioate hydrogen oxalate) $(C_2H_5O)_2POSCH_2CH_2N(C_2H_5)_2$.

Hazard: Toxic by ingestion and inhalation. Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: (Rail, Air) Organic phosphate, n.o.s., Poison label. Not accepted on passenger planes.

tetramer. An oligomer whose molecule is composed of four molecules of the same chemical composition. See also polymer.

1,1,3,3-tetramethoxypropane $[(\text{CH}_3\text{O})_2\text{CH}]_2\text{CH}_2$.

Properties: Liquid; b.p. 183°C ; refractive index 1.408 ($n_{20/\text{D}}$); sp. gr. 0.995 ($20/20^\circ\text{C}$); soluble in water, hexane, ether and alcohol. Combustible.

Containers: 55-gal drums.

Use: Organic synthesis.

tetramethylammonium chloride $(\text{CH}_3)_4\text{NCl}$. A quaternary ammonium compound.

Properties: White crystalline solid; sp. gr. 1.1690 ($20/4^\circ\text{C}$); m.p., decomposes. Soluble in water and alcohol; insoluble in ether. Also available as a 50% solution.

Uses: Chemical intermediate; catalyst; inhibitor.

tetramethylammonium chlorodibromide $(\text{CH}_3)_4\text{NClBr}_2$.

Properties: Powder, M.p. $118\text{--}126^\circ\text{C}$. Soluble in water and other polar solvents.

Hazard: Evolves bromine on contact with water.

Uses: Dry brominating agent; ingredient in formulation of sanitizers.

tetramethylammonium hydroxide $(\text{CH}_3)_4\text{NOH}$.

Hazard: Highly toxic; strong irritant to skin and tissue. Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. Corrosive label. (Air).

1,2,3,5-tetramethylbenzene. See isodurene.

sym-tetramethylbenzene. See durene.

N,N,N',N'-tetramethyl-1,3-butanedi-amine

$\text{CH}_3\text{CHN}(\text{CH}_3)_2\text{CH}_2\text{CH}_2\text{N}(\text{CH}_3)_2$.

Properties: Colorless, stable liquid, f.p. below -100°C ; b.p. 165.0°C ; sp. gr. 0.8020 ($20/20^\circ\text{C}$); vapor pressure 1.64 mm (20°C); miscible in all proportions with water; viscosity 1.0 cp (20°C). Flash point 114°F (TOC). Combustible.

Uses: Catalyst for polyurethane foams and epoxy resins; high-energy fuels.

2,2,4,4-tetramethyl-1,3-cyclobutanediol

$(\text{CH}_3)_4\text{C}_4\text{H}_2(\text{OH})_2$.

Properties: White solid; m.p. $124\text{--}135^\circ\text{C}$; b.p. $220\text{--}225^\circ\text{C}$. Isomer composition (approx) 50% cis, 50% trans. Flash point 125°F .

Hazard: Moderate fire risk; moderately toxic and irritant.

Uses: Chemical intermediate; lubricants.

tetramethyldiamidophosphoric fluoride. See dimefox.

tetramethyldiaminobenzhydrol (tetramethyldiaminodiphenylcarbinol; Michler's hydrol; hydrol)

$(\text{CH}_3)_2\text{NC}_6\text{H}_4\text{CH}(\text{OH})\text{C}_6\text{H}_4\text{N}(\text{CH}_3)_2$.

Properties: Colorless prisms; forms a colorless solution in ether or benzene and a blue solution in alcohol or acetic acid. Soluble in alcohol, ether, benzene, and acetic acid. M.p. 96°C . Combustible.

Derivation: Reaction of tetramethyldiaminodiphenylmethane, hydrochloric acid and glacial acetic acid; oxidized with lead peroxide.

Grade: Technical.

Containers: Fiber drums; tank trucks.

Uses: Dye intermediate; organic synthesis.

tetramethyldiaminobenzophenone (Michler's ketone)

$\text{CO}[\text{C}_6\text{H}_4\text{N}(\text{CH}_3)_2]_2$. (4,4'-bis(dimethylamino) benzophenone).

Properties: Crystalline leaflets; m.p. 172°C ; b.p., decomposes at 360°C ; soluble in alcohol, ether, and water. Combustible.

Derivation: From dimethylaniline by reaction with phosgene.

Containers: Barrels; fiber drums.

Use: Synthesis of dyestuffs, especially auramine derivatives.

tetramethyldiaminodiphenylmethane (tetra base)

$\text{H}_2\text{C}[\text{C}_6\text{H}_4\text{N}(\text{CH}_3)_2]_2$.

Properties: Yellowish leaflets or glistening plates; m.p. $90\text{--}91^\circ\text{C}$; sublimes with decomposition; b.p. 390°C ; insoluble in water; soluble in benzene, ether, carbon disulfide and acids.

Derivation: By heating dimethylaniline with hydrochloric acid and formaldehyde.

Use: Dye intermediate.

tetramethyldiaminodiphenylsulfone (4,4'-bis(dimethylamino)diphenylsulfone) $[(\text{CH}_3)_2\text{NC}_6\text{H}_4]_2\text{SO}_2$. Solid; m.p. $259\text{--}260^\circ\text{C}$. Combustible.

Grades: Technical; reagent.

Uses: Intermediate in making dyestuffs and medicinal chemicals; analytical reagent for lead.

tetramethylene. See cyclobutane.

tetramethylene bismethanesulfonate. See busulfan.

tetramethylenediamine $\text{H}_2\text{N}(\text{CH}_2)_4\text{NH}_2$.

Properties: Colorless crystals with strong odor; m.p. 27°C ; b.p. $158\text{--}159^\circ\text{C}$. Soluble in water with strongly basic reaction. Combustible.

Use: Chemical intermediate.

tetramethylene dichloride. See 1,4-dichlorobutane.

tetramethylene glycol. See 1,4-butylene glycol.

tetramethylene sulfone. See sulfolane.

1,1,4,4-tetramethyl-6-ethyl-7-acetyl-1,2,3,4-tetrahydro-

naphthalene $\text{C}_{18}\text{H}_{26}\text{O}$. A polycyclic musk.

Properties: Colorless crystals; m.p. 45°C ; b.p. (2 mm) 130°C ; insoluble in water; soluble in alcohol.

Uses: Perfumes; cosmetics; soaps.

tetramethylethylenediamine (TMEDA; N,N,N',N'-tetramethylethylenediamine)

$(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{N}(\text{CH}_3)_2$.

Properties: Colorless, liquid with slight ammoniacal odor. Soluble in water and most organic solvents. B.p. $121\text{--}122^\circ\text{C}$; sp. gr. 0.7765 ($20/4^\circ\text{C}$); refractive index ($n_{25/\text{D}}$) 1.4170; f.p. -55.1°C . Combustible.

Grade: Anhydrous.

Containers: Up to 55-gal steel drums.

Uses: Preparation of epoxy curing agents; polyurethane formation; corrosion inhibitor; textile finishing agents; intermediate for quaternary ammonium compounds.

tetramethylguanidine $(\text{CH}_3)_2\text{NC}(\text{NH})\text{N}(\text{CH}_3)_2$.

Properties: Liquid with slight ammoniacal odor; b.p. $159\text{--}160^\circ\text{C}$; soluble in both water and organic solvents. A strong base. Combustible.

Containers: Drums.

2,6,10,14-tetramethylhexadecane. See phytane.

tetramethyllead (TML) $(\text{CH}_3)_4\text{Pb}$.

Properties: Colorless liquid. Sp. gr. 1.995; f.p. -27.5°C ; b.p. 110°C (10 mm). Insoluble in water; slightly soluble in benzene, petroleum ether, alcohol. Flash point 100°F .

Derivation, grades, and containers: See tetraethyl lead. Methyl reagents used instead of ethyl.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Flammable, moderate fire risk. Tolerance

(as Pb), 0.15 mg. per cubic meter of air. Lower explosion level, 1.8%.

Uses: Antiknock agent in aviation gasoline.

Shipping regulations: (Air) Poison label. Not accepted on passenger planes.

See note under tetraethyllead.

tetramethylmethane. See neopentane.

N,N,N',N'-tetramethylmethylenediamine $(\text{CH}_3)_2\text{NCH}_2\text{N}(\text{CH}_3)_2$.

Properties: Liquid; refractive index 1.4005 (n 20/D).

3,3'-tetramethylnonyl thiodipropionate. See ditridecyl thiodipropionate.

tetramethylsilane $(\text{CH}_3)_4\text{Si}$.

Properties: Colorless volatile liquid. B.p. 26.5°C; sp. gr. 0.646 (20/4°C). Insoluble in water and cold, concentrated sulfuric acid; soluble in most organic solvents. Low toxicity. Flash pt. 0°F.

Derivation: By Grignard reaction of silicon tetrachloride and methylmagnesium chloride.

Grades: Technical; purified.

Containers: Bottles; 50-lb drums.

Hazard: Flammable; high fire risk.

Use: Aviation fuel; internal standard for NMR analytical instruments.

Shipping regulations: (Rail, Air) Flammable liquid, n.o.s., Flammable Liquid label.

tetramethylthiuram disulfide. See thiram.

tetramethylthiuram monosulfide (bisdimethylthiocarbonyl sulfide) $[(\text{CH}_3)_2\text{NCH}_2]_2\text{S}$.

Properties: Yellow powder; sp. gr. 1.40; m.p. 104–107°C; soluble in acetone, benzene, and ethylene dichloride; insoluble in water and gasoline. Combustible.

Hazard: Moderately toxic.

Uses: Ultra-accelerator for rubber; fungicide; insecticide.

"Tetramix."²⁸ Trademark for a liquid antiknock compound, the active component of which is a redistribution mixture of tetraethyl and tetramethyl lead. Several redistribution mixtures are made by changing the molar percentages of the different lead alkyls. These mixtures are identified by the molar percentage of the TML used in the reaction.

Hazard: See tetraethyl lead.

Containers: Drums; tank cars.

"Tetran."²⁴ Trademark for polytetrafluoroethylene (q.v.).

tetranitroaniline (TNA) $\text{C}_6\text{H}(\text{NO}_2)_4\text{NH}_2$. A nitration product of aniline which melts at 170°C and explodes at 237°C.

Hazard: Toxic. Dangerous fire and explosion risk.

Use: Manufacture of detonators and primers.

Shipping regulations: (Rail, Air) Consult regulations.

tetranitromethane $\text{C}(\text{NO}_2)_4$.

Properties: Colorless liquid. Pungent odor. B.p. 125.7°C; m.p. 12.5°C; sp. gr. (13°C) 1.650. Miscible with alcohol and ether; insoluble in water. Decomposed by alcoholic solution of potassium hydroxide. Powerful oxidizing agent.

Derivation: By action of fuming nitric acid on benzene, acetic anhydride, or acetylene.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Dangerous fire and explosion risk. Tolerance, 1 ppm in air.

Uses: Rocket fuel, as an oxidant or monopropellant; qualitative test for unsaturated compounds.

Shipping regulations: (Rail) Yellow label. (Air) Not acceptable.

"Tetranol."³⁰⁰ Trademark for a highly sulfated fatty ester of the oleic type, with wetting and dye-leveling properties.

tetra(octylene glycol) titanate. See octylene glycol titanate.

"Tetra-Phen."⁵¹¹ Trademark for a series of straight or modified phenolics, solid or liquid. Special resins for industrial use.

1,1,4,4-tetraphenylbutadiene (TPB)

$(\text{C}_6\text{H}_5)_2\text{C}:\text{CHCH}:\text{C}(\text{C}_6\text{H}_5)_2$.

Properties: White crystals; two forms, m.p. 194–196°C and m.p. 202–204°C; insoluble in water, soluble in most organic solvents. Combustible.

Grade: Purified.

Use: Primary fluor or wave length shifter in solution scintillators.

tetraphenylsilane $(\text{C}_6\text{H}_5)_4\text{Si}$.

Properties: White solid; m.p. 237°C; b.p. 428°C. Very stable and inert. Combustible.

Derivation: By Grignard reaction of silicon tetrachloride and phenylmagnesium chloride.

Grade: Technical.

Use: Heat-transfer medium; polymers.

tetraphenyltin $(\text{C}_6\text{H}_5)_4\text{Sn}$.

Properties: White powder. S. gr. 1.490; m.p. 225–228°C; b.p. above 420°C. Insoluble in water; soluble in hot benzene, toluene, xylene.

Derivation: Reaction of tin tetrachloride with phenylmagnesium bromide.

Hazard: Toxic; skin irritant. Tolerance, 0.1 mg per cubic meter of air.

Uses: Stabilizer in chlorinated transformer oils; moth-proofing agent; scavenger in dielectric fluids; intermediate.

tetraphosphoric acid. See polyphosphoric acids.

tetraphosphorus heptasulfide. See phosphorus heptasulfide.

tetraphosphorus hexasulfide. See phosphorus trisulfide.

tetraphosphorus trisulfide. See phosphorus sesquisulfide.

tetrapotassium EDTA. See ethylenediaminetetraacetic acid salts.

tetrapotassium ethylenediaminetetraacetate. See ethylenediaminetetraacetic acid (note).

tetrapotassium pyrophosphate (TKPP). See potassium pyrophosphate.

tetrapropenylsuccinic anhydride. See dodecenylsuccinic anhydride. Many isomers are possible.

tetra-n-propyl dithionopyrophosphate

$(\text{C}_3\text{H}_7\text{O})_2\text{P}(\text{S})\text{OP}(\text{S})(\text{OC}_3\text{H}_7)_2$.

Properties: Amber liquid; b.p. 148°C (2 mm). Miscible with most organic solvents; insoluble in water.

Hazard: Highly toxic.

Use: Insecticide; acaricide.

Shipping regulations: (Rail, Air) Organic phosphates, liquid, n.o.s., Poison label. Not accepted on passenger planes.

tetrapropylene (dodecene; propylene tetramer) $\text{C}_{12}\text{H}_{24}$. Mixture of C_{12} monoolefins.

Properties: Liquid; sp. gr. (20/20°C) 0.770; boiling range 183°–218°C; weight 6.44 lb/gal (60°F). Combustible.

Derivation: Olefin fraction obtained from catalytic polymerization of propylene.

Containers: Barges; tank cars.

Uses: Detergents (dodecylbenzene); lubricant additives; plasticizers.

tetrapropylthiuram disulfide $\{(\text{C}_3\text{H}_7)_2\text{NCS}\}_2\text{S}_2$.

Properties: Light cream color; sp. gr. (20/20°C) 1.13; melting range 49–51.5°C; musty odor. Soluble in carbon disulfide, benzene, chloroform and gasoline; insoluble in water and 10% caustic. Combustible.

"Tetraquinone."²²⁷ Trademark for 1,2,3,4-tetrahydro-6-methylquinoline (q.v.).

tetrasilane Si_4H_{10} .

Properties: Colorless liquid; f.p. –93.5°C; b.p. 109°C; sp. gr. 0.825 (0°C).

Hazard: Severe fire and explosion risk; can ignite or explode in air.

Shipping regulations: (Rail, Air) Consult authorities.

tetrasodium diphosphate. See sodium pyrophosphate and sodium polyphosphates.

tetrasodium EDTA (ethylenediaminetetraacetic acid, tetrasodium salt; EDTA Na_4) $\text{C}_{10}\text{H}_{12}\text{N}_2\text{Na}_4\text{O}_8$, anhydrous or $2\text{H}_2\text{O}$. White powder; freely soluble in water. Used as a general-purpose chelating agent.

See also ethylenediaminetetraacetic acid (note).

tetrasodium monopotassium tripolyphosphate

$\text{Na}_4\text{K}_3\text{P}_3\text{O}_{10}$.

Properties: White crystalline solid; m.p. 580–600°C; sp. gr. 2.55; solubility in water (26°C) 30 g/100 ml.

Use: Sequestrant.

tetrasodium pyrophosphate. See sodium pyrophosphate and sodium polyphosphate.

tetrastearyl titanate. Organic intermediate, adhesion promoter, pigment dispersant.

tetrazene (4-amidino-1-(nitrosamino-amidino)-1-tetrazene) $\text{H}_2\text{NC}(\text{NH})\text{NHNHN}(\text{NC}(\text{NH})\text{NHNHNO})$.

Properties: Colorless or pale yellow, fluffy solid; apparent density 0.45 but yields a pellet of density 1.05 under pressure of 3000 psi. Practically insoluble in water, alcohol, ether, benzene, and carbon tetrachloride. Slightly hygroscopic.

Derivation: Interaction of an aminoguanidine salt with sodium nitrite in absence of free mineral acid.

Use: Initiating explosive. Noncorrosive type.

Shipping regulations: (Rail) Consult regulations. Not accepted by express. (Air) Not acceptable.

tetrazolium chloride (tetrazolium salt; TTC; 2,4,5-triphenyltetrazolium chloride) $\text{CN}_4\text{Cl}(\text{C}_6\text{H}_5)_3$.

Properties: White to pale-yellow crystalline powder which darkens on exposure to light. Readily soluble in water. M.p. (with decomposition) 245°C.

Uses: In germination and viability tests. Viable parts of seed are stained red by deposition of red insoluble triphenyl formazan.

"Tetrine."⁷³ Trademark for a series of organic chelating, sequestering, and complexing agents consisting of ethylenediaminetetraacetic acid (EDTA) and its salts.

tetraodotoxin. A highly toxic venom occurring in puffer-like fish.

tetrol. See furan.

"Tetron."⁸⁸ Trademark for tetraethyl pyrophosphate (tepp), technical, and in liquid formulations for insecticidal use.

Hazard: Highly toxic.

"Tetrone" A.²⁸ Trademark for dipentamethylenethiuram tetrasulfide rubber accelerator.

"Tetronic."²⁰³ Trademark for a nonionic tetrafunctional series of polyether block-polymers ranging in physical form from liquids through pastes to flakable solids. They are polyoxyalkylene derivatives of ethylenediamine. Physical state varies with molecular weight and oxyethylene content; 100% active.

Uses: Low-foaming detergent formulations; defoaming agents; flexible and rigid polyurethane foams; emulsifying and demulsifying agents; textile processing.

"Tetrosan 3,4D."³²⁸ Trademark for alkylidimethyl 3,4-dichlorobenzylammonium chloride. Used as disinfectant, deodorant, germicide and fungicide.

tetryl (tetraltite; nitramine). Common commercial names for trinitrophenylmethylnitramine.

$(\text{NO}_2)_3\text{C}_6\text{H}_2\text{N}(\text{NO}_2)\text{CH}_3$.

Properties: Yellow crystals; m.p. 130–132°C; sp. gr. 1.57 (19°C); explodes at 187°C. Insoluble in water; soluble in alcohol, ether, benzene, glacial acetic acid.

Hazard: Dangerous fire and explosion risk; toxic; skin irritant. Tolerance, 1.5 mg per cubic meter of air.

Absorbed by skin.

Uses: Detonating agent for less sensitive high explosives.

Shipping regulations: (Rail) Consult regulations. Not accepted by express. (Air) Not acceptable.

"Texanol."²⁵⁶ Trademark for 2,2,4-trimethyl-1,3-pentanediol monoisobutyrate.

"Texicote."²⁶³ Trademark for a series of vinyl, acrylic and styrene polymer and copolymer emulsions, plasticized and unplasticized. Available in many grades.

Uses: Adhesives; paint; carpet backsize; pigment binder in clay coatings; self-polishing finishes.

"Texicryl."²⁶³ Trademark for a series of acrylic and methacrylic polymer and copolymer emulsions.

Uses: Paper coating, paint, leather finishes, textiles, adhesives, and wall paper.

"Texigel."²⁶³ Trademark for a series of polyacrylic thickening agents, water-soluble anionic colloids. Used as stabilizers, protective colloid and thickeners for natural and synthetic latices and other aqueous dispersions, binders, and flocculants.

"Texilac."²⁶³ Trademark for a series of vinyl and acrylic polymer and copolymer solutions in various solvents, plasticized and unplasticized.

Uses: Wet-bond and heat-seal adhesives, impregnants, specialty lacquers, paper coating, nitrocellulose finishes, and printing inks for plastic films.

"Texiprint."²⁶³ Trademark for a series of synthetic resin pigment pastes and thickeners for screen and roller printing on textiles.

textile assistant. See assistant.

textile auxiliary. See auxiliary.

textile oil. Any of various specially compounded oils used to condition raw fibers, yarns or fabric for manufacturing, bleaching, dyeing and finishing operations.

"Textiline."⁴⁹⁸ Trademark for a series of synthetic fiber lubricants based on nitrogen derivatives, esters and white mineral oils.

"Textolite."²⁴⁵ Trademark for laminated plastic sheets, tubes, and rods used as insulating materials. Includes laminations of various combinations of phenolic, melamine, silicone, and epoxy resins with such base materials as paper, asbestos, cotton, linen, and nylon. Also some of the above materials with copper foil cladding for printed circuit applications.

"Textone."⁸⁴ Trademark for a sodium chlorite preparation that bleaches fabrics (cotton, linen, rayon, nylon) to high whiteness without degradation.

textured protein. See *protein, textured*.

textryl. Generic name for nonwoven structures which may be manufactured by wet-processing from staple fibers and fibril binder.

"Texzyme."¹¹⁴ Trademark for a proteolytic enzyme which digests blood, albumin, food, beverage, urine, perspiration, etc. Used in silk and filament rayon fabric to accelerate the rate of desizing and insure good results in dyeing, bleaching, and finishing.

"T-Fatty Acids."⁴⁸⁷ Trademark for fatty acids derived from animal fats. T-10 is a completely hydrogenated tallow fatty acid. T-11 is a tallow fatty acid which has been partially hydrogenated by a special process designed to maximize reduction of polyunsaturated fatty acids. T-18, T-22, and T-33 are grades of distilled tallow and animal fatty acids.

Properties: White to yellow waxy solids which liquefy from about 43° to 64°C.

Containers: Tank cars and trucks.

Uses: Chemical intermediates, rubber compounding, grease manufacture, cosmetic ingredients, buffing compounds, candles, lubricants and emulsifiers.

TFE. Abbreviation for tetrafluoroethylene. See also *polytetrafluoroethylene*.

TFEO. Abbreviation for tetrafluoroethylene epoxide (q.v.).

TGA. Abbreviation for triglycollamic acid. See *nitri-lotriacetic acid*.

Th Symbol for thorium.

"Thalan."⁵⁸ Trademark for 98% phthalic anhydride (q.v.).

thallic oxide. See *thallium peroxide*.

thallium Tl Metallic element of atomic number 81, Group IIIA of the periodic table. Atomic weight 204.37; valences 1,3; 2 stable isotopes.

Properties: Bluish-white, lead-like solid. Sp. gr. 11.85; m.p. 302°C; b.p. 1457°C. Oxidizes in air at room temperature. Soluble in nitric and sulfuric acids; insoluble in water, but readily forms soluble compounds when exposed to air or water.

Derivation: Flue dusts from lead and zinc smelting. The thallium compounds recovered are treated to obtain the metal by electrolysis, precipitation, or reduction.

Grades: Technical; high-purity.

Containers: Glass bottles.

Hazard: Forms toxic compounds on contact with moisture; keep from skin contact. Tolerance (as Tl) for soluble salts, 0.1 mg per cubic meter of air.

Uses: Thallium salts; alloys; low-melting glasses; pesticides; photoelectric applications; electrodes in dissolved oxygen analyzers.

thallium acetate (thallous acetate) TlOOCOCH_3 .

Properties: White, deliquescent crystals. Soluble in water, alcohol.

Constants: M.p. 131°C; sp. gr. 3.68.

Derivation: Interaction of acetic acid and thallium carbonate.

Hazard: Toxic. See under thallium.

Uses: Medicine; high specific gravity solutions used to separate ore constituents by flotation.

Shipping regulations: (Rail, Air) Poison label.

thallium bromide (thallous bromide) TlBr .

Properties: Yellowish white, crystalline powder. Soluble in alcohol; slightly soluble in water; insoluble in acetone. Sp. gr. 7.557; b.p. 815°C; m.p. (approx) 460°C.

Hazard: Toxic. See under thallium.

Use: Mixed crystals with thallium iodide for infrared radiation transmitters used in military detection devices.

Shipping regulations: (Rail, Air) Poison label.

thallium carbonate (thallous carbonate) Tl_2CO_3 .

Properties: Heavy shiny, colorless or white crystals.

Highly refractive. Melts to dark gray mass. Slightly alkaline taste. Soluble in water; insoluble in alcohol. Sp. gr. 7; m.p. 272°C.

Hazard: Toxic. See under thallium.

Uses: Analysis (testing for carbon disulfide); artificial diamonds.

Shipping regulations: (Rail, Air) Poison label.

thallium chloride (thallous chloride) TlCl .

Properties: White, crystalline powder. Becomes violet on exposure to light. Slightly soluble in water; insoluble in alcohol, ammonium hydroxide. Sp. gr. 7.004 (30/4°C); m.p. 430°C; b.p. 720°C.

Containers: Bottles.

Hazard: Toxic. See under thallium.

Uses: Catalyst (chlorination); medicine; sun-tan lamps.

Shipping regulations: (Rail, Air) Poison label.

thallium hydroxide (thallous hydroxide) $\text{TlOH} \cdot \text{H}_2\text{O}$.

Properties: Yellow needles. Soluble in alcohol, water. B.p. (dehydrated) 139°C, decomposes.

Hazard: Toxic. See under thallium.

Use: Analysis (testing for ozone; indicator).

Shipping regulations: (Rail, Air) Poison label.

thallium iodide (thallous iodide) TlI .

Properties: Yellow powder. Insoluble in alcohol; slightly soluble in water; soluble in aqua regia. Sp. gr. 7.09; b.p. 824°C; m.p. 440°C. Becomes red at 170°C.

Hazard: Toxic. See under thallium.

Uses: Medicine; mixed crystals with thallium bromide for infrared radiation transmitters.

Shipping regulations: (Rail, Air) Poison label.

thallium-mercury alloy. Reported to have freezing point -60°C, about 20°C below that of mercury.

Hazard: Toxic. See under thallium.

Uses: Substitute for mercury in electrical switches, thermometers, etc. for extreme low-temperature service.

thallium monoxide (thallium oxide; thallous oxide) Tl_2O .

Properties: Black powder. Oxidizes when exposed to air. Keep well stoppered! Soluble in alcohol, water (decomposes). M.p. 300°C; b.p. 1080°C; sp. gr. 9.52 (16°C).

Hazard: Toxic. See under thallium.

Uses: Analysis (testing for ozone); artificial gem; optical glass of high refractive index.

Shipping regulations: (Rail, Air) Poison label.

thallium nitrate (thallous nitrate) TlNO_3 .

Properties: Colorless crystals. Soluble in hot water; insoluble in alcohol. Sp. gr. 5.5; m.p. 206°C (solidifies to a glass-like solid); decomposes at 450°C .

Grade: Technical.

Hazard: Highly toxic. Tolerance, 0.1 mg per cubic meter of air. Strong oxidizing agent. Fire and explosion risk.

Uses: Analysis; pyrotechnics; green fire.

Shipping regulations: (Rail, Air) Poison label.

thallium sesquichloride (thallo-thallic chloride)

$\text{TlCl}_3 \cdot 3\text{TlCl}$ or Tl_2Cl_5 .

Properties: Yellow, crystalline powder. Slightly soluble in water. Sp. gr. 5.9; m.p. $400\text{--}500^\circ\text{C}$.

Hazard: Toxic. See under thallium.

Shipping regulations: (Rail, Air) Poison label.

thallium sulfate (thallous sulfate) Tl_2SO_4 .

Properties: Colorless crystals. Soluble in water. Sp. gr. 6.77; m.p. 632°C .

Grades: Technical, 99%.

Hazard: Toxic. See under thallium.

Uses: Analysis (testing for iodine in the presence of chlorine); medicine; ozonometry; rodenticides; pesticide.

Shipping regulations: (Rail, Air) Poison label.

thallium sulfide (thallous sulfide) Tl_2S .

Properties: Blue-black, lustrous, microscopic crystals or amorphous powder. Soluble in mineral acids; insoluble in water, alcohol or ether. Sp. gr. 8.46; m.p. 448°C .

Hazard: Toxic. See under thallium.

Uses: Infrared-sensitive photocells.

Shipping regulations: (Rail, Air) Poison label.

thallous compound. See corresponding thallium compound.

THAM. See tris(hydroxymethyl)aminomethane.

"Thancat."¹³⁷ Trademark for a series of catalysts for use in urethane resins. The three letters that follow the trademark most nearly identify the chemical name. Some examples are:

DME. N,N-Dimethylethanolamine.

DMP. N,N'-Dimethylpiperazine.

NEM. N-Ethylmorpholine.

NMM. N-Methylmorpholine.

"Thanite."²⁶⁶ Trademark for a technical grade of isobornyl thiocyanacetate.

Use: Insecticide.

"Thanol."¹³⁷ Trademark for a series of polyols for use in polyurethane resins. "Thanol" is followed by letters denoting the broad use or composition, or by numbers indicating the molecular range.

thebaine (para-morphine) $\text{C}_{19}\text{H}_{21}\text{NO}_3$.

Properties: White, crystalline alkaloid. Slightly soluble in water; soluble in alcohol and ether. M.p. 193°C . Sp. gr. 1.30. It is non-addictive; extracted from poppies of a different species from morphine-producing opium poppies. It is a precursor of cocaine.

"THEIC."⁵⁰ Trademark for tris(2-hydroxyethyl) isocyanurate (q.v.).

theine. See caffeine.

Thenard's blue. See cobalt blue.

thenyl. The radical $\text{C}_4\text{H}_5\text{SCH}_2\text{—}$ or

based on methylthiophene.

thenyl alcohol (2-thienylmethanol; 2-hydroxymethylthiophene; 2-thiophenecarbinol). $\text{C}_4\text{H}_5\text{SCH}_2\text{OH}$.

Properties: Colorless liquid; b.p. 207°C ; insoluble in water; soluble in alcohol and ether.

Derivation: A heterocyclic alcohol made by reaction of 2-thienylmagnesium iodide and formaldehyde.

Uses: No commercially developed applications.

thenyldiamine. Coined name for 2-[2-dimethylaminoethyl]-3-thienylaminopyridine.

$(\text{C}_4\text{H}_5\text{SCH}_2)\text{N}(\text{C}_2\text{H}_5)_2\text{CH}_2\text{CH}_2\text{N}(\text{CH}_3)_2$.

Properties: Liquid; b.p. (1.0 mm) $169\text{--}172^\circ\text{C}$.

Derivation: Condensing N,N-dimethylaminoethyl-alpha-aminopyridine with 3-thenyl bromide.

Uses: Medicine (as base for various salts, especially the hydrochloride).

theobroma oil (cacao butter; cocoa butter).

Properties: Yellowish-white solid with chocolate-like taste and odor. Sp. gr. $0.858\text{--}0.864$ ($100/25^\circ\text{C}$); m.p. $30\text{--}35^\circ\text{C}$; refractive index (n $40/D$) $1.4537\text{--}1.4585$; saponification number $188\text{--}195$; iodine number $35\text{--}43$. Insoluble in water; slightly soluble in alcohol; soluble in boiling dehydrated alcohol; freely soluble in ether and chloroform. Combustible. Low toxicity.

Derivation: From the cacao bean, by expression, decoction, or extraction by solvent.

Chief constituents: Glycerides of stearic, palmitic, and lauric acids.

Grades: Crude; refined; U.S.P.

Containers: Tins; drums.

Uses: Confectionery; suppositories and pharmaceuticals; soaps; cosmetics.

theobromine (3,7-dimethylxanthine) $\text{C}_7\text{H}_8\text{N}_4\text{O}_2$. The alkaloid found in cocoa and chocolate products. A purine base closely related to caffeine. Also occurs in tea and cola nuts.

Hazard: Toxic by ingestion.

theophylline (1,3-dimethylxanthine) $\text{C}_7\text{H}_8\text{N}_4$ · H_2O .

Properties: White, crystalline alkaloid; odorless; bitter taste; m.p. $270\text{--}274^\circ\text{C}$; slightly soluble in water and alcohol; more soluble in hot water; soluble in alkaline solutions.

Derivation: (a) By extraction from tea leaves; (b) synthetically from ethyl cyanoacetate.

Grades: Technical; N.F.

Containers: Glass bottles; 1-, 5-lb tins; 25-, 100-lb drums.

Use: Medicine.

theoretical plate. See HETP.

therm. A unit of heat equal to 100,000 Btu. It has also been used to mean 1 Btu or 1 small calorie, but these uses have been abandoned in the U.S.

thermal black. Carbon black made from natural gas by the thermatomic process (q.v.). Production by pyrolysis of bituminous coal is an alternative method.

Grades: Fine thermal black (FT); medium thermal black (MT).

Hazard: Dust may be fire risk.

Uses: Rubber compounding; reclaimed rubber; pigment. See also furnace black.

thermal cracking. See cracking.

thermal decomposition See decomposition (2); pyrolysis.

thermal expansion coefficient. The change in volume per unit volume per degree change in temperature

(cubical coefficient). For isotropic solids the expansion is equal in all directions; and the cubical coefficient is approximately three times the linear coefficient of expansion. These coefficients vary with temperature, but for gases at constant pressure the coefficient of volume expansion is nearly constant and equals 0.00367 for 1°C at any temperature.

thermal neutron. A slow neutron. See neutron.

thermal pollution. Heat introduced into rivers or estuaries by power plants or other industrial cooling waters or chemical wastes, which has adverse effects on estuarine ecology. See also water pollution.

"Therma-Tite."¹⁷⁰ Trademark for a specially formulated adhesive for high-speed bottle label machines to withstand the dangers of thermoshock. Material will adhere to cold glass without crystallizing.

thermatonic process. Methane or natural gas is cracked over hot bricks at a temperature of 1600°F to form amorphous carbon (carbon black) and hydrogen. See thermal black; carbon black.

"Thermax."⁶⁹ Trademark for a medium thermal carbon black used for compounding with rubber.

"Therminol" FR.⁵⁸ Trademark for heat-transfer liquids which are thermally and oxidatively stable to 600°F and extremely fire-resistant.

thermite. A mixture of ferric oxide and powdered aluminum, usually enclosed in a metal cylinder and used as an incendiary bomb invented by a German chemist Hans Goldschmidt about 1900. On ignition by a ribbon of magnesium, the reaction produces a temperature of about 4000°F, which is sufficient to soften steel. This is typical of some oxide/metal reactions which provide their own oxygen supply and thus are very difficult to stop.

Hazard: Dangerous fire risk.

Shipping regulations: (Rail, Air) Consult authorities.

thermochemistry. That branch of chemistry comprising the measurement and interpretation of heat changes that accompany changes of state and chemical reactions. It is closely related to chemical thermodynamics (q.v.). The heat of formation of a compound is the heat absorbed when it is formed from its elements in their standard states. An exothermic reaction evolves heat; an endothermic reaction requires heat for initiation. Application of thermochemical principles to generation of hydrogen by water splitting is a future possibility.

thermodynamics. A rigorously mathematical analysis of energy relationships (heat, work, temperature, and equilibrium) the principles of which were first elaborated by J. Willard Gibbs (q.v.) in the mid-19th century. It describes systems whose states are determined by thermal parameters, such as temperature, in addition to mechanical and electromagnetic parameters. A *system* is a geometric section of the universe whose boundaries may be fixed or varied, and which may contain matter or energy or both. The *state* of a system is a reproducible condition, defined by assigning fixed numerical values to the measurable attributes of the system. These attributes may be wholly reproduced as soon as a fraction of them have been reproduced. In this case the fractional number of attributes determines the state, and is referred to as the *number of variables of state* or the *number of degrees of freedom* of the system.

The concept of *temperature* can be evolved as soon as a means is available for determining when a body is "hotter" or "colder." Such means might involve the measurement of a physical parameter such as the volume of a given mass of the body. When a "hotter" body, A, is placed in contact with a "colder" body, B, it is observed that A becomes "colder" and B "hotter." When no further changes occur, and the joint system involving the two bodies has come to equilibrium, the two bodies are said to have the same temperature. Thus temperature can only be measured at equilibrium. Therefore thermodynamics is a science of equilibrium, and a thermodynamic state is necessarily an equilibrium state. Thermodynamics is a macroscopic discipline, dealing only with the properties of matter and energy in bulk, and does not recognize atomic and molecular structure. Although severely limited in this respect, it has the advantage of being completely insensitive to any change in our ideas concerning molecular phenomena, so that its laws have broad and permanent generality. Its chief service is to provide mathematical relations between the measurable parameters of a system in equilibrium so that, for example, a variable like pressure may be computed when the temperature is known, and *vice versa*.

The three laws of thermodynamics involve concepts too involved to be described here. For a more detailed explanation, see the article by Howard Reiss in "Encyclopedia of Chemistry", from which this entry was adapted.

thermodynamics, chemical. See chemical thermodynamics.

thermoelectricity. Electricity produced directly by applying a temperature difference to various parts of electrically conducting or semiconducting materials. Usually two dissimilar materials are used, and the points of contact are kept at different temperatures (Peltier effect). Many temperature-measuring devices (thermocouples, thermopiles) work on this principle, since the voltage is proportional to the temperature difference. Metallic conductors are usually used for these "thermometers," which produce a rather small current. A newer use for the effect is as a source of electrical energy, i.e., a means of direct conversion of heat into electricity (or vice versa) without the use of a generator (or motor). The materials used for these thermoelectric couples are semiconductors (e.g., tellurium; zinc antimonide; lead, bismuth, and germanium tellurides; samarium sulfide) or thermoelectric alloys, all of which produce relatively large currents. Several of these "cells" are then hooked in series much like the cells of a battery.

"Thermoflex" A.²⁸ Trademark for a rubber antioxidant containing 25% di-para-methoxydiphenylamine ($\text{CH}_3\text{OC}_6\text{H}_4$)₂NH, 25% diphenyl-para-phenylenediamine $\text{C}_6\text{H}_4(\text{NHC}_6\text{H}_5)_2$, and 50% phenyl-beta-naphthylamine $\text{C}_{10}\text{H}_7\text{NHC}_6\text{H}_5$.

Properties: Dark gray pellets; sp. gr. 1.21; f.p. not lower than 67°C.

Uses: Tire carcasses, transmission belts, etc., to promote resistance to flexing at operating temperatures. See also antioxidant.

thermoform. A heat-transfer medium. See coolant.

thermoforming. (1) See reforming. (2) Forming or shaping a thermoplastic sheet by heating the sheet above its melting point, fitting it along the contours of a mold with pressure supplied by vacuum or other force, and

removing it from the mold after cooling below its softening point. The method is applied to polystyrenes, acrylics, vinyls, polyolefins, celluloses, etc.

Thermofor process. Catalytic cracking process in which petroleum vapor is passed up through a reactor countercurrent to a flow of small beads of catalyst. The deactivated catalyst then passes through a regenerator and is recirculated.

"Thermoguard."^{28K} Trademark for antimony-based materials for incorporation in PVC and other chlorine-containing plastics for flameproofing properties.

"Thermolastic."¹²⁵ Trademark for a copolymer of butadiene and styrene which does not require vulcanization. Has the elastic and resilient properties of rubber while offering the techniques of thermoplastic processing. The desired end product may be formed by thermoplastic injection molding, extrusion, blow molding, or vacuum forming.

"Thermolite."^{28K} Trademark for a series of stabilizers for vinyl resins.

thermonuclear reaction. A nuclear fusion reaction initiated by a temperature in the neighborhood of 15 million degrees Kelvin, which can be attained in practice only by means of a fission reaction, and experimentally (on a minute scale) by high energy input from a laser. This phenomenon, which on the sun releases in one second energy equivalent to about 10^{11} megatons of TNT, occurs in a hydrogen bomb explosion in less than a millionth of a second. The problem of maintaining and controlling this energy release in a useful manner, as has been done successfully with fission, is of almost inconceivable magnitude. A controlled thermonuclear reactor would have to operate electromagnetically at temperatures of 10 million degrees Kelvin, far higher than any known materials can endure. Fuels would be elements from hydrogen through lithium (hydrogen and its isotopes, deuterium and tritium, helium and lithium-7), irradiated by laser or electron-beam pulses. Intensive research is under way, in view of the importance of this reaction as a possible future energy source. See also nuclear reaction; fusion.

thermoplastic. A high polymer that softens when exposed to heat and returns to its original condition when cooled to room temperature. Natural substances that exhibit this behavior are crude rubber and a number of waxes; however, the term is usually applied to synthetics such as polyvinyl chloride, nylons, fluorocarbons, linear polyethylene, polyurethane prepolymer, polystyrene, polypropylene, and cellulosic and acrylic resins. See also thermoset.

thermoset. A high polymer that solidifies or "sets" irreversibly when heated. This property is usually associated with a cross-linking reaction of the molecular constituents induced by heat or radiation, as with proteins, and in the baking of doughs. In many cases, it is necessary to add "curing" agents such as organic peroxides or (in the case of rubber) sulfur. For example, linear polyethylene can be cross-linked to a thermosetting material either by radiation or by chemical reaction. Phenolics, alkyds, amino resins, polyesters, epoxides, and silicones are usually considered to be thermosetting; but the term also applies to materials where additive-induced cross-linking is possible, e.g., natural rubber.

THF. Abbreviation for tetrahydrofuran (q.v.).

"THFA."²²⁴ Trademark for tetrahydrofurfuryl alcohol (q.v.).

thia- Prefix indicating the presence of sulfur in a heterocyclic ring.

"Thiacryl."²⁷ Trademark for millable polyacrylate base synthetic rubbers.

Uses: Seals, gaskets, O-rings for automotive power train components and hydraulic assemblies; also hose, belting.

thiamine (vitamin B₁) C₁₂H₁₇ClN₄OS. 3-(4-Amino-2-methylpyrimidyl-5-methyl)-4-methyl-5, beta-hydroxyethylthiazolium chloride. The antineuritic vitamin, essential for growth and the prevention of beriberi. It functions in intermediate carbohydrate metabolism in coenzyme form in the decarboxylation of alpha-keto acids. Deficiency symptoms: emotional hypersensitivity, loss of appetite, susceptibility to fatigue, muscular weakness and polyneuritis.

Sources: Enriched and whole grain cereals, milk, legumes, meats, yeast. Most of the thiamine commercially available is synthetic.

Uses: Medicine; nutrition; enriched flours. Isolated usually as the chloride (see formula above). Available as thiamine hydrochloride and thiamine mononitrate.

"Thiate."⁶⁹ Trademark for a series of accelerators for neoprene.

"Thiate A." (thiohydropyrimidine).

Properties: White crystalline powder; sp. gr. $1.12 \pm .03$; melts at 250°C min; moderately soluble in chloroform, ethyl alcohol; insoluble in water, dilute caustic, carbon disulfide, gasoline, benzene. Used for neoprenes to be cured in open steam. Used alone or with thiurams or guanidines plus sulfur.

"Thiate B." (trialkyl thiourea).

Properties: Reddish brown liquid; sp. gr. $1.05 \pm .12$; very soluble in benzene, carbon disulfide, chloroform, acetone, ethyl alcohol; soluble in water; insoluble in dilute caustic, gasoline. Used where low compression set is required.

"Thiate E." (trimethyl thiourea).

Properties: Light tan flakes; sp. gr. $1.23 \pm .03$; melting range 68–78°C; very soluble in water; soluble in toluene; insoluble in petroleum ether. Used where low compression set is required.

1,4-thiazane CH₂SCH₂CH₂NHCH₂.

Properties: Colorless liquid. Pyridine-like odor. Fumes in air. Absorbs carbon dioxide from the air. Soluble in alcohol, benzene, ether, water. S.p. 169°C (758 mm). combustible.

Derivation: Interaction of alcoholic ammonia and dichlorodiethyl sulfide.

Grade: Technical.

Use: Organic synthesis.

thiazole SCH:NCH:CH.

Properties: Colorless or pale yellow liquid; sp. gr. 1.198; b.p. 116.8°C; soluble in alcohol and ether; slightly soluble in water; odor resembles that of pyridine.

Uses: Organic synthesis of fungicides, dyes, and rubber accelerators.

thiazole dye. A dye whose molecular structure contains the thiazole ring (see thiazole). The chromophore groups are =C=N–, –S–C=, but the conjugated double bonds are also of importance. The members of the class are mainly used as direct or developed dyes for cotton, though some find use as union dyes. One example is primuline, CI No. 49000.

2-thiazylamine. See 2-aminothiazole.

"Thibenzole."¹²¹ Trademark for thiabendazole, a veterinary anthelmintic.

"Thibetolide."²²⁷ Trademark for pentadecanolide (q.v.).

thickening agent. Any of a variety of substances used to increase the viscosity of liquid mixtures and solutions and to aid in maintaining stability by their emulsifying properties. Four classifications are recognized: (1) starches, gums, casein, gelatin and phycocolloids, (2) semisynthetic cellulose derivatives (carboxymethyl-cellulose, etc.), (3) polyvinyl alcohol and carboxy-vinylates (synthetic), and (4) bentonite, silicates and colloidal silica. The first group is widely used in the food industries, especially in ice creams, confectionery, gravies, etc.; other major consumers are the paper, adhesives, textiles, and detergent fields. See also emulsion.

thimerosal (sodium ethylmercurithiosalicylate; ethylmercurithiosalicylic acid, sodium salt)
 $\text{NaOOC}_6\text{H}_4\text{SHgC}_2\text{H}_5$.

Properties: Light cream-colored crystalline powder with slight characteristic odor. pH (1% solution) about 6.7. Affected by light. Soluble in water and alcohol; almost insoluble in ether and benzene.

Derivation: Reaction between ethylmercuric chloride and thiosalicylic acid in alcoholic sodium hydroxide. Grade: N.F.

Hazard: Toxic by ingestion.

Uses: Medicine; bacteriostat, fungistat.

"Thimet."⁵⁷ See phorate.

thin. A nontechnical word used by scientists, with a variety of meanings. (1) In electronic metallurgy, a thin film is a vapor-deposited coating having a thickness of only a single atom; such *monatomic* films, e.g., thorium on tungsten, are used in electronic devices such as cathodes. (2) A coating or film of a fatty acid on water which is one molecule thick (about 200 angstroms) is called a *monomolecular* film. (3) In thin-layer chromatography the term applies to a specially prepared mixture of adsorbents spread on a glass slide to a thickness of about 1/100 inch. (4) The word is also used in the sense of a liquid of low viscosity, as in paint thinner and thin-boiling starch.

thin-boiling starch. See starch, modified; thin.

thin film. In electronic engineering, a film having a "thickness" of a single atom and consisting of a metal deposited on a metallic substrate either externally by vapor deposition or internally by diffusion. The base metal is usually tungsten (for a cathode), the film being any of a number of other metals (thorium, cesium, zirconium, barium, or cerium). "The greatest benefit is obtained when the films are of a monatomic nature; in the case of thorium on tungsten, the optimum coverage is 0.67 monatomic layer, i.e., the thorium atoms do not completely cover the tungsten surface. Such films are very tightly bound to the base metal by atomic forces." (W.H. Kohl). See also thin; film.

thin-layer chromatography (TLC). A micro type of chromatography (q.v.). The thin layer (about 0.01 inch) is the adsorbent, usually a special silica gel spread on glass, or incorporated in a plastic film. Single drops of the solutions to be investigated are placed along one edge of the glass plate, and this edge then dipped into a solvent. The solvent carries the constituents of the original test drops up the thin layer in a selective separation, so that a comparison with known standards, and various identifying tests may be made on the spots formed. See also thin.

thinner. A hydrocarbon (naphtha) or oleoresinous solvent (turpentine) used to reduce the viscosity of paints to appropriate working consistency usually just prior to application. In this sense a thinner is a liquid diluent, except that it has active solvent power on the dissolved resin.

thio-. A prefix used in chemical nomenclature to indicate the presence of sulfur in a compound, usually as a substitute for oxygen. See also thiol.

thioacetamide CH_3CSNH_2 .

Properties: Colorless leaflets; stable in solution; m.p. 115°C; soluble in water, alcohol, ether, benzene. Combustible.

Hazard: Moderately toxic by ingestion and inhalation. Use: To replace gaseous hydrogen sulfide in qualitative analysis.

thioacetic acid (thiacetic acid; ethanethiolic acid)
 CH_3COSH .

Properties: Clear yellow liquid; strong, unpleasant odor; sp. gr. 1.05 (25°C); f.p. -17°C; b.p. 81.8°C (630 mm); soluble in water, alcohol and ether. Combustible.

Derivation: By heating glacial acetic acid and phosphorus pentasulfide, with subsequent distillation.

Hazard: Moderately toxic by ingestion and inhalation. Uses: Chemical reagent; lachrymator.

thioallyl ether. See allyl sulfide.

thioanisole $\text{C}_6\text{H}_5\text{SCH}_3$.

Properties: Colorless liquid with strong, unpleasant odor; sp. gr. 1.053 (25°C); f.p. -15.5°C; b.p. 188°C; refractive index 1.5842 (n 25/D). Insoluble in water; soluble in most organic solvents. Combustible. Uses: Intermediate; solvent for polymeric systems.

thiobenzoic acid $\text{C}_6\text{H}_5\text{COSH}$.

Properties: Yellow oil or crystals. Sp. gr. (20/4°C) 1.1825-1.1835; m.p. 24°C; b.p. 77.5°C (5 mm), 122°C (30 mm); refractive index (n 20/D) 1.602-1.604. Insoluble in water; miscible in all proportions with organic solvents. Combustible.

Grade: 95% min.

Uses: Organic intermediate; in zinc thiobenzoate.

4,4'-thiobis(6-tert-butyl-meta-cresol).

Properties: Light gray to tan powder; m.p. 150°C min; sp. gr. 1.10 (25°C).

Uses: Protection of light-colored rubber from oxidation and of non-staining neoprene compounds against deterioration.

2,2'-thiobis(chlorophenol) $[\text{ClC}_6\text{H}_3(\text{OH})_2]_2\text{S}$.

Properties: White crystalline solid; m.p. 175.8-186.8°C; odorless; insoluble in water.

Hazard: May be toxic by ingestion.

Uses: Bacteriostat for cosmetics; fungicide.

2,2'-thiobis(4,6-di-sec-amyphenol) (2,2'-thiobis[4,6-bis-(1-methylbutyl)phenyl])

$[(\text{CH}_3[\text{CH}_2]_2\text{CH}(\text{CH}_3)_2\text{OHC}_6\text{H}_2)_2]_2\text{S}$. A dark viscous liquid; softening point 0°C; sp. gr. 0.99 (50°C).

Uses: Rubber antioxidant.

thiocarbamide. See thiourea.

thiocarbanil. See phenyl mustard oil.

thiocarbanilide (N,N'-diphenylthiourea; sulfocarbanilide) $\text{CS}(\text{NHC}_6\text{H}_5)_2$.

Properties: Gray powder; m.p. 148°C; sp. gr. 1.32. Soluble in alcohol and ether; insoluble in water. Combustible. Low toxicity.

Derivation: Interaction of aniline and carbon disulfide and alcohol in the presence of sulfur.

Containers: Bags; drums; carlots.

Uses: Intermediates; dyes (sulfur colors, indigo, methyl indigo); vulcanization accelerator; synthetic organic pharmaceuticals; flotation agent; acid inhibitor.

thiocarbonyl chloride. See thiophosgene.

thioctic acid. See dl-alpha-lipoic acid.

thiodiethylene glycol. See thiodiglycol.

thiodiglycol (thioidethylene glycol; beta-bis-hydroxyethyl sulfide; dihydroxyethyl sulfide) $(\text{CH}_2\text{CH}_2\text{OH})_2\text{S}$.

Properties: Syrupy colorless liquid. Characteristic odor. Sp. gr. 1.1852 at 20°C; b.p. 283°C; freezing point -10°C; viscosity 0.652 poise (20°C); flash point 320°F; weight per gallon 9.85 lbs; refractive index (20/D) 1.5217. Soluble in acetone, alcohol, chloroform, water; slightly soluble in benzene, carbon tetrachloride, and ether. Combustible. Low toxicity.

Derivation: Hydrolysis of dichloroethyl sulfide; interaction of ethylene chlorohydrin and sodium sulfide.

Containers: Cans; drums; tank cars.

Hazard: Do not use with hydrochloric acid.

Uses: Organic synthesis; solvent for dyes in textile printing; antioxidant.

thiodiglycolic acid $\text{HOOCCH}_2\text{SCH}_2\text{COOH}$. A dicarboxylic acid. Colorless crystals; m.p. 128°C. Soluble in water and alcohol. Combustible.

Hazard: Moderately toxic.

Uses: Analytical reagent.

4,4-thiodiphenol (TDP) $(\text{C}_6\text{H}_5\text{OH})_2\text{S}$.

Uses: Engineering plastics; antioxidant, flame retardant intermediate.

thiodiphenylamine. See phenothiazine.

thiodipropionic acid $\text{HOOCCH}_2 \cdot \text{S} \cdot \text{CH}_2\text{CH}_2\text{COOH}$. A dicarboxylic acid.

Uses: Preservative and antioxidant for edible fats and oils; pharmaceuticals; food packaging ingredient.

Hazard: Use in foods restricted to 0.02% of fat and oil content, including essential oils.

beta,beta-thiodipropionitrile $\text{S}(\text{CH}_2\text{CH}_2\text{CN})_2$.

Properties: White crystals or light yellow liquid; sp. gr. (30°C) 1.1095; m.p. 28.65°C; slightly soluble in water and alcohol; soluble in acetone, chloroform and benzene.

Hazard: May be toxic.

Uses: Preservative; selective solvent; chromatography.

thio-1,3-dithio[4,5-b]quinoxaline. See thioquinox.

thioethanolamine. See 2-aminoethanethiol.

"Thiofast."⁴³⁸ Trademark for a thio-indigo deep maroon pigment with a red-violet undertone. Used in paints, printing inks, and plastics.

"Thiofide."⁵⁸ Trademark for 2-2'-dithiobis(benzothiazole) (q.v.).

thioflavine T $\text{CH}_3\text{C}_6\text{H}_3\text{N}(\text{HCl})\text{SCC}_6\text{H}_4\text{N}(\text{CH}_3)_2$.

Properties: A yellow basic dye of the thiazole class. CI No. 49005. Fluoresces yellow to yellowish green when excited by ultraviolet.

Derivation: By heating para-toluidine with sulfur in the presence of lead oxide.

Uses: Textile dyeing; fluorescent sign paints; in combination with green or blue pigments to produce brilliant greens; phosphotungstic pigments.

thiofuran. See thiophene.

"Thiogel."⁹¹ Trademark for gelatin into which thiol or -SH groups have been introduced by an improved thiolation process.

Uses: Vehicle for gradual release of active compounds; enzyme activity measurement; tissue culture medium; photography and graphic arts; gel filtration; surface coatings.

1-thioglycerol $\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{SH}$.

Properties: Water-white liquid; b.p. 118°C at 5 mm; sp. gr. 1.295 (14.4°C). Soluble in water, alcohol and ether. Combustible; low toxicity.

Uses: Reducing agent for cystine molecule in human hair and wool; for stabilization of acrylonitrile polymers; medicine.

thioglycolic acid (mercaptoacetic acid) HSCH_2COOH .

Properties: Colorless liquid; strong, unpleasant odor; sp. gr. 1.325; f.p. -16.5°C; b.p. 105°C. Miscible with water, alcohol or ether. Combustible.

Derivation: Heating chloroacetic acid with potassium hydrogen sulfide.

Containers: Carboys; drums.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue.

Uses: Reagent for iron; manufacture of thioglycolates, permanent wave solutions and depilatories; vinyl stabilizer; manufacture of pharmaceuticals.

Shipping regulations: (Rail) Corrosive liquids, n.o.s., (Air) White label. Corrosive label.

2-thiohydantoin (glycolylthiourea)

NHC(S)NHC(O)CH_2 .

Properties: Crystals or tan powder. M.p. 230°C. Slightly soluble in water; insoluble in alcohols and ethers.

Purity: 99% min.

Use: Intermediate for pharmaceuticals, rubber accelerators, copper plating brighteners and dyestuffs.

2-thio-4-keto-thiazolidine. See rhodanine.

"Thiokol."²⁷ Trademark for a series of polysulfide elastomers in the form of liquids, water dispersions and millable (dry) rubbers. Combustible. Characterized by almost 100% resistance to solvents, particularly hydrocarbons, but has relatively low tensile strength.

Uses: Sealants for gasoline tanks; sealer adhesive for machine components; potting and sealing electrical parts; caulking ship decks and buildings; flexibilizing constituent of resin-based adhesives; paint spray and gasoline hose; oil suction and discharge hose; rocket propellant binder.

thiol (mercaptan). Any of a group of organic compounds resembling alcohols, but having the oxygen of the hydroxyl group replaced by sulfur, as in ethanethiol $(\text{C}_2\text{H}_5\text{SH})$. Many thiols are characterized by strong and repulsive odors.

Hazard: Aliphatic thiols are flammable and toxic by inhalation.

Uses: Warning agents in fuel gas lines; chemical intermediates. See also specific compound.

Shipping regulations: (Mercaptan mixtures, aliphatic) (Rail) Red label. (Air) Flammable Liquid label.

Note: Adoption of the name "thiol" to replace "mercaptan" has been officially recommended as being more consistent with the molecular constitution of these compounds. The older term, which literally means "mercury-seizing", is inappropriate.

thiomalic acid (mercaptosuccinic acid)

$\text{HOOCCH}(\text{SH})\text{CH}_2\text{COOH}$.

Properties: White crystals or powder; sulfuric odor; m.p. 149-150°C; soluble in water, alcohol, acetone,

and ether; slightly soluble in benzene. Low toxicity; combustible.

Use: Biochemical research; intermediate; rust inhibitor; antidarkening agent for crepe rubber; tackifier for synthetic rubber.

thionazin. Generic name for O,O-diethyl O-2-pyrazinyl phosphorothioate

$\text{NCHCHNCHCOPS}(\text{C}_2\text{H}_5\text{O})_2$.

Properties: Amber liquid; m.p. -1.7°C ; b.p. 80°C (0.01 mm). Slightly soluble in water; miscible with most organic solvents.

Hazard: Toxic by ingestion, inhalation and skin absorption. Cholinesterase inhibitor.

Uses: Insecticide; fungicide; nematocide.

Shipping regulations: (Rail, Air) Organic phosphates, liquid, n.o.s. Poison label. Not accepted on passenger planes.

"Thionex."²⁸ Trademark for tetramethylthiuram monosulfide. $[(\text{CH}_3)_2\text{NCH}]_2\text{S}$.

Properties: Lemon yellow powder or grains; sp. gr. 1.39; m.p. not lower than 105°C .

Use: Ultra-accelerator for rubber.

See also "Monex."

"Thionone."²³² Trademark for a series of sulfur dye-stuffs.

thionyl chloride (sulfurous oxychloride; sulfur oxychloride) SOCl_2 .

Properties: Pale yellow to red liquid with sharp odor; sp. gr. 1.638; f.p. -105°C ; b.p. 79°C ; decomposes at 140°C . decomposes (fumes) in water; soluble in benzene.

Grades: 93%, 97.5%.

Containers: Glass carboys; drums.

Hazard: Toxic; strong irritant to skin and tissue. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Pesticides; engineering plastics; chlorinating agent; catalyst.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

2-thio-4-oxypyrimidine. See thiouracil.

thiopental sodium ("Pentothal"; "Sodium Pentothal"). A rapidly acting barbiturate administered intravenously for general anesthesia and hypnosis. Commonly known as "truth serum". Its chemical name is sodium 5-ethyl-5(1-methylbutyl)-2-thiobarbiturate ($\text{C}_{11}\text{H}_{17}\text{N}_2\text{O}_2\text{SNa}$). May cause respiratory failure; should be used only with physician in attendance.

thiophane. See tetrahydrothiophene.

thiophene (thiofuran) CHCHCHCHS . A cyclic organosulfur; highly reactive.

Properties: Colorless liquid; refractive index (n 20/D) 1.5285; sp. gr. 1.0644 ($20^\circ/4^\circ\text{C}$); f.p. -38.5°C ; b.p. 84°C ; flash point 30°F . Soluble in alcohol and ether; insoluble in water.

Derivation: From coal tar (benzene fraction) and petroleum; synthetically from heating sodium succinate with phosphorus trisulfide.

Hazard: Flammable, dangerous fire risk. Moderately toxic.

Use: Organic synthesis (condenses with phenol and formaldehyde; copolymerizes with maleic anhydride).

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

alpha-thiophenealdehyde $\text{C}_4\text{H}_3\text{SCHO}$. (2-Thiophene-carboxaldehyde).

Properties: Oily liquid with almond-like odor; b.p. 198°C , 90°C (20 mm); sp. gr. 1.210–1.220; very soluble in alcohol, benzene, ether; slightly soluble in water. Combustible.

Grade: 95%.

Containers: Drums.

Uses: Thiophene derivatives; introducing thenyl group into organic compounds.

thiophenol (phenyl mercaptan) $\text{C}_6\text{H}_5\text{SH}$.

Properties: Water-white liquid, repulsive odor; b.p. 168.3°C ; b.p. (15 mm) 71°C ; refractive index 1.5891; sp. gr. (25/25°C) 1.075; insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Reduction of benzenesulfonyl chloride with zinc dust in sulfuric acid.

Grade: 99%.

Hazard: Skin irritant, moderately toxic.

Uses: Pharmaceutical synthesis.

"Thiophos."⁵⁷ Trademark for parathion, technical (q.v.).

thiophosgene (thiocarbonyl chloride) CSCl_2 .

Properties: Reddish liquid; sp. gr. 1.5085 (15°C); b.p. 73.5°C . Decomposes in water and alcohol. Soluble in ether.

Hazard: Highly toxic by ingestion and inhalation.

Use: Organic synthesis.

Shipping regulations: (Rail, Air) Poison label. Not acceptable on passenger planes.

thiophosphoryl chloride PSCl_3 .

Properties: Colorless liquid; penetrating odor; sp. gr. 1.635; b.p. 126°C ; f.p. -35°C ; decomposed by water; soluble in carbon disulfide, carbon tetrachloride. Flash point, none. Nonflammable.

Hazard: Highly toxic; strong irritant to skin and tissue.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

thioquinox. Generic name for 2,3-quinoxalinedithiol cyclic trithiocarbonate. $\text{C}_6\text{H}_4\text{N}_2\text{C}_2\text{S}_2\text{CS}$ (tricyclic).

Properties: Yellow solid; m.p. 180°C . Insoluble in water. Slightly soluble in acetone, kerosine and alcohol.

Hazard: Toxic by ingestion.

thioridazine (USAN) $\text{C}_{21}\text{H}_{26}\text{N}_2\text{S}_2$. 2-Methylthio-10-[2-(N-methyl-2-piperidyl)-ethyl]phenothiazine.

Properties: Colorless crystals; m.p. 158°C ; soluble in water and alcohol.

Grade: N.D. (as the hydrochloride).

Use: Medicine.

thiosalicylic acid (2-mercaptobenzoic acid)

$\text{HOCC}_6\text{H}_4\text{SH}$.

Properties: Yellow solid; m.p. $164\text{--}165^\circ\text{C}$; sublimes; slightly soluble in hot water; soluble in alcohol, ether and acetic acid. Combustible.

Grades: Reagent; technical, 80%; pharmaceutical.

Containers: Drums.

Uses: Dyes; reagent for iron determination; intermediate.

thiosemicarbazide (aminothiurea) $\text{NH}_2\text{CSNHNH}_2$.

Properties: White crystalline powder, no odor, soluble in water and alcohol. Melting point $180\text{--}184^\circ\text{C}$. Low toxicity.

Derivation: From potassium thiocyanate and hydrazine salts.

Grades: Technical and pure.

Containers: Bottles; drums.

Uses: Reagent for ketones and certain metals; photography; rodenticide.

thiosinamine. See allyl thiourea.

"Thiostat-B."²⁴⁸ Trademark for 40% aqueous solution of sodium dimethyldithiocarbamate.

Uses: Bactericide in oil-well water flooding; paper slimicide; specialty bactericide.

"Thiostop."²⁴⁸ Trademark for aqueous solutions of the sodium and potassium salts of dimethyl dithiocarbamate.

Properties: Clear yellow to amber liquid; sp. gr. 1.18–1.23; good storage stability; potassium salt will crystallize out at 20°F and the sodium at 32°F. Avoid long storage in partially filled containers.

Uses: Shortstop in SBR polymerization.

"Thiotax."⁵⁸ Trademark for 2-mercaptobenzothiazole (q.v.).

thiotepa. U.S.P. name for triethylenethiophosphoramide.

thiouracil (2-thio-4-oxypyrimidine; 2-mercapto-4-hydroxypyrimidine) HOCNC(SH)NCH_3 .

Properties: White, odorless, powder; bitter taste; melts with decomposition at about 340°C; characteristic ultraviolet absorption spectrum; slightly soluble in water, alcohol, and ether. Combustible.

Hazard: Moderately toxic by ingestion.

Uses: Medicine; veterinary medicine.

thiourea (thiocarbamide) $(\text{NH}_2)_2\text{CS}$.

Properties: White, lustrous crystals; bitter taste; sp. gr. 1.406; m.p. 180–182°C; b.p. sublimes in vacuo at 150–160°C; soluble in cold water, ammonium thiocyanate solution, and alcohol; nearly insoluble in ether.

Derivation: (1) By heating dry ammonium thiocyanate, extraction with a concentrated solution of ammonium thiocyanate with subsequent crystallization; (2) action of hydrogen sulfide on cyanamide.

Grades: Technical; reagent.

Containers: Bottles; bags.

Hazard: Toxic. May not be used in food products (FDA). Skin irritant (allergenic).

Uses: Photography and photocopying papers; organic synthesis (intermediates, dyes, drugs, hair preparations); rubber accelerator; analytical reagent; medicine (external); amino resins; mold inhibitor.

"Thiovanic Acid."³¹² Trademark for thioglycolic acid (q.v.).

"Thiovanol."³¹² Trademark for vacuum-distilled alpha-monothioglycerol. See 1-thioglycerol.

thioxyleneol (mixed isomers) $\text{C}_6\text{H}_3(\text{CH}_3)_2\text{SH}$.

Properties: Colorless liquid; sp. gr. 1.03 (15.6/15.6°C); b.p. 122–133°C (50 mm). Oxidizes on exposure to air; supplied under nitrogen atmosphere. Combustible.

Uses: Chemical intermediate; peptizer for natural and SBR rubbers.

thiram (USAN) (tetramethylthiuram disulfide; bis-(dimethylthiocarbamyl) disulfide; thiuram; TMTD) $[(\text{CH}_3)_2\text{NCH}_2]_2\text{S}_2$.

Properties: White crystalline powder with a characteristic odor; soluble in alcohol, benzene, chloroform, carbon disulfide; insoluble in water, dilute alkali, gasoline; sp. gr. 1.29 (20°C); melting range 155–156°C.

Grades: 75% wettable powder; 95% technical powder; N.D.

Containers: 50-lb multiwall paper bags.

Hazard: Moderately toxic by ingestion and inhalation;

irritant to skin and eyes. Tolerance, 5 mg per cubic meter of air.

Uses: Vulcanizing agent for rubber, especially for steam hose and other heat-resistant uses; fungicide; insecticide; seed disinfectant; lube oil additive; bacteriostat; animal repellent.

"Thiramad."³²⁹ Trademark for a 75% thiram formulation. A turf fungicide.

Hazard: See thiram.

"Thiram-75W."²⁴⁸ Trademark for a tetramethylthiuram disulfide formulation; used in seed treatment.

Hazard: See thiram.

"Thiurad."⁵⁸ Trademark for tetramethylthiuram disulfide.

Hazard: See thiram.

thiuram. A compound containing the group R_2NCS . Most are disulfides. See thiram. The most common monosulfide is tetramethylthiuram monosulfide (trademarked "Thionex" and "Monex").

"Thixatrol" ST.²⁰² Trademark for a colloidal thixotropic agent, designed especially for use in the heat developing types of dispersers.

"Thixcin."²⁰² Trademark for a colloidal thixotropic agent used in paints, inks, cosmetics, calks, sealants, epoxy and polyester resins, pharmaceuticals, etc. to prevent pigment settling, syneresis, excess flow and penetration.

"Thixo-Jel."⁴⁷¹ Trademark for a Wyoming sodium bentonite. Used where a granular bentonite with high gelling and bonding characteristics is required.

"Thixon."⁴⁶⁵ Trademark for a family of adhesives or cements composed of mixtures of rubber and other bonding agents in solvents. Used in bonding natural and synthetic rubber to metals or plastics and for splicing various elastomers to themselves or each other.

thixotropy. The ability of certain colloidal gels to liquefy when agitated (as by shaking or ultrasonic vibration) and to return to the gel form when at rest. This is observed in some clays, paints, and printing inks which flow freely on application of slight pressure, as by brushing or rolling. Suspensions of bentonite clay in water display this property, which is desirable in oil-well drilling fluids. See also rheology; dilatancy.

Thomson, Sir J. J. (1856–1940). A native of England, Thomson entered Cambridge University in 1876 and remained there permanently as a professor of physics, especially in the field of electrical phenomena. His observations and calculations of cathode ray experiments led to proof of the existence of the electron as the lightest particle of matter (1896). This proof was announced at the Royal Institution in the following year. This was the keystone of the theory of atomic structure and one of the most notable discoveries in the history of science. (See Rutherford).

thomsonite $\text{NaCa}_2\text{Al}_5(\text{SiO}_4)_5 \cdot 6\text{H}_2\text{O}$. A mineral; one of the zeolites (q.v.).

thonzylamine hydrochloride $\text{C}_{16}\text{H}_{22}\text{N}_4\text{O} \cdot \text{HCl}$; 2-[(2-dimethylaminoethyl)(para-methoxybenzyl)amino]-pyrimidinehydrochloride.

$\text{CH}_3\text{OC}_6\text{H}_4\text{CH}_2\text{N}(\text{C}_4\text{H}_8\text{N}_2)\text{CH}_2\text{CH}_2\text{N}(\text{CH}_3)_2 \cdot \text{HCl}$.

Properties: White, crystalline powder with faint odor. M.p. 173–176°C. Very soluble in water; freely soluble

in alcohol and chloroform; practically insoluble in ether and benzene; pH (2% solution) 5.0–6.0.

Grade: N.F.

Use: Medicine (antihistamine).

"Thorazine."⁷¹ Trademark for a brand of chlorpromazine (q.v.).

thoria. See thorium dioxide.

thorin $\text{HOC}_{10}\text{H}_4(\text{SO}_3\text{H})_2\text{NNC}_6\text{H}_4\text{AsO}_3\text{H}_2$. A reagent for the colorimetric determination of microgram quantities of thorium.

Hazard: Toxic by ingestion.

thorite ThSiO_4 . A natural thorium silicate, usually impure, found in pegmatites.

Properties: Color black to orange; luster vitreous to resinous; hardness 4.5–5; sp. gr. 4.4–5.2; radioactive.

Occurrence: Norway, Ceylon.

Use: Source of thorium.

thorium Th Metallic element of atomic number 90; a member of the actinide series (Group IIIB of Periodic Table). Atomic weight 232.0381; valence 4; radioactive. No stable isotopes.

Properties: Soft metal with bright silvery luster when freshly cut; similar to lead in hardness when pure. Can be cold-rolled, extruded, drawn and welded. Sp. gr. about 11.7; m.p. about 1700°C; b.p. about 4500°C. Soluble in acids; insoluble in alkalis and water. Low toxicity. Some alloys may ignite spontaneously. The metal in massive form is not flammable. See Hazard. Source: Monazite, thorite. It is about as abundant as lead.

Derivation: (a) Reduction of thorium dioxide with calcium; (b) fused salt electrolysis of the double fluoride $\text{ThF}_4 \cdot \text{KF}$. The product of both processes is thorium powder, fabricated into the metal by powder metallurgy techniques. Hot surface decomposition to the iodide produces crystalbar thorium.

Forms available: Powder; unsintered bars; sintered bars; sheets.

Hazard: Flammable and explosive in powder form. Dusts of thorium have very low ignition points and may ignite at room temperature. Radioactive decay isotopes are dangerous when ingested.

Uses: Nuclear fuel (thorium 232 is converted to uranium 233 on neutron bombardment after several decay steps); sun lamps; photoelectric cells; target in x-ray tubes; alloys.

Shipping regulations: (powder) (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

Note: As of 1974, U.S. reserves of thorium were about 3 billion tons.

thorium acetylacetonate $\text{Th}[\text{OC}(\text{CH}_3)_2\text{CHCOCH}_3]_3$. Crystalline powder. Slightly soluble in water. Resistant to hydrolysis. A chelating, nonionizing compound.

thorium anhydride. See thorium dioxide.

thorium carbide ThC_2 .

Properties: Yellow solid; sp. gr. 8.96 (18°C); m.p. 2630–2680°C; b.p. approx. 5000°C. Decomposes in water.

Use: Nuclear fuel.

thorium chloride (thorium tetrachloride) ThCl_4 .

Properties: Colorless or white, lustrous needles (light yellow color caused by iron trace). Hygroscopic. Partially volatile. Crystallizes with variable water of crystallization. Soluble in alcohol, water. Sp. gr. 4.59; b.p. 928°C (decomposes); m.p. 820°C.

Grade: Technical; as 50% ThO_2 .

Containers: Glass bottles; fiber drums.

Hazard: Moderately toxic.

Use: Incandescent lighting.

thorium decay series. The series of radioactive elements produced as successive intermediate products when the element thorium undergoes its spontaneous natural radioactive disintegration into lead. Many of these are severe radioactive poisons when ingested or inhaled in the form of thorium dust particles.

thorium dioxide (thorium anhydride; thorium oxide; thoria) ThO_2 .

Properties: Heavy, white powder; sp. gr. 9.7; m.p. about 3300°C (highest of all oxides); b.p. 4400°C; hardness 6.5 (Mohs). Very refractory. Soluble in sulfuric acid; insoluble in water.

Derivation: Reduction of thorium nitrate.

Grades: Technical and purities to 99.8% ThO_2 ; granular particles, crystals.

Containers: Lined drums.

Uses: Ceramics (high temperature); gas mantles; nuclear fuel; flame spraying; crucibles; medicine; nonsilica optical glass; catalyst; thoriated tungsten filaments in incandescent lamps, cathodes in electron tubes, and arc-melting electrodes.

thorium disulfide ThS_2 . Dark brown-crystals; sp. gr. 7.30 (25/4°C); m.p. 1875–1975°C (vacuum); insoluble in water.

Use: Solid lubricant.

thorium fluoride ThF_4 .

Properties: White powder having approximate formula $\text{ThF}_4 \cdot 1.4\text{H}_2\text{O}$. Dehydrated between 200 and 300°C; sp. gr. (anhydrous) 6.32 (24°C); m.p. 1111°C. Above 500°C reacts with atmospheric moisture to form thorium oxyfluoride, ThOF_2 , and finally the oxide ThO_2 . Forms a series of compounds with other metallic fluorides such as NaF and KF.

Grades: 79–80% ThO_2 .

Containers: Glass bottles; fiber drums.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Production of thorium metal and magnesium-thorium alloys; high temperature ceramics. ThOF_2 is used as a protective coating on reflective surfaces.

thorium nitrate $\text{Th}(\text{NO}_3)_4 \cdot 4\text{H}_2\text{O}$.

Properties: White, crystalline mass. Soluble in water and alcohol. Strong oxidizing agent. M.p. 500°C (decomposes).

Grades: Technical; C.P.

Containers: Glass bottles; fiber drums.

Hazard: Dangerous fire and explosion risk in contact with organic materials; radioactive.

Uses: Medicine, reagent for determination of fluorine; thoriated tungsten.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label. Consult regulations for radioactive label requirement.

thorium oxalate $\text{Th}(\text{C}_2\text{O}_4)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White powder, insoluble in water and most acids. Sp. gr. (anhydrous) 4.637 (16°C). Soluble in solutions of alkali and of ammonium oxalates. Above 300–400°C decomposes to thorium oxide, ThO_2 .

Grades: Purities to 99.9%; as 59% ThO_2 .

Containers: Glass bottles; fiber drums.

Use: Ceramics.

thorium oxide. See thorium dioxide.

thorium sulfate (thorium sulfate, normal)

Properties: White, crystalline powder; sp. gr. 2.8; m.p. loses $4\text{H}_2\text{O}$ at 42°C , remainder at 400°C . Slightly soluble in water; soluble in ice water.

Grades: As 43% ThO_2 .

Containers: Glass bottles; fiber drums.

thorium tetrachloride. See thorium chloride.

"Thornel."²¹⁴ Trademark for a graphite yarn.

Properties: Tensile strength 200,000 psi; elastic modulus 25 million psi; sp. gr. about 1.5.

Uses: Structural components for high-performance aircraft; solid-propellant-rocket motor casings; reentry vehicles and deep submergence vessels; high-strength composites. See also graphite.

thortveitite. An ore containing 37–42% scandium oxide. A basic material in production of scandium.

Thr Abbreviation of threonine.

threonine (alpha-amino-beta-hydroxybutyric acid)

Properties: Colorless crystals, soluble in water; optically active.

DL-threonine, m.p. $228\text{--}229^\circ\text{C}$ with decomposition; L(–)-threonine (naturally occurring), m.p. $255\text{--}257^\circ\text{C}$ with decomposition;

DL-allo-threonine, m.p. $250\text{--}252^\circ\text{C}$.

Derivation: Hydrolysis of protein (casein); organic synthesis.

Containers: Bottles; drums.

Uses: Nutrition and biochemical research, dietary supplement.

threshold limit value (TLV). A set of standards established by the American Conference of Governmental Industrial Hygienists for concentrations of airborne substances in workroom air; they are time-weighted averages based on conditions which it is believed that workers may be repeatedly exposed to day after day without adverse effects. The TLV values are intended to serve as guides in control of health hazards, rather than definitive marks between safe and dangerous concentrations. In this book, these are indicated by the word "tolerance." See also air pollution.

thrombin. A proteolytic enzyme which catalyzes conversion of fibrinogen to fibrin and thus is essential in the clotting mechanism of blood. It is present in the blood in the form of prothrombin (q.v.) under normal conditions; when bleeding begins, the prothrombin is converted to thrombin, which in turn activates the formation of fibrin.

throwing oil. An oil applied to prepare raw silk and filament rayon for "throwing," the operation by which the filaments are twisted into threads. Applied by a bath, the oils condition the filaments and yarns for subsequent weaving or knitting. Usually compounded to be self-emulsifying and may contain a sizing agent such as dextrin, gelatin, etc. See also slashing compound.

throwing power. A term denoting the effectiveness of an electrolytic cell for depositing metal uniformly over the surface being electroplated particularly in irregular and recessed areas. The throwing power is the weight of deposition per unit distance between the electrodes.

THPC. See tetrakis(hydroxymethyl)phosphonium chloride.

thuja oil (arbor vitae oil).

Properties: Pale yellow essential oil; camphor-like odor;

sp. gr. 0.910–0.920; refractive index (n 20°D) 1.459; optical rotation -10° to -13° in 100 mm tube. Soluble in alcohol, ether, chloroform and carbon disulfide; in fixed oils and mineral oil. Combustible; low toxicity. Chief known constituents: Dextro-pinene; levofenchone; thujone; should contain not less than 60% ketones calculated as thujone.

Derivation: Distilled from the leaves of the white cedar, *Thuja occidentalis*.

Grades: Technical; F.C.C. (as cedarleaf oil).

Containers: Glass bottles.

Uses: Medicine; perfumery; flavoring.

thujone $\text{C}_{10}\text{H}_{16}\text{O}$. A terpene-type ketone contained in thuja oil and the oils of sage, tansy and wormwood.

Properties: Colorless liquid; sp. gr. 0.915–0.919 (20°C); b.p. 203°C . Insoluble in water; soluble in alcohol. Combustible; low toxicity.

Uses: Solvent.

thulia. See thulium oxide.

thulium Tm Atomic number 69; Group IIIB of the periodic table; a rare earth element of the lanthanide group. Atomic weight 168.9342. Valence 3. No stable isotopes.

Properties: Metallic luster; reacts slowly with water; soluble in dilute acids; salts colored green; sp. gr. 9.318; m.p. 1550°C ; b.p. 1727°C . Low toxicity.

Derivation: For source see rare earth minerals. Isolated by reduction of the fluoride with calcium.

Grades: Regular high purity (ingots, lumps).

Hazard: Fire risk in form of dust.

Uses: Ferrites; x-ray source.

thulium 170. Radioactive thulium of mass number 170, used as x-ray source in portable units.

Shipping regulations: Consult regulations.

thulium chloride $\text{TmCl}_3 \cdot 7\text{H}_2\text{O}$.

Properties: Green deliquescent crystals; m.p. 824°C ; b.p. 1440°C . Very soluble in water and alcohol.

thulium oxalate. $\text{Tm}_2(\text{C}_2\text{O}_4)_3 \cdot 6\text{H}_2\text{O}$.

Properties: Greenish white precipitate. Loses $1\text{H}_2\text{O}$ at 50°C . Soluble in aqueous alkali oxalates.

Derivation: Precipitation for a solution containing a thulium salt and a mineral acid by addition of oxalic acid.

Use: Analytical separation of thulium (and other rare-earth metals) from the common metals.

thulium oxide (thulia) Tm_2O_3 .

Properties: Dense white powder with greenish tinge; slightly hygroscopic; absorbs water and CO_2 from the air; sp. gr. 8.6. Exhibits a reddish incandescence on heating, changing to yellow and then white on prolonged heating. Slowly soluble in strong acids.

Derivation: By ignition of thulium oxalate, salt of other oxyacids or hydroxide.

Grades: 99–99.9%.

Containers: Glass bottles.

Use: Source of thulium metal.

"Thylate."²⁸ Trademark for a wettable off-white powder containing 65% thiram (q.v.).

Thylox process. A process whereby hydrogen sulfide from coke-oven gas is converted to elemental sulfur by absorption in a solution of arsenious oxide and soda ash (or sodium thioarsenate) in water. Air blown through the solution liberates sulfur, which can be skimmed off.

thyme oil. Essential oil distilled from flowering plant *Thymus vulgaris* or *Thymus zygis*.

Properties: Colorless to reddish brown liquid; pleasant odor and sharp taste; sp. gr. 0.910–0.935 (25/25°C); refractive index 1.4950–1.5050 (20°C); levorotatory, but no more than -3° ; very slightly soluble in water; soluble in alcohol. Combustible; low toxicity.

Chief constituents: Not less than 40% by volume of phenols, and including thymol, carvacrol, cymene, pinene, linalool, and bornyl acetate.

Grades: N.F.; F.C.C.; red; white.

Containers: Cans; drums.

Uses: Medicine, perfumery, cosmetics, toilet soaps, flavoring.

thymic acid. See thymol.

thymidine (thymine-2-deoxyriboside) $C_{10}H_{14}N_2O_5$. The nucleoside (deoxyriboside) of thymine. Occurs in DNA.

Properties: Crystalline needles; m.p. 185°C; dextro-rotatory in solution; soluble in water, methanol, hot alcohol, hot acetone and hot ethyl acetate; sparingly soluble in hot chloroform; soluble in pyridine and glacial acetic acid.

Use: Biochemical research.

Also available as trityl thymidine, and as tritiated thymidine in a radioactive form.

thymidylic acid. The nucleotide of thymine; i.e. the phosphate ester of thymidine.

thymine (5-methyluracil) $CH_3CC(O)NHC(O)NHCH$.

5-Methyl-2,4-dioxypyrimidine. One of the pyrimidine bases of living matter.

Properties: White crystalline powder; decomposes at 335–337°C; slightly soluble in hot water; insoluble in cold water, alcohol; sparingly soluble in ether; readily soluble in alkalies.

Derivation: Hydrolysis of deoxyribonucleic acids; from methylcyanoacetylurea by catalytic reduction.

Use: Biochemical research.

thymine-2-deoxyriboside. See thymidine.

thymol (isopropyl-meta-cresol; thyme camphor; thymic acid) $(CH_3)_2CHC_6H_3(CH_3)OH$.

Properties: White crystals with aromatic odor and taste. Soluble in alcohol, carbon disulfide, chloroform, glacial acetic acid, ether and fixed or volatile oils; slightly soluble in water and glycerol. Sp. gr. 0.979; m.p. 48–51°C; b.p. 233°C. Combustible.

Derivation: From thyme oil or other oils; synthetically from meta-cresol and isopropyl chloride by the Friedel-Crafts method at $-10^\circ C$.

Grades: Technical; N.F.; reagent.

Containers: Bottles; tins; drums.

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Perfumery; thymol compounds; microscopy; preservative; antioxidant; flavoring; laboratory reagent; synthetic menthol.

thymol blue (thymolsulfonphthalein)

Properties: Brown green powder or crystals; insoluble in water, soluble in alcohol or dilute alkali. M.p. 223°C (dec.).

Use: Acid base indicator in pH range 1.5 (pink) to 2.8 to 8 (yellow) to 9.6 (blue). See indicator.

thymol iodide. Principally dithymol diiodide,

Properties: Red-brown powder or crystals, slight aromatic odor; affected by light. Soluble in ether, chloro-

form and fixed or volatile oils; slightly soluble in alcohol, insoluble in water. Low toxicity. Combustible. **Derivation:** Interaction of thymol and potassium iodide in alkaline solution.

Grade: Technical.

Containers: Bottles; boxes; drums.

Uses: Medicine; feed additive.

thymolphthalein

Properties: White powder; m.p. 245°C; insoluble in water, soluble in alcohol and acetone and in dilute alkali and acids.

Uses: Medicine; acid base indicator in pH range 9.3 (colorless) to 10.5 (blue). See indicator.

thymolsulfonphthalein. See thymol blue.

Para-thymoquinone (2-isopropyl-5-methylbenzoquinone) $C_6H_2O_2(CH_3)CH(CH_3)_2$.

Properties: Bright yellow crystals; penetrating odor. M.p. 45.5°C; b.p. 232°C. Slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: From diazonium salt of aminothymol and nitrous acid.

Hazard: May be toxic.

Use: Fungicide.

"Thyrite."²⁴⁵ Trademark for composite dielectric or resistance material in molded form.

thyrocalcitonin. A thyroid hormone having significant effect on the calcium content of bone and blood. It can retard bone damage and may be involved in the incidence of dental caries and the form of dental calculus known as tartar.

thyroid.

Properties: Yellow, amorphous powder with slight odor, saline taste.

Derivation: Dried, cleansed, powdered thyroid gland obtained from domesticated animals.

Grade: U.S.P.

Use: Medicine (hormone). See thyroxine.

thyronine (desiodothyroxine)

$HOC_6H_4OC_6H_4CH_2CH(NH_2)COOH$. The para-hydroxyphenyl ether of tyrosine. Thyronine and its iodinated derivatives are used in biochemical research on the thyroid gland and its activity.

thyrotropic hormone (TSH; thyrotropin). A hormone secreted by the anterior lobe of the pituitary gland. It increases the rate of removal of iodine from the blood by the thyroid gland, of synthesis of the thyroid hormone, and of its release into the bloodstream. The thyrotropic hormone is a protein which has a low molecular weight (approximately 10,000) and which contains some carbohydrate.

thyroxine $C_{15}H_{11}I_4NO_4$ or

$HOC_6H_2I_2OC_6H_2I_2CH_2CH(NH_2)COOH$. 3,5,3',5'-Tetraiodothyronine. The hormone produced by the thyroid gland. (See also triiodothyronine). It is an amino acid and a derivative of tyrosine. It increases the metabolic rate and oxygen consumption of animal tissues.

Properties: Optically active; the L-isomer is the natural and physiologically active form.

DL-thyroxine: Needles; decompose 231–233°C; insoluble in water, alcohol, and the common organic solvents; soluble in alcohol in the presence of mineral acids or alkalies.

L-thyroxine: Crystals; decompose 235–236°C.

D-thyroxine: Crystals; decompose 237°C.

Derivation: Obtained from the thyroid glands of animals; also made synthetically.

Uses: Medicine; biochemical research.

Ti Symbol for titanium.

TIBAL. Abbreviation for triisobutylaluminum (q.v.).

"Ticon."³³⁷ Trademark for a series of metal salts used as additives in ferroelectric and piezoelectric devices. They include barium, bismuth, calcium, cerium, lead, magnesium, strontium and zinc titanates; barium, bismuth, calcium, lead, magnesium, and strontium zirconates; barium, calcium and strontium stannates.

tiglic acid (methylcrotonic acid; crotonic acid; trans-2-methyl-2-butenic acid) $\text{CH}_3\text{CH}:\text{C}(\text{CH}_3)\text{COOH}$. The trans isomer of angelic acid.

Properties: Thick, syrupy liquid or colorless crystals; spicy odor. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 0.9641; m.p. 65°C; b.p. 198.5°C. Combustible.

Derivation: From croton oil. Also occurs in English chamomile oil.

Hazard: Toxic by ingestion.

Use: Medicine.

tigilium oil. See croton oil.

"Ti-Kote."⁵³⁷ Trademark for bonded coating of a silicon carbide material completely impermeable to all gases. Has unusual resistance to abrasion, thermal shock, oxidation, mineral acid corrosion. Used for mechanical seals of pumps, ejector nozzles, thermocouple protection tubes, molds and mandrels, rocket nozzle inserts, nuclear fuel elements, missile leading edges, spacecraft re-entry surfaces, and deflection elements.

tin (stannum) Sn Metallic element of atomic number 50; group IVA of the periodic system. Atomic weight 118.69; valences 2, 4. There are ten isotopes.

Properties: Silver-white, ductile solid (beta form); sp. gr. (20°C) 7.29; m.p. 232°C; b.p. 2260°C; changes to brittle grey (alpha) tin at temperatures below 18°C but the transition is normally very slow. Soluble in acids, and hot potassium hydroxide solution; insoluble in water. Elemental tin has low toxicity, but organic compounds of tin are toxic.

Derivation: By roasting the ore (cassiterite) to oxidize sulfates and to remove arsine, then reducing with coal in a reverberatory furnace, or by smelting in an electric furnace. Secondary recovery from tin plate.

Occurrence: Malaysia (called Straits tin), Indonesia, Thailand, Bolivia.

Grades: By % purity. Spectrographic grade is 99.9999%. Block tin is a common designation for pure tin.

Forms: Sheet; wire; tape; pipe; bar; ingot; powder; single crystals.

Hazard: All organic compounds of tin are toxic. Tolerance (as Sn), 0.1 mg per cubic meter of air.

Uses: Tin plate;terneplate; Babbitt metal; pewter; bronze; packaging and wrapping foil; collapsible tubes; anodes for electrotin plating; hot-dipped coatings; cladding; solders; low-melting alloys for fire control, organ pipes, dental amalgams, diecasting, white, type and casting metal; manufacture of chemicals; tinned wire (all copper wire which is to be rubber covered). Block tin is used in coating copper cooking utensils and lead sheet, or lining lead pipe for distilled water, beer, carbonated beverages, and some chemicals.

Note: In speaking of fabricated articles "tin" is often used when tinplate (thin sheets of steel coated with tin) is meant; e.g. "a tin can." To distinguish, articles (such

as condenser coils) made of solid tin are said to be made of "block tin." For further information refer to Tin Research Institute, Inc., 483 West Sixth Ave., Columbus, Ohio.

tin anhydride. See stannic oxide.

tin ash. See stannic oxide.

tin bisulfide. See stannic sulfide.

tin bronze. See stannic sulfide.

tinical. See borax.

tincture. An alcoholic or aqueous alcoholic solution of an animal or vegetable drug or a chemical substance. The tincture of potent drugs is essentially a 10% solution. Tinctures are more dilute than fluid extracts and less volatile than spirits (q.v.).

"Tinopal."²¹⁹ Trademark for a group of optical brighteners, which absorb ultraviolet light in the near visible range and re-emit the energy as visible light. Uses: In heavy duty detergents and detergent specialties, to whiten fabrics; in soap bars as product brighteners; starch products; plastic (e.g. molded grade nylon), fibers; coatings, waxes, etc.

tin oxide. See stannous oxide.

tin plating. The process of covering steel, iron or other metal with a layer of tin by dipping in the molten metal, by electroplating, or by immersion in solutions which deposit tin by chemical action of their components. Ingredients for the chemical process are cream of tartar and stannous chloride. The metal being plated also takes part in the process. The objective is to utilize the superior corrosion resistance of tin and in some cases to improve appearance. See also *terneplate*.

tin protochloride. See stannous chloride.

tin protosulfide. See stannous sulfide.

tin protoxide. See stannous oxide.

tin resinate. See soap (2).

tin salt. See stannous chloride.

tin spirits. Solutions of tin salts used in dyeing.

tin tetrabromide. See stannic bromide.

tin tetrachloride. See stannic chloride.

tin tetraiodide. See stannic iodide.

"Tinuvin."²¹⁹ Trademark for a group of ultraviolet absorbers; substituted hydroxyphenyl benzotriazoles. Example: See 2-(2'-hydroxy-5'-methylphenyl)benzotriazole.

Properties: Off-white to pale yellow powders. One or more are soluble in styrene, methyl methacrylate, cyclohexane, toluene, xylene. Characterized by high UV absorptivity below 400 mμ, high light transmission in the visible range. Stable to temperatures normally encountered in plastics production. Also stable to strong acid, peroxide catalysts, reducing agents.

Uses: Protection of plastics (including polyolefins), coatings, rubber, adhesives, waxes, oils.

See also ultraviolet absorber.

"Tipersul."²⁸ Trademark for fibrous potassium titanate. Crystalline fibers 1 micron in diameter melting at 2500°F; useful to 2200°F. Used for high temperature thermal, acoustical and electrical insulation; also for filter media. Available as lumps, blocks, and loose fibers.

"Ti-Pure."²⁸ Trademark for titanium dioxide pigments available in two types, rutile and anatase. Both are fine, dry, white powders, available in various grades. Rutile; sp. gr. 4.2; refractive index 2.71. Anatase; sp. gr. 3.88; refractive index 2.53.

Containers: 50-lb bags.

Use: Paints; lacquers; paper; leather; inks; rubber; plastics.

"Tirex."¹⁶⁰ Trademark for flexible, lead-cured cord and cable.

"Tiron."¹⁶⁹ Trademark for disodium-1,2-dihydroxybenzene-3,5-disulfonate.

Uses: Colorimetric determination of ferric iron, titanium, or molybdenum.

Tischenko reaction. Reaction for the formation of esters by the condensation of two molecules of aldehyde catalyzed by aluminum alcoholate in the presence of a halide.

titanellow. See titanium trioxide (Not to be confused with titan yellow, an organic dye containing no titanium).

titania. See titanium dioxide.

titanic acid (titanic hydroxide; metatitanic acid)

H_2TiO_3 or $\text{Ti}(\text{OH})_4$. Water content variable.

Properties: White powder; insoluble in mineral acids and alkalis except when freshly precipitated; insoluble in water.

Derivation: From hydrochloric acid solution of titanates by treating with ammonia and then drying over concentrated sulfuric acid or by boiling titanium sulfate solution.

Grades: Technical.

Containers: Bottles; fiber drums; multiwall paper bags.

Use: Mordant.

titanium Ti Metallic element of atomic number 22; Group IVB of Periodic Table. Atomic weight 47.90; valences 2, 3, 4. There are 5 isotopes.

Properties: Silvery solid or dark gray amorphous powder) density 4.5 g/cc (20°C); m.p. 1675°C; b.p. 3260°C; specific heat 0.13 Btu/lb/°F; thermal conductivity 105 Btu/ft²/°F/hour; as strong as steel but 45% lighter; Vickers hardness 80–100; excellent resistance to atmospheric and seawater corrosion, and to corrosion by chlorine, chlorinated solvents and sulfur compounds; reactive when hot or molten. Insoluble in water. Inert to nitric acid but attacked by concentrated sulfuric acid and hydrochloric acid. Unaffected by strong alkalis. Low toxicity.

Sources: Ilmenite, rutile, titanite, titanium slag from certain iron ores.

Derivation: (a) Reduction of titanium tetrachloride with magnesium (Kroll process) or sodium in an inert atmosphere of helium or argon. The titanium sponge is consolidated by melting. (b) Electrolysis of titanium tetrachloride in a bath of fused salts (alkali or alkaline-earth chlorides).

Grades: Technical (powder); commercially pure (sheets, bars, tubes, rods, wire and sponge); single crystals.

Containers: Wet powder in cans, boxes or 10-, 100-lb kegs, sponge in steel pails.

Hazard: (dry powder) Flammable, dangerous fire and explosion risk. (Metal) Ignites in air at 1200°C; will burn in atmosphere of nitrogen. Do not use water or carbon dioxide to extinguish.

Uses: Alloys (especially ferrotitanium); as structural material in aircraft, jet engines, missiles, marine

equipment, textile machinery, chemical equipment (especially as anode in chlorine production), desalination equipment, surgical instruments, orthopedic appliances, foodhandling equipment; x-ray tube targets; abrasives; cermets; metal-ceramic brazing, especially in nickel-cadmium batteries for space vehicles; electrodeposited and dipped coatings on metals and ceramics; electrodes in chlorine battery.

Shipping regulations: Powder, wet (with not less than 20% water) or dry. (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

titanium acetylacetonate. See tianyl acetylacetonate.

titanium boride (titanium diboride) TiB_2 .

Properties: Extremely hard solid with oxidative resistance up to 1400°C. M.p. 2980°C; sp. gr. 4.50; hardness 9+ (Mohs); low electrical resistivity.

Uses: Metallurgical additive; high-temperature electrical conductor; refractory; cermet component; coatings resistant to attack by molten metals; aluminum manufacture; super alloys; nuclear steels.

titanium butylate. See tetrabutyl titanate.

titanium carbide TiC .

Properties: Extremely hard crystalline solid with gray metallic color; m.p. $3140^\circ \pm 90^\circ\text{C}$; b.p. 4300°C ; sp. gr. 4.93; resistivity 60 micron-ohm-cm (room temperature). Insoluble in water; soluble in nitric acid and aqua regia.

Uses: Additive (with tungsten carbide) in making cutting tools and other parts subjected to thermal shock; arc-melting electrodes; cermets; coating dies for metal extrusion (.0002 inch film by vapor deposition).

titanium chelate. A titanium compound whose general formula is $(\text{HOYO})_2\text{Ti}(\text{OR})_2$ or $(\text{H}_2\text{NYO})_2\text{Ti}(\text{OR})_2$ where Y and R are hydrocarbon groups, e.g., octylene glycol titanate; triethanolamine titanate.

Uses: Surface-active agents; corrosion inhibitors; cross-linking agents.

titanium diboride. See titanium boride.

titanium dichloride TiCl_2 .

Properties: Black powder; sp. gr. 3.13. Decomposed by water; decomposes at 475° in vacuum. Hygroscopic; soluble in alcohol; insoluble in chloroform, ether, carbon disulfide.

Derivation: Reduction of titanium tetrachloride with sodium amalgam; dissolving titanium metal in hydrochloric acid.

Hazard: Flammable, dangerous fire risk. Ignites in air. Keep under water or inert gas.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

titanium dioxide (titanic anhydride; titanic acid anhydride; titanic oxide; titanium white; titania) TiO_2 .

Properties: White to black powder, depending on purity; is also prepared in two crystalline forms anatase (q.v.) and rutile (q.v.). It has the greatest hiding power of all white pigments. Noncombustible. Nontoxic.

Derivation: From ilmenite or rutile. (a) Ilmenite is treated with sulfuric acid and the titanium sulfate further processed. The product is primarily the anatase form. (b) Rutile is chlorinated and the titanium tetrachloride converted to the rutile form by vapor-phase oxidation.

Grades: Technical, of many variations; pure; U.S.P., single crystals; whiskers.

Containers: Fiber drums; multiwall paper bags.

Uses: White pigment in paints, paper, rubber, plastics, etc.; opacifying agent; cosmetics; radioactive decontamination of skin; floor coverings; glassware and ceramics; enamel frits; delustering synthetic fibers; printing inks; welding rods. Single crystals are high-temperature transducers.

titanium disilicide. Ti_2Si . Used for special alloy applications, as a flame or blast impingement-resistant coating material.

titanium disulfide TiS_2 . Yellow solid. Sp. gr. 3.22 (20°C). Decomposed by steam.
Use: Solid lubricant.

titanium ester. A titanium compound whose general formula is $\text{Ti}(\text{OR})_4$ where R is a hydrocarbon group, e.g., tetraisopropyl titanate. See also tetrabutyl titanate, tetra(2-ethylhexyl) titanate.

Uses: Adhesion promoters, ester exchange catalysts, cross-linking agents; heat-resistant paints.

titanium ferrocene. See titanocene dichloride.

titanium hydride TiH_2 .

Properties: Black metallic powder, which dissociates above 288°C . The evolution of hydrogen is gradual and practically complete at 650°C . Sp. gr. 3.8. Attacked by strong oxidizing agents. Low toxicity.

Derivation: Direct combination of titanium with hydrogen; reduction of titanium oxide with calcium hydride in the presence of hydrogen above 600°C .

Containers: Polyethylene bags in metal drums.

Hazard: Flammable, dangerous fire risk. Dust may explode in presence of oxidizing agents.

Uses: Powder metallurgy; production of pure hydrogen (contains approx 1800 cc (STP) hydrogen per cc of hydride); production of foamed metals; solder for metal-glass; electronic getter; reducing atmosphere for furnaces; hydrogenation agent; refractories.

Shipping regulations: (Air) Flammable Solid label. Not acceptable on passenger planes.

titanium isopropylate. See tetraisopropyl titanate.

titanium monoxide TiO . A weakly basic oxide of titanium, prepared by reduction of the dioxide at 1500°C . It has no important industrial uses.

titanium nitride TiN .

Properties: Golden-brown, hard, brittle plates; m.p. 2927°C ; sp. gr. 5.24; specific heat 8.86 cal/mole at 25°C ; electrical resistivity 21.7 micro-ohm-cm.

Uses: High-temperature bodies, cermets, alloys, rectifiers, semiconductor devices.

titanium ore. See rutile and ilmenite.

titanium oxalate (titanous oxalate) $\text{Ti}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$.
Properties: Yellow prisms. Soluble in water; insoluble in alcohol and ether.

Derivation: Action of oxalic acid on titanous chloride.

titanium peroxide. See titanium trioxide.

titanium potassium fluoride (potassium titanium fluoride) TiK_2F_6 .

Properties: White leaflets. Soluble in hot water.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Titanic acid; titanium metal.

titanium potassium oxalate (potassium titanium oxalate) $\text{TiO}(\text{C}_2\text{O}_4\text{K})_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless, lustrous crystals. Soluble in water.

Derivation: By treating titanium hydroxide with potassium oxalate and oxalic acid.

Grades: Technical; pure; 22% TiO_2 (min).

Containers: Kegs; barrels.

Uses: Mordant in cotton and leather dyeing; sensitization of aluminum for photography.

titanium sesquisulfate. See titanous sulfate.

titanium sponge. The metal in crude form as reduced from the tetrachloride; ingots are made from it by consumable-electrode refining (arc-melting). See titanium.

titanium sulfate (Titanic sulfate; basic titanium sulfate; titanyl sulfate) $\text{Ti}(\text{SO}_4)_2 \cdot 9\text{H}_2\text{O}$; also $\text{TiOSO}_4 \cdot \text{H}_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$. A commercial material, possibly a mixture.

Properties: White cake-like solid; highly acidic, similar to 50% sulfuric acid; typical composition 20% TiO_2 , 50% H_2SO_4 , 30% H_2O ; hygroscopic; sp. gr. about 1.47; soluble in water; solutions hydrolyze readily unless protected from heat and dilution.

Derivation: Action of sulfuric acid on ilmenite ore.

Hazard: Toxic and irritant to skin and tissue.

Uses: Treatment of chrome yellow and other colors; production of titanous sulfate used as reducing agent or stripper for dyes; laundry chemical.

Shipping regulations: (Rail) Solution containing not more than 45% sulfuric acid: Corrosive liquid. White label.

titanium tetrachloride (titanic chloride) TiCl_4 .

Properties: Colorless liquid. Fumes strongly when exposed to moist air forming a dense and persistent white cloud. Pure: Sp. gr. 1.7609 at 0°C ; b.p. 136.4°C ; freezing point -30°C . Soluble in dilute hydrochloric acid; soluble in water with evolution of heat; concentrated aqueous solutions are stable and corrosive; dilute solutions precipitate insoluble basic chlorides.

Derivation: By heating titanium dioxide or the ores and carbon to redness in a current of chlorine.

Grades: Technical; C.P.

Containers: Glass bottles; steel drums; tank cars.

Hazard: Toxic by inhalation; strong irritant to skin and tissue.

Uses: Pure titanium and titanium salts; mordant dye; iridescent effects in glass; smoke screens; titanium pigments; polymerization catalyst.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

titanium trichloride (titanous chloride) TiCl_3 .

Properties: Dark violet anhydrous deliquescent crystals.

Sp. gr. 2.6; decomposes above 440°C ; decomposes in air and water with heat evolution. Soluble in alcohol, acetonitrile, certain amines; slightly soluble in chloroform. Insoluble in ether and hydrocarbons.

Hazard: Fire risk in presence of oxidizing materials. Irritant to skin and tissue. MCA warning: Open container only in oxygen-free or inert atmosphere.

Uses: Reducing agent; organic synthesis; cocatalyst for polyolefin polymerization; organometallic synthesis involving titanium; laundry stripping agent.

Shipping regulations: (Rail, Air) Consult authorities.

titanium trioxide (titanium peroxide; pertitanic acid). TiO_3 .

Properties: Yellow powder; soluble in acids.

Containers: 1-, 5-lb bottles; fiber containers.

Uses: Dental porcelain and cements; yellow tile.

titanocene dichloride (dicyclopentadienyltitanium dichloride; titanium ferrocene) $(\text{C}_5\text{H}_5)_2\text{TiCl}_2$.

Properties: Red crystals; m.p. $287\text{--}289^\circ\text{C}$; moderately soluble in toluene, chloroform, sparingly soluble in ether and water; stable in dry air; slowly hydrolyzed in moist air.

Containers: Bottles; fiber drums.

Hazard: Toxic by inhalation; irritant to skin and mucous membranes.
See also metallocene.

titanous chloride. See titanium trichloride.

titanous oxalate. See titanium oxalate.

titanous sulfate (titanium sesquisulfate) $\text{Ti}_2(\text{SO}_4)_3$.

Properties: Green crystalline powder; insoluble in water, alcohol, concentrated sulfuric acid; but soluble in dilute hydrochloric or sulfuric acids giving violet solutions.

Grades: Commercial grade made and supplied as a dark purple solution containing about 15% $\text{Ti}_2(\text{SO}_4)_3$.

Containers: Glass bottles; carboys.

Use: Textile industry as reducing agent for stripping or discharging colors.

"Titanox."³³⁶ Trademark of a series of white pigments comprising titanium dioxide in both anatase and rutile crystal forms, and also extended with calcium sulfate (titanium dioxide-calcium pigment). Noncombustible; nontoxic.

Containers: Multiwall paper bags.

Uses: Paints, paper, rubber, plastics, leather and leather finishes, inks, coated textiles, textile delustering, ceramics, roofing granules, welding rod coatings, and floor coverings.

titanyl acetylacetonate (titanium acetylacetonate)

$\text{Ti}[\text{OC}(\text{CH}_3)_2\text{CHCOCH}_3]_2$.

Properties: Crystalline powder; slightly soluble in water. Resistant to hydrolysis. A chelating, nonionizing compound.

Derivation: Reaction of titanium oxychloride with acetylacetone and sodium carbonate.

Use: Crosslinking agent for cellulosic lacquers.

titanyl sulfate. See titanium sulfate.

titer. In solutions (1) the concentration of a dissolved substance as determined by titration; (2) the minimum amount or volume needed to bring about a given result in titration; or (3) the solidification point of fatty acids which have been liberated from the fat by hydrolysis.

titration. Any of a number of methods for determining volumetrically the concentration of a desired substance in solution by adding a standard solution of known volume and strength until the reaction is completed, usually as indicated by a change in color due to an indicator. Organic solvents are used in titrating water-insoluble substances (non-aqueous titration). Several types of electrical measurement techniques are used, among which are amperometric, conductometric, and coulometric titration methods, and spectrophotometry is a further possible procedure. Titration has been successfully automated, the extent depending on the type of measurement used.

TKP. Abbreviation for tripotassium phosphate. See potassium phosphate, tribasic.

TKPP. Abbreviation for tetrapotassium pyrophosphate. See potassium pyrophosphate.

Tl Symbol for thallium.

"TLA."⁵⁶⁹ Trademark for a series of lubricant additives.

TLV. See threshold limit value.

Tm Symbol for thulium.

TMA. Abbreviation for trimethylamine (q.v.) and trimellitic anhydride (q.v.).

TMEDA. Abbreviation for tetramethylethylenediamine (q.v.).

TML. Abbreviation for tetramethyllead (q.v.).

TMTD. Abbreviation for tetramethylthiuram disulfide. See thiram.

TNA. Abbreviation for tetranitroaniline (q.v.).

TNB. Abbreviation for trinitrobenzene (q.v.).

TNT. Abbreviation for trinitrotoluene (q.v.).

tobacco. Cured leaves of the plant *Solanaceae*, genus *Nicotiniana*; the species *N. tabacum* is the most important domestic source. Curing consists of drying and long ageing. The leaves are dehydrated by hanging in warm air to terminal moisture content of 20-30%, during which time starches reduce to sugars, the chlorophyll is discharged, and the color darkens. The product is then aged from one to five years to remove unpleasant odor; cigar tobacco is "fermented" with water, with resulting hydrolysis, deamination and decarboxylation. Aging and fermentation improve taste, aroma and smoking qualities. Humectants and flavoring agents are added to some cigarette blends.

Scores of chemical compounds have been identified in tobacco. Basically it is cellulose. The cured product contains acids (citric, oxalic, formic); alkaloids (nicotine, anabesine, myosmine); carbohydrates (lignin, pentosans, starch, sucrose); as well as tannin, ammonia, glutamine, and micro amounts of zinc, iodine, copper, and manganese. For contents of smoke, see cigarette tar; smoke (4).

A nicotine-free tobacco substitute trademarked "Cytrel" has been developed. See "Cytrel".

Hazard: May have toxic (possibly carcinogenic) effects on chronic inhalation.

tobacco mosaic virus. The first virus to be obtained in crystalline form (from diseased tobacco plants). The protein portion of this virus (95% of each particle) contains about 2300 peptide chains, each having about 150 amino acids and ending with threonine. Molecular weight of each chain is about 17,000; total m.w. about 40 million. The complete sequence of the amino acids has been determined.

tobermorite gel $3\text{CaO} \cdot 2\text{SiO}_2 \cdot 3\text{H}_2\text{O}$. A calcium silicate hydrate; a main cementing ingredient of concrete because of its great surface area.

Tobias acid. See 2-naphthylamine-1-sulfonic acid.

"Tobin Bronze-4641."³²⁴ Trademark for a high strength, corrosion-resistant rod alloy, developed originally for marine use. Nominal composition is copper 60%, zinc 39.25%, tin 0.75%.

TOC. Abbreviation for Tagliabue Open Cup, a standard method for determining flash points.

"Tocopherex."⁴¹² Trademark for *d*-alpha-tocopheryl acetate (q.v.).

***dl*-alpha-tocopherol.** $\text{C}_{29}\text{H}_{50}\text{O}_2$. *dl*-2,5,7,8-Tetra-methyl-2-(4',8',12'-trimethyltridecyl)-6-chromanol. One of the vitamin E group.

Properties: Clear yellow viscous oil; sp. gr. 0.947-0.958 (25/25°C); refractive index 1.5030-1.5070 (20°C). Nontoxic. See also tocopherol.

Derivation: Synthetic.

Grades: N.F.; F.C.C.

Uses: Biological antioxidant; dietary supplement; nutrient; medicine. Also available as the acetate.

tocopherol (vitamin E). Any of a group of related substances (alpha-, beta-, gamma-, and delta-tocopherol) which constitute vitamin E. The alpha-form, $C_{29}H_{50}O_2$, (which occurs naturally as the *d*-isomer), is the most potent. Occur naturally in plants, especially wheat germ. All are derivatives of dihydrobenzo-gamma-pyran, and differ from each other only in the number and position of methyl groups. Vitamin E is required by certain rodents for normal reproduction. Muscular and central nervous system depletion along with generalized edema are deficiency symptoms in all animals. It is not required as a dietary supplement for humans.

Properties: Viscous oils; soluble in fats; insoluble in water; stable to heat in the absence of oxygen, to strong acids, and to visible light; unstable to ultraviolet light, alkalis and oxidation. Nontoxic.

Uses: Medicine; nutrition; antioxidants for fats; animal feed additive.

tocophersolan (USAN) (*d*-alpha-tocopheryl polyethylene glycol 1000 succinate)

$C_{29}H_{49}O \cdot OOC(CH_2)_2COO(CH_2CH_2O)_n$ $n \approx 22$. A water-miscible vitamin E.

Use: Dietary food supplement; medicine.

"Tofaxin."¹⁶² Trademark for tocopherol (q.v.).

toiletries. Liquid cosmetic preparations usually consisting of an essential oil-alcohol mixture used chiefly for application to hair and scalp, as after-shave lotions, etc.

"Tok."²³ Trademark for 2,4-dichlorophenyl-4-nitrophenyl ether product, used as a herbicide.

tokamak. A magnetic fusion device developed in USSR and at Princeton. The latter is large enough to simulate conditions of plasma suitable for a fusion reactor. It will be used to study the laws of plasma physics. See plasma; fusion.

tolan (diphenylacetylene) $C_6H_5C:CC_6H_5$.

Properties: Monoclinic crystals; m.p. 59-61°C; b.p. 300°C; 170°C (19 mm); sp. gr. 0.966 (100/4°C). Insoluble in water; soluble in ether or hot alcohol.

Grades: Technical; purified.

Uses: Organic synthesis; purified grade, primary fluor or wave length shifter in solution scintillators.

"Toleron."³²⁹ Trademark for ferrous fumarate (q.v.).

"Tolex."⁴⁵⁷ Trademark for an aromatic solvent, proposed as an alternate for toluene. Distillation range (ASTM D86-59) 215-235°F.

ortho-tolidine (3,3'-dimethylbenzidine; diaminoditolyl) $[C_6H_3(CH_3)_2NH_2]_2$.

Properties: Glistening plates, white to reddish; m.p. 129-131°C. Soluble in alcohol and ether; sparingly soluble in water. Combustible. Affected by light. Low toxicity.

Derivation: Reduction of ortho-nitrotoluene with zinc dust and caustic soda and conversion of the hydrazotoluene by boiling with hydrochloric acid.

Grades: Technical, dry or paste.

Uses: Dyes; sensitive reagent for gold (1:10 million detectable); and for free chlorine in water; curing agent for urethane resins. (Also available as the dihydrochloride).

tolnaftate. USAN name for ortho-2-naphthyl meta, N-dimethylthiocarbaniolate,

$C_{10}H_7OC(SN(CH_3)_2)C_6H_4CH_3$.

Use: Antifungal treatment (medicine).

3-ortho-toloxyl-1,2-propanediol. See mephenesin.

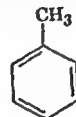

"Tolpit."⁷⁹ Trademark for a tall oil pitch used in roofing cements, caulking compounds; shoemaker's wax; asphalt emulsions and anti-stripping agents; coal dust briquetting.

tolualdehyde. See tolyl aldehydes.

toluazotoluidine. See ortho-aminoazotoluene.

tolu balsam. See balsam.

toluene methylbenzene; phenylmethane). 17th highest-volume chemical produced in U.S. (1975).

Properties: Colorless liquid; benzene-like odor. Sp. gr. 0.866 (20/4°C); f.p. -94.5°C; b.p. 110.7°C; refractive index 1.497 (20°C); aniline equivalent 15; flash point 40°F (C.C.). Autoignition temp. 997°F. Soluble in alcohol, benzene, and ether; insoluble in water.

Derivation: (a) By catalytic reforming of petroleum. (b) By fractional distillation of coal-tar light oil.

Method of purification: Rectification.

Grades (usually defined in terms of boiling ranges): Pure; commercial; straw-colored; nitration; scintillation; industrial.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 1.27 to 7%. Toxic by ingestion, inhalation, and skin absorption. Tolerance, 100 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Aviation gasoline and high-octane blending stock; benzene, phenol, and caprolactam; solvent for paints and coatings, gums, resins, most oils, rubber, vinyl organosols; diluent and thinner in nitrocellulose lacquers; adhesive solvent in plastic toys and model airplanes; chemicals (benzoic acid, benzyl and benzoyl derivatives, saccharin, medicines, dyes, perfumes); source of toluenediisocyanates (polyurethane resins); explosives (TNT); toluene sulfonates (detergents); scintillation counter.

Shipping regulations: (Rail) Red label. (Air) FLammable Liquid label. Legal label name (Rail): toluol.

toluene-2,4-diamine (meta-tolylenediamine; MTD; meta-tolylenediamine; diaminotoluene) $CH_3C_6H_3(NH_2)_2$, (CH₃ = 1).

Properties: Colorless crystals. Soluble in water, alcohol and ether. M.p. 99°C; b.p. 280°C.

Derivation: Reduction of meta-dinitrotoluene with iron and hydrochloric acid.

Hazard: Toxic by ingestion and inhalation. Skin irritant.

Uses: Dye intermediate; direct oxidation black for furs and hair; source for toluene-2,4-diisocyanate.

toluene-2,4-diisocyanate (2,4-tolylene diisocyanate; meta-tolylene diisocyanate; TDI) $CH_3C_6H_3(NCO)_2$. The 2,6-isomer is an impurity.

Properties: Water-white to pale yellow liquid; sharp, pungent odor; b.p. 251°C, 120°C (10 mm); flash point 270°F; m.p. (pure isomer) 19.5-21.5°C; sp. gr. 1.22 (25°/15.5°C); vapor pressure (approx) 0.01 mm at 20°C. Reacts with water producing CO₂; reacts with compounds containing active hydrogen (may be violent). Soluble in ether, acetone, and other organic solvents. Combustible.

Derivation: Reaction of 2,4-diaminotoluene with phosgene.

Method of purification: Distillation to remove hydrochloric acid.

Grade: 100% 2,4-isomer; 80% and 65% 2,4-isomer both mixed with 2,6-isomer.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion and inhalation; strong irritant to skin and tissue, especially to eyes. Tolerance, 0.02 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Polyurethane foams, elastomers and coatings; cross-linking agent for nylon 6.

toluene-2,6-diisocyanate. See toluene-2,4-diisocyanate.

para-toluenesulfamine. See para-toluenesulfonamide.

para-toluenesulfanilide $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{C}_6\text{H}_4\text{NH}_2$.

Properties: White to pink crystalline solid. M.p. 103°C. Soluble in most lacquer solvents. Combustible; low toxicity.

Derivation: Para-toluene sulfonchloride treated with aniline in presence of lime or carefully regulated amounts of alkalis.

Grade: Technical.

Uses: Softener for acetylcellulose in proportions up to 50%; dyestuff intermediate.

ortho-toluenesulfonamide $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NH}_2$.

Properties: Colorless crystals; m.p. 156.3°C; soluble in alcohol; slightly soluble in water and ether. Combustible.

Use: Plasticizer.

para-toluenesulfonamide (para-toluenesulfamine; PTSA). $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NH}_2$.

Properties: White leaflets. Soluble in alcohol; very slightly soluble in water. M.p. 137°C. Combustible.

Derivation: By amination of para-toluene sulfonchloride.

Uses: Organic synthesis; plasticizers and resins; fungicide and mildewicide in paints and coatings.

para-toluenesulfondichloroamide. See dichloramine-T.

ortho-toluenesulfonic acid (ortho-toluenesulfonate); $\text{C}_6\text{H}_4(\text{SO}_3\text{H})(\text{CH}_3)$.

Properties: Colorless crystals; m.p. 67.5°C; b.p. 129°C; soluble in alcohol, water, and ether. Combustible.

Derivation: By sulfonating toluene with concentrated sulfuric acid below 100°C.

Grades: Anhydrous; monohydrate; 40% aqueous solution.

Containers: 55-gal drums.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue.

Uses: Dyes; organic synthesis; acid catalyst.

Shipping regulations: (solution) (Air) Corrosive label.

para-toluenesulfonic acid (para-toluenesulfonate)

$\text{C}_6\text{H}_4(\text{SO}_3\text{H})(\text{CH}_3)$.

Properties: Colorless leaflets; m.p. 107°C; b.p. 140°C (20 mm). Soluble in alcohol, ether, and water. Combustible.

Derivation: By action of chlorosulfonic acid on toluene at a low temperature.

Grades: Anhydrous; monohydrate; 40% aqueous solution.

Containers: 55-gal drums.

Hazard: Moderately toxic; skin irritant.

Uses: Dyes; organic synthesis; organic catalyst.

ortho-toluenesulfonyl chloride (ortho-toluenesulfochloride; ortho-toluenesulfonylchloride) $\text{H}_3\text{CC}_6\text{H}_4\text{SO}_2\text{Cl}$.

Properties: Oily liquid; sp. gr. 1.3383 (20/4°C); m.p. 10.2°C; b.p. 154°C (36 mm). Insoluble in water; soluble in hot alcohol and in ether and benzene. Combustible.

Derivation: Action of chlorosulfonic acid on toluene.

Use: Intermediate in the synthesis of saccharin and dyestuffs.

para-toluenesulfonyl chloride (para-toluenesulfochloride; para-toluenesulfonylchloride) $\text{H}_3\text{CC}_6\text{H}_4\text{SO}_2\text{Cl}$.

Properties: Solid; m.p. 71°C; b.p. 145–146°C (15 mm). Insoluble in water; soluble in alcohol, ether, and benzene. Combustible.

Use: Organic synthesis.

para-toluenesulfonyl semicarbazide $\text{C}_8\text{H}_{11}\text{N}_3\text{O}_3\text{S}$.

Properties: Fine white powder; sp. gr. 1.438; decomposition temperature, 440°F dry, 415–430°F, compounded.

Use: Blowing agent for polyolefins, impact polystyrene, polypropylene, ABS, etc.

toluenethiol (thiocresol, tolyl mercaptan). $\text{CH}_3\text{C}_6\text{H}_4\text{SH}$.

Properties: Cream to white moist crystals; musty odor; b.p. about 195°C. Insoluble in water; soluble in alcohol or ether. There are three isomers with different boiling points.

Hazard: May be toxic and skin irritant.

Uses: Medicine; intermediate; bacteriostat.

alpha-toluenethiol. See benzyl thiol.

toluene trichloride. See benzotrifluoride.

toluene trifluoride. See benzotrifluoride.

toluhydroquinone $\text{CH}_3\text{C}_6\text{H}_3(\text{OH})_2$.

Properties: Pink to white crystals; m.p. 126–127°C; slightly soluble in water; soluble in alcohol and acetone.

Containers: Fiber drums.

Uses: Antioxidant; polymerization inhibitor.

alpha-toluic acid. See phenylacetic acid.

meta-toluic acid (meta-toluylic acid; 3-methylbenzoic acid) $\text{C}_6\text{H}_4\text{CH}_3\text{COOH}$.

Properties: White to yellowish crystals; slightly soluble in water; soluble in alcohol and ether. Sp. gr. 1.0543; m.p. 109°C; b.p. 263°C; ionization constant 5.3×10^{-5} . Combustible; low toxicity.

Derivation: Oxidation of meta-xylene with nitric acid. Uses: Organic synthesis; to form N,N-diethyl-metatuamide, a broad-spectrum insect repellent.

ortho-toluic acid (ortho-toluylic acid; 2-methylbenzoic acid) $\text{C}_6\text{H}_4\text{CH}_3\text{COOH}$.

Properties: White crystals; slightly soluble in water; soluble in alcohol and chloroform. Sp. gr. 1.0621; m.p. 103.5–104°C; b.p. 259°C; refractive index (114.6°C) 1.512; ionization constant 1.2×10^{-5} . Combustible; low toxicity.

Derivation: Oxidation of ortho-xylene with dilute nitric acid.

Uses: Bacteriostat.

para-toluic acid (para-toluylic acid; 4-methylbenzoic acid) $\text{C}_6\text{H}_4\text{CH}_3\text{COOH}$.

Properties: Transparent crystals; slightly soluble in water; soluble in alcohol and ether. M.p. 180°C; b.p. 275°C; ionization constant 4.3×10^{-5} . Combustible; low toxicity.

Derivation: By treating cymene or turpentine with nitric acid.

Uses: Agricultural chemicals; animal feed supplement.

alpha-toluic aldehyde. See phenylacetaldehyde.

meta-toluidine (meta-aminotoluene) $\text{CH}_3\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Colorless liquid; sp. gr. 0.980; f.p. -31.5°C ; b.p. 203.3°C ; slightly soluble in water; soluble in alcohol or ether. Flash point 187°F . Combustible.

Derivation: Reduction of meta-nitrotoluene.

Containers: Drums; tank cars.

Hazard: Toxic by inhalation and ingestion; absorbed by skin. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Dyes; manufacture of organic chemicals.

Shipping regulations: (Air) Poison label.

ortho-toluidine (ortho-aminotoluene) $\text{CH}_3\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Light yellow liquid; becomes reddish brown on exposure to air and light; volatile with steam. Sp. gr. 1.008 ($20/20^\circ\text{C}$); f.p. -16°C ; b.p. 200°C ; flash point 185°F . Soluble in alcohol and ether; very slightly soluble in water. Combustible.

Derivation: By the reduction of ortho-nitrotoluene or obtained mixed with para-toluidine by the reduction of crude nitrotoluene.

Grade: Technical.

Containers: 450-, 900-lb drums; tank cars.

Hazard: Toxic by inhalation and ingestion; absorbed by skin. Tolerance, 5 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Dyes; printing textiles blue-black and making various colors fast to acid; vulcanization accelerators; organic synthesis.

Shipping regulations: (Air) Poison label.

para-toluidine (para-aminotoluene) $\text{CH}_3\text{C}_6\text{H}_4\text{NH}_2$.

Properties: White, lustrous plates or leaflets. Sp. gr. 1.046 ($20/4^\circ\text{C}$); m.p. 45°C ; b.p. 200.3°C . Soluble in alcohol and ether; very slightly soluble in water. Flash point 189°F . Combustible.

Derivation: By the reduction of para-nitrotoluene with iron and hydrochloric acid.

Grades: Technical, flake or cast.

Containers: 450-, 900-lb drums.

Hazard: Toxic by inhalation and ingestion; absorbed by skin. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Dyes; organic synthesis; test reagent for lignin, nitrite, phloroglucinol.

toluidine maroon

$\text{CH}_3\text{C}_6\text{H}_3\text{NO}_2\text{N}_2\text{C}_{10}\text{H}_5\text{OHCONHC}_6\text{H}_4\text{NO}_2$. An organic azo pigment obtained by the azo coupling of meta-nitro-para-toluidine with the meta-nitroanilide of beta-hydroxynaphthoic acid.

Properties: Good lightfastness and weather resistance; excellent acid and alkali resistance; poor resistance to bleeding.

Hazard: May be toxic.

Uses: Air-dried and baked enamels; truck body finishes.

toluidine red. Any of a class of pigments based on couplings of beta-naphthol and meta-nitro-para-toluidine. See toluidine maroon.

tolu oil (tolu balsam oil).

Properties: Yellow liquid; hyacinth-like odor. Soluble in alcohol, ether, chloroform and carbon disulfide. Sp. gr. 0.945-1.09.

Chief known constituents: A terpene, $\text{C}_{10}\text{H}_{16}$, and esters of cinnamic and benzoic acid.

Derivation: From tolu balsam by distillation.

Grade: Technical.

Use: Medicine (expectorant); cough syrups. See also balsam.

toluol. Obsolete name for toluene.

toluquinone (2-methylquinone; para-toluquinone)

$\text{CH}_3\text{C}_6\text{H}_3\text{O}_2$.

Properties: Yellow leaflets or needles; m.p. $65-67^\circ\text{C}$; soluble in hot water; very soluble in alcohol, ether, acetone, ethyl acetate, and benzene.

"Tolu-Sol."¹²⁵ Trademark for a series of solvents, predominantly C_7 hydrocarbons, low in naphthenic hydrocarbons and containing from 3% to 50% aromatics, the balance being essentially paraffinic. Used mainly as lacquer diluents and gravure ink solvents.

Hazard: May be flammable.

toluyl aldehyde. See tolyl aldehyde.

toluylene. See stilbene.

meta-toluylenediamine. See toluene-2,4-diamine.

toluylene red. See neutral red.

meta-, ortho-, and para-toluylic acid. See corresponding toluic acid.

tolyl acetate. See cresyl acetate.

para-tolylaldehyde (para-toluyl aldehyde; para-tolualdehyde; para-methylbenzaldehyde) $\text{CH}_3\text{C}_6\text{H}_4\text{CHO}$.

Properties: Colorless liquid; refractive index (n_{D}^{20}) 1.54693; sp. gr. 1.020; b.p. 204°C ; slightly soluble in water; soluble in alcohol and ether. There are also ortho and meta isomers. Combustible.

Grades: Technical; pure.

Containers: Tins; drums.

Uses: Perfumes; pharmaceutical and dyestuff intermediate; flavoring agent.

alpha-tolylaldehyde dimethylacetal. See phenylacetaldehyde dimethylacetal.

4-ortho-tolylazo-ortho-diacetotoluide. See diacetylaminotoluene.

ortho-tolyl biguanide $\text{NH}_2(\text{CNHNH})_2\text{C}_6\text{H}_4\text{CH}_3$.

Properties: White to off-white powder; m.p. 138°C (min). Combustible.

Use: Antioxidant for soaps produced from animal or vegetable oil.

para-tolyl diethanolamine $(\text{HOC}_2\text{H}_4)_2\text{NC}_6\text{H}_4\text{CH}_3$.

Properties: Crystals. M.p. 62°C ; b.p. 297.1°C ; vapor pressure <0.1 (20°C); sp. gr. 1.0723 ($20/20^\circ\text{C}$); solubility in water 1.67% by weight (20°C); viscosity 155 cp (20°C). Very soluble in acetone, ethanol, ethyl acetate, benzene. Flash point 385°F . Combustible. Low toxicity.

Containers: 500-lb drums.

Uses: Emulsifier, dyestuff intermediate.

meta-tolylenediamine. See toluene-2,4-diamine.

meta-tolylenediaminesulfonic acid [4,6-diamino-metatoluenesulfonic acid ($\text{SO}_3\text{H} = 1$)]

$\text{CH}_3\text{C}_6\text{H}_2(\text{NH}_2)_2\text{SO}_3\text{H}$.

Properties: White crystalline solid; soluble in alkalies.

Derivation: By addition of meta-toluylenediamine sulfate to oleum and heating.

Hazard: May be toxic.

Use: Dyes.

meta-tolylenediisocyanate. See toluene-2,4-diisocyanate.

para-tolyl isobutyrate. See para-cresyl isobutyrate.

para-tolyl-1-naphthylamine-8-sulfonic acid (tolylperi acid) $C_{17}H_{15}NO_3S$.

Properties: Greenish gray needles. Soluble in alcohol; rather insoluble in water. Combustible.

Derivation: Arylation of 1-naphthylamine-8-sulfonic acid with para-toluidine.

Grades: Technical; mostly as sodium salt.

Hazard: May be toxic.

Use: Azo colors.

para-tolyl phenylacetate. See para-cresyl phenylacetate.

N-meta-tolylphthalamic acid. See "Durasel."

tolyl-para-toluenesulfonate. See cresyl-para-toluenesulfonate.

tomatidine. A steroid secondary amine; the nitrogenous aglycone of tomatine. Isolated from the roots of the Rutgers tomato plant as the hydrochloride, $C_{27}H_{45}NO_2 \cdot HCl$. Crystals decompose at 275–280°C.

tomatine. A glycosidal alkaloid prepared from the dried leaves and stems of the tomato plant. White crystals, used as plant fungicide and as a specific precipitating agent for cholesterol. The crude extract is referred to as tomatin.

"Tona."¹⁷³ Trademark for a proteolytic enzyme meat-tenderizer. Supplied as powder and used as liquid.

"Tonalid."¹⁰⁵ Trademark for 1,1,2,2,3,3,5-heptamethylindan-6-methyl ketone. Readily soluble in all common perfumery raw materials, solvents and aerosol propellants. Stable and non-discolorizing in soaps and cosmetics. Used as a musk odorant.

"Tonco."⁵¹⁸ Trademark for octadecyl isocyanate, technical.

toner. An organic pigment which does not contain inorganic pigment or inorganic carrying base. (ASTM) See also lake. Important toners are Pigment Green 7, Pigment Blue 15, Pigment Yellow 12, and Pigment Blue 19.

tonka (tonka bean; coumarouna bean; dipteryx).

Properties: Black-brownish seeds with wrinkled surface and brittle shining or fatty skins; aromatic, bitterish taste; balsamic, vanilla-like odor; efflorescences of coumarin often appear on the surface. Combustible; nontoxic.

Derivation: Bean of *Dipteryx oppositifolia* and other species of the *Dipteryx*.

Occurrence: Brazil, Guiana and Venezuela.

Grades: Angostura; Brazilian.

Containers: Casks; cases.

Uses: Production of natural coumarin; medicine; flavoring extracts; toilet powders.

tonka bean camphor. See coumarin.

"Tonox."²⁴⁸ Trademark for a blend of aromatic primary amines, the main component of which is para, para-diaminodiphenylmethane.

Uses: Epoxy and urethane curative.

topochemical reaction. Any chemical reaction that is not expressible in stoichiometric relationships. Such reactions are characteristic of cellulose; they can take place only at certain sites on the molecule where reactive groups are available, i.e., in the amorphous areas or on the surfaces of the crystalline areas.

"Tophel."¹⁵⁵ Trademark for a nickel-base thermocouple alloy of approximately 10% chromium. Contains a number of minor elements to give proper E.M.F.

against pure platinum and produces a black oxide whose structure matches the alloy.

Properties: M.p. 2600°F; density 8.63 g/cc; sp. heat at 20°C, 0.11 cal/gm; tensile strength at 20°C 88,000 psi.

"Tophet."¹⁵⁵ Trademark for a group of alloys composed of nickel and chromium.

TOPO. Abbreviation for trioctylphosphine oxide (q.v.).

"Toranil."¹⁶⁸ Trademark for a desugared calcium lignosulfonate produced from a desugared extract of coniferous woods.

Uses: Adhesives, binding agents, dispersants, refractory materials, boiler water treating compounds, oil well drilling muds, dye mordants, emulsifiers and foaming agents, concrete, leather, agricultural sprays.

"Tordon."²³³ Trademark for herbicides and defoliants containing 4-amino-3,5,6-trichloropicolinic acid (q.v.) as the potassium, isopropanolamine, etc. salts. Relatively nontoxic.

torr. A pressure unit used chiefly in vacuum technology; it is the pressure required to support 1 millimeter of mercury at 0°C.

torula yeast. A yeast that utilizes fermentable sugar in industrial wastes, such as fruit cannery refuse and sulfite liquor from pulp mills. The dried yeast is high in protein and vitamin content, enabling it to be used for enriching animal feeds. The enzymes present are destroyed during drying. It is now being made by a new process utilizing petroleum-derived ethyl alcohol.

tosyl (Ts). The para-toluenesulfonyl radical, $CH_3C_6H_4SO_2$ —. Esters of para-toluenesulfonic acid are known as tosylates.

Toth process. A comparatively recent process for production of aluminum metal, which utilizes kaolin and other high-alumina clays as well as bauxite. The clay is chlorinated after calcination and the aluminum chloride resulting is reacted with metallic manganese to yield aluminum and manganese chloride. The reaction occurs at the comparatively low temperature of 500°F. The manganese chloride is recovered as manganese metal and chlorine by oxidation and subsequent reduction, the manganese being recycled. This is a much cheaper and more efficient method than the present Hall process, and if successful it may be used extensively, especially in view of its much lower electric energy requirement.

tourmaline $(Na,Ca)(Al,Fe)B_3Al_3(AlSi_2O_6)(O,OH,F)_4$. A complex borosilicate of aluminum.

Uses: Pressure gauges; optical equipment; oscillator plates; source of boric acid.

"Toval."²⁸ Trademark for a dense, economical gelatine dynamite used in construction and quarry work.

"Tovex."²⁸ Trademark for a series of non-nitroglycerin water-compatible explosives with varying densities. Sensitized with an amine nitrate, and manufactured as a cartridge water gel, it is much more resistant than dynamite to accidental detonation.

toxaphene. Generic name for technical chlorinated camphene with the approximate formula $C_{10}H_{10}Cl_8$. Contains 67–69% chlorine.

Properties: Amber, waxy solid with a mild odor of chlorine and camphor; melting range 65–90°C; sp. gr. 1.66 (27°C). Soluble in common organic solvents.

Containers: Drums.

Hazard: Tolerance, 0.5 mg per cubic meter of air.

Use: Insecticide (primarily for cotton and early growth stage of vegetables).

toxicity. The ability of a substance to cause damage to living tissue, impairment of the central nervous system, severe illness or, in extreme cases, death when ingested, inhaled, or absorbed by the skin. The amounts required to produce these results vary widely with the nature of the substance and the time of exposure to it. "Acute" toxicity refers to exposure of short duration, i.e., a single brief exposure; "chronic" toxicity refers to exposure of long duration, i.e., repeated or prolonged exposures.

The toxic hazard of a material may depend on its physical state and on its solubility in water and acids. Some metals that are harmless in solid or bulk form are quite toxic as fume, powder or dust. Many substances that are intensely poisonous are actually beneficial when administered in micro amounts, as in prescription drugs, e.g., strychnine.

Toxicity is objectively evaluated on the basis of test dosages made on experimental animals under controlled conditions. Most important of these are the LD₅₀ (lethal dose, 50%) and the LC₅₀ (lethal concentration, 50%) tests, which include exposure of the animal to (a) oral ingestion, (b) extended skin contact, and (c) inhalation of the material under test. Such studies are the basis for toxicity ratings determined by the Manufacturing Chemists Association and by the Dept. of Health, Education and Welfare. Reference to these sources should be made for detailed clinical information on toxicity of materials. See also poison (1); toxic materials.

toxic materials. The following list includes a number of chemical individuals and groups that are generally regarded as having toxic properties by either ingestion, inhalation, or absorption via the skin. There is considerable variation in the degree of toxicity among these, and the listing is by no means exhaustive. See also toxicity.

Individuals	Groups
aniline	aldehydes
arsenic and cpds.	alkaloids
asbestos (carcinogen)	allyl cpds.
barium and soluble cpds.	barbiturates
beryllium and soluble cpds.	chlorinated hydrocarbons
benzidine (carcinogen)	corrosive materials (q.v.)
cadmium and cpds.	cyanides
benzpyrene (carcinogen)	fluorides
carbon monoxide	organic phosphate esters
chlorine	radioactive elements
chromium (hexavalent cpds.)	
coal-tar pitch (carcinogen)	
cresol	
fluorine and cpds.	
hydrogen peroxide	
hydrogen sulfide	
hydrogen selenide	
lead compounds	
mercury (soluble cpds.)	
methyl alcohol	
nickel carbonyl	
osmium tetroxide	
oxalic acid	
ozone	
phenol	
pyrene	
pyridine	
phosphine	

selenium cpds.

stibine

sulfur dioxide

thallium (soluble cpds.)

tin (organic cpds.)

vinyl chloride monomer (carcinogen)

Note: An International Register of Potentially Toxic Chemicals (IRPTC) is under development by a group of toxicologists in Geneva. The data will be available to UN member countries.

toxicology. The branch of medical science devoted to the study of poisons, including their mode of action, effects, detection, and countermeasures. The subject may be subdivided into (1) clinical, (2) environmental, (3) forensic, and (4) occupational (industrial). The Institute of Chemical Toxicology was formed in 1975, its members comprising a number of the larger chemical companies. See also toxicity; poison (1).

TPA. Abbreviation for terephthalic acid (q.v.).

TPB. Abbreviation for tetraphenylbutadiene (q.v.).

TPG. Abbreviation for triphenylguanidine (q.v.).

TPN. Abbreviation for triphosphopyridine nucleotide. See nicotinamide adenine dinucleotide phosphate.

Tpp. (1) Abbreviation for triphenyl phosphate (q.v.).

(2) Abbreviation for thiamine pyrophosphate. See co-carboxylase.

"TPSA."⁵⁸ Trademark for tetrapropenylsuccinic anhydride. See dodecenylsuccinic anhydride.

"TPS-PG."¹ Trademark for a polyester resin stabilizer/accelerator.

TPT. (1) Abbreviation for triphenyltetrazolium chloride. See tetrazolium chloride.

(2) Abbreviation for tetraisopropyl titanate (q.v.).

trace element (micronutrient). An element essential to plant and animal nutrition in trace concentrations, i.e., minute fractions of 1 per cent (1000 ppm or less). Plants require iron, copper, boron, zinc, manganese, molybdenum, sodium, and chlorine. Animals require iron, copper, iodine, manganese, cobalt, and selenium. Such elements are also called micronutrients. Do not confuse with "tracer" (q.v.).

tracer. A chemical entity (almost invariably radioactive and usually an isotope) added to the reacting elements or compounds in a chemical process, which can be traced through the process by appropriate detection methods, e.g., Geiger counter. Compounds containing tracers are often said to be "tagged" or "labelled." Carbon-14 (q.v.) is a commonly used tracer, and radioactive forms of iodine and sodium are also used. Many complex biochemical reactions have been examined in this way (e.g., photosynthesis). Nonradioactive deuterium (hydrogen isotope) is sometimes used, the detection being by molecular weight determination. Radioactive enzymes are also available for tracer studies, e.g., ribonuclease, pepsin, trypsin, and others. See also labeling (2).

trade mark. A word, symbol, or insignia designating one or more proprietary products, or the manufacturer of such products, which has been officially registered with the government trademark agency. The accepted designation is a superior capital R enclosed in a circle; however, quotation marks may also be used, as in this Dictionary. The term "trade name", though widely used, is not applicable to such products; ac-

cording to the U.S. Trade Mark Association, a trade name is the name under which a company does business, e.g., the Blank Chemical Company. Use of a trade mark without proper indication of its proprietary nature places the name in jeopardy; a number of trade marks have been invalidated as a result of this practice.

trade name. See trade mark.

trade sales. In the paint industry this term is applied to paints intended for sales to the general public, as in hardware stores and similar outlets.

tragacanth gum.

Properties: Dull white, translucent plates or yellowish powder. Soluble in alkaline solutions, aqueous hydrogen peroxide solution; strongly hydrophilic; insoluble in alcohol. Combustible; nontoxic.

Constituents: Polysaccharides of galactose, fructose xylose and arabinose with glucuronic acid.

Occurrence: Southwestern Europe, Greece, Turkey, Iran.

Grades: U.S.P.; F.C.C.; No. 1, 2, 3.

Containers: Barrels; cases.

Uses: Pharmacy (emulsions), adhesives; leather dressing; textile printing and sizing; thickener and emulsifier; dyes; food products (ice cream, desserts); toothpastes; coating soap chips and powders; hair wave preparations.

tranquilizer. See psychotropic drug.

trans-. See cis-.

"Trans-4."³⁰³ Trademark for trans-1,4-polybutadiene rubber.

transalkylation. A type of disproportionation reaction (q.v.) by which toluene is hydrogenated to benzene and mixed xylene isomers free from ethylbenzene, avoiding the formation of methane resulting from the conventional hydrodealkylation process (q.v.). Transalkylation of toluene to benzene involves the use of an undisclosed catalyst; the yield is claimed to be 97%, based on toluene feed.

transferase. An enzyme whose activity causes a transfer of a radical from one molecule to another. Examples are transaminases, transacetylases, and transmethy-lases, which effect the transfer of amino, acetyl, methyl groups respectively. See enzyme.

transfer RNA. See ribonucleic acid.

transference number. That portion of the total current carried by any species of ion in an electrolyte in the fluid state. The symbol t^+ is usually used for a positive ion and t^- for a negative ion.

transformer oil. A liquid having the property of insulating the coils of transformers, both electrically and thermally. There are two broad classes, (1) natural and (2) synthetic. The natural type includes refined mineral oils (petroleum fractions), which have low viscosity and high chemical and oxidative stability. The synthetic types are (a) chlorinated aromatics (chlorinated biphenyls and trichlorobenzene) known collectively as askarels (q.v.); (b) silicone oils; and (c) ester liquids such as dibutyl sebacate. All these types are nonflammable, but are combustible. Flash points are from 250 to 300°F. See also dielectric.

Note: Use of PCB (chlorinated biphenyls) has been discontinued because of their ecologically damaging effects.

"TransistAR."³²⁹ A grade of reagent quality chemicals, specially controlled for use in the manufacture of semiconductors and other electronic devices and precision instruments.

transition element (transition metal) Any of a number of elements in which the filling of the outermost shell to 8 electrons within a period is interrupted to bring the penultimate shell from 8 to 18 or 32 electrons. Only these elements can use penultimate shell orbitals as well as outermost shell orbitals in bonding. All other elements, called "major group" elements, can use only outermost shell orbitals in bonding. Transition elements include elements 21 through 29 (scandium through copper), 39 through 47 (yttrium through silver), 57 through 79 (lanthanum through gold), and all known elements from 89 (actinium) on. All are metals. Many are noted for exhibiting a variety of oxidation states and forming numerous complex ions, as well as possessing extremely valuable properties in the metallic state. See also orbital theory.

R. T. Sanderson.

transmutation. The natural or artificial transformation of atoms of one element into atoms of a different element as the result of a nuclear reaction. The reaction may be one in which two nuclei interact, as in the formation of oxygen from nitrogen and helium nuclei (alpha particles), or one in which a nucleus reacts with an elementary particle such as a neutron or a proton. Thus a sodium atom and a proton form a magnesium atom. Radioactive decay e.g., of uranium, can be regarded as a type of transmutation.

"Transphalt."¹⁴⁰ Trademark for a series of dark thermoplastic resins which are polymeric polynuclear hydrocarbons. Available as 100°C softening point material.

Containers: Steel drums, tank trucks and cars.

Use: Paint, saturants for paper and wall board, pipe coatings, joint sealers, floor tile, extenders in epoxy systems, calendered and extruded rubber products, and secondary plasticizers.

transportation label. See label (1).

transuranic element. An element of higher atomic number than uranium, not found naturally, and produced by nuclear bombardment. The most recently discovered is 105. They are all radioactive. See actinide.

"Trebo-Phos."⁵⁷ Trademark for triple superphosphate.

"Treflan."⁵³⁰ Trademark for trifluralin.

"Trefmid."⁵³⁰ Trademark for selective herbicide composed of trifluralin and diphenamid.

"Trek."²¹⁴ Trademark for a concentrated synthetic methanol base antifreeze containing special corrosion inhibitors.

Properties: Deep violet (dye added) liquid; practically odorless. B.p. 149°F; sp. gr. (61/60°F) 0.800; vol concentration of antifreeze to lower freezing point of water solution to 0°F, 27%; -20°F, 37%; wt/gal at 68°F, 6.6 lbs.

Hazard: Highly toxic by ingestion.

Use: Automotive antifreeze.

tremolite $\text{Ca}_2\text{Mg}_5\text{Si}_8\text{O}_{22}(\text{OH})_2$. A variety of asbestos (q.v.). Some tremolite is sold as "fibrous talc."

Properties: Color white to light green; luster vitreous to silky; hardness 5-6; sp. gr. 3.0-3.3. Resistant to acids. Noncombustible.

Occurrence: New York, California, Maryland; South Africa.

Hazard: Inhalation of dust or fine particles is dangerous. Tolerance 177 particles per cc. of air. Carcinogenic.

Uses: As asbestos, particularly in acid-resisting applications; ceramics; paint.

"Trepax."³³⁷ Trademark for 90% minimum purity form of zirconium oxide. Contains 5% maximum silicon dioxide. M.p. 4500°F. Used as a source for zirconium oxide for welding rod coatings and to stabilize color in titanium enamels.

tretamine. Generic name for 2,4,6-tris(1-aziridinyl)-s-triazine. See under triethylenemelamine.

"Tret-O-Lite." Trademark for an oil-field demulsifying agent designed especially for breaking crude oil/water emulsions.

tri. Prefix meaning three.

triacetate fiber. See acetate fiber.

triacetin (glyceryl triacetate) $C_3H_5(CH_2CH_3)_3$.

Properties: Colorless liquid with slight fatty odor and a bitter taste; sp. gr. 1.160 (20°C); b.p. 258–260°C; sets to a glass below –37°C; refractive index 1.4312 (20°C); flash point 300°F; wt/gal 9.7 lbs. Slightly soluble in water; very soluble in alcohol, ether, and other organic solvents. Combustible. Low toxicity.

Derivation: Action of acetic acid on glycerol.

Method of purification: Vacuum distillation.

Grades: Technical; C.P.; N.D.; F.C.C.

Containers: Tins; drums; tank cars.

Uses: Plasticizer; fixative in perfumery; manufacture of cosmetics; specialty solvent; to remove carbon dioxide from natural gas; medicine (external); food additive.

triacontanoic acid. See melissic acid.

1-triacontanol $CH_3(CH_2)_{28}CH_2OH$. A 30-carbon straight-chain fatty alcohol.

Properties: Colorless needles from ether; m.p. about 85–88°C; soluble in most organic solvents; insoluble in water. Combustible. Low toxicity. Sp. gr. at melting point 0.777.

Occurrence: Beeswax; carnauba wax.

Use: Biochemical research.

"Triafil."⁴⁷⁰ Trademark for electric insulating film based on cellulose triacetate.

trialkyl boranes R_3B . See tributylborane; triethylborane.

trialkylsilanol. An alcohol derivative of silane.

Hazard: May be toxic and flammable.

Uses: Short stopping agent for silicone polymers.

triallylamine $(H_2C:CHCH_2)_3N$.

Properties: Liquid; sp. gr. 0.800 (20/4°C); f.p. below –70°C; b.p. 150–151°C; refractive index 1.4501 (n 20/D); flash point 103°F (TOC).

Hazard: Moderate fire risk; probably toxic and irritant.

Use: Intermediate.

triallyl cyanurate $(CH_2:CHCH_2OC)_3N_1$.

Properties: Colorless liquid or solid; m.p. 27.32°C; flash point >176°F (TOC); sp. gr. 1.1133 (30°C); refractive index n 25/D 1.5049. Miscible with acetone, benzene, chloroform, dioxane, ethyl acetate, ethyl alcohol, and xylene. Combustible.

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Polymers as monomer and modifier; organic intermediate.

triallyl phosphate $(CH_2:CHCH_2O)_3PO$.

Properties: Water-white liquid; f.p. below –50°C; b.p.

80°C (0.5 mm); refractive index 1.448 (n 25/D); sp. gr. 1.064 (25/15°C). Combustible.

Containers: 55-gal drums; tank trailers.

Hazard: Probably toxic.

Use: Intermediate.

triamcinolone (9 α -fluoro-16 α -hydroxyprednisolone) $C_{21}H_{27}FO_6$.

Properties: White crystalline powder; m.p. 264–268°C; insoluble in water; slightly soluble in usual organic solvents; soluble in dimethylformamide.

Grade: N.D.

Hazard: May be toxic.

Use: Medicine. Also available as the acetone.

1,3,5-triaminobenzene $C_6H_3(NH_2)_3$.

Properties: Solid; m.p., anhydrous, 129°C; hydrate, 84–86°C (1.5 moles water). Soluble in water, acetone, and alcohol. Insoluble in ether, cold benzene, carbon tetrachloride, and petroleum ether. Combustible.

Containers: Bottles; fiber drums. Supplied as hydrochloride.

Hazard: May be toxic.

Uses: Ion exchange resin intermediate; wetting and frothing agents; photographic developers; organic reactions.

2,4,6-triaminotoluene trihydrochloride

$C_6H_2(NH_2HCl)_3 \cdot CH_3 \cdot H_2O$.

Properties: Light tan to cream crystals; very soluble in water; soluble in alcohol and acetone; insoluble in benzene. Melting point 119°C (free base).

Containers: Bottles; fiber drums.

Uses: Nongelatin photographic emulsion with ethylenediamine for fixation; ion exchange resins; wetting and frothing agents; photographic developers; intermediate varnishes and rubber chemicals.

2,4,6-triamino-syn-triazine. See melamine.

triethylamine $(C_2H_5)_3N$.

Properties: Colorless to yellow liquid; sp. gr. (20°C) 0.79–0.80; triethylamine content at least 98.0%; 95% boils between 225 and 260°C; flash point 215°F; refractive index (18°C) 1.4374; insoluble in water; soluble in gasoline. Combustible.

Derivation: Reaction of amyl chloride and ammonia.

Containers: 1-gal, 5-gal cans; 55-gal drums.

Hazard: Toxic and irritant.

Uses: Corrosion inhibitor; insecticidal preparations.

triethylbenzene $(C_2H_5)_3C_6H_3$.

Properties: Colorless liquid. Sp. gr. (20°C) 0.87; boiling range 300–320°C; odor faintly aromatic. Flash point 270°F. Combustible.

Uses: Chemical intermediate.

triethyl borate $(C_2H_5)_3BO_3$.

Properties: Colorless liquid; sp. gr. (20°C) 0.845; boiling range 220–280°C; flash point 180°F; odor faintly alcoholic. Soluble in alcohol and ether. Combustible. Low toxicity.

Derivation: Direct heating of boric acid and amyl alcohol.

Use: Varnishes.

tri-para-tert-amylphenyl phosphate $(C_5H_{11}C_6H_4)_3PO$.

Properties: Liquid. Boiling range 305–345°C at 5mm; m.p. 62–63°C; white solid; odorless; insoluble in water. Combustible.

Hazard: Probably toxic.

Use: Plasticizer.

tri-para-anisylchloroethylene. See chlorotrianisene.

triarylmethane dye. Any of a group of dyes whose molecular structure involves a central carbon atom

joined to three aromatic nuclei. C.I. numbers range from 42000 to 44999. The color is due in part to the aromatic rings and to the chromophore groups $=C=NH$ and $=C=N-$. The members of this class function as basic dyes for cotton, using tannin as a mordant, or, if they contain sulfonic acid groups, as acid dyes for wool and silk. Examples are malachite green and methyl violet. See also triphenylmethane dye.

s-triazine derivatives. See ammelide; ammeline; melamine.

s-triazine-3,5(2H,4H)dione riboside. See 6-azauridine.

s-triazine-2,4,6-triol. See cyanuric acid.

triazole. A five-membered ring compound containing three nitrogens in the ring: $C_2H_3N_3$. Suggested as photoconductors in copying systems.

triazone resin. One of a class of amino resins produced from urea, formaldehyde and a primary amine. Used in textile and fabric treatment. See dimethylolethyl-triazone.

"Tribase."³⁰⁴ Trademark for lead sulfate, tribasic.

"Tribase-E." Basic lead silicate sulfate.

Uses: Stabilizer for vinyl resins.

tribasic. See monobasic.

tribromoacetaldehyde (bromal) $CBBr_3CHO$.

Properties: Oily yellowish liquid; sp. gr. 2.66; b.p. $174^\circ C$. Soluble in water, alcohol, or ether. Combustible.

Derivation: (a) By adding bromine to a solution of paraldehyde in ethylacetate. (b) By adding bromine to absolute alcohol, fractionating, treating the fraction boiling at $165^\circ C$ with water and distilling.

Hazard: Probably toxic. See bromine.

Uses: Medicine; organic synthesis.

tribromoacetic acid $CBBr_3COOH$.

Properties: Colorless crystals; soluble in water, alcohol, or ether. M.p. $135^\circ C$; b.p. $245^\circ C$ to $250^\circ C$. Combustible.

Derivation: By oxidizing tribromoacetaldehyde with nitric acid.

Hazard: Probably toxic. See bromine.

Use: Organic synthesis.

tribromo-tert-butyl alcohol (acetone-bromoform)

$CBBr_3C(CH_3)_2OH$.

Properties: Fine white prismatic crystals; camphor odor and taste; m.p. $176^\circ C$. Slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: Reaction of acetone and bromoform with solid potassium hydroxide.

Hazard: Probably toxic. See bromine.

Use: Medicine.

tribromoethanol (1,1,1-tribromoethyl alcohol)

$CBBr_3CH_2OH$.

Properties: White crystals or powder with slight aromatic odor and taste; m.p. $79-82^\circ C$; b.p. $94^\circ C$ (11 mm); unstable in air and light; slightly soluble in water; soluble in alcohol, ether, benzene, and amylene hydrate; aqueous and alcoholic solutions decompose on exposure to light. Combustible.

Grade: N.F.

Derivation: By reduction of tribromoacetaldehyde with aluminum isopropylate.

Hazard: Moderately toxic.

Use: Medicine (basal anesthetic).

tribromomethane. See bromoform.

1,1,1-tribromo-2-methyl-2-propanol $CBBr_3C(CH_3)_2OH$.

Properties: Fine white crystals; m.p. $176-177^\circ C$; soluble in water, methanol, ether. Combustible.

Hazard: May be toxic.

Use: Organic synthesis.

tribromonitromethane. See bromopicrin.

tribromophenol. See bromol.

tribromophenol-bismuth. See bismuth tribromophenate.

3,4'5-tribromosalicylanilide

$Br_2C_6H_2(OH)C(O)NHC_6H_4Br$. An active antiseptic; used in soaps.

tributoxyethyl phosphate $[CH_3(CH_2)_3O(CH_2)_3O]_3PO$.

Properties: Slightly yellow oily liquid. Insoluble or limited solubility in glycerin, glycols and certain amines. Soluble in most organic liquids. Sp. gr. 1.020 ($20^\circ C$); f.p. $-70^\circ C$ (viscous liquid); boiling range $215-228^\circ C$ (4 mm); flash point $435^\circ F$; refractive index 1.434 ($25^\circ C$). Combustible.

Containers: 5-gal cans; 55-gal steel drums.

Hazard: May be toxic.

Uses: Primary plasticizer for most resins and elastomers; floor finishes and waxes; flame-retarding agent.

tri-n-butyl aconitate $C_3H_7(COOC_4H_9)_3$.

Properties: Colorless, odorless liquid; sp. gr. 1.018 ($20^\circ C$); refractive index 1.4500-1.4530 ($25^\circ C$); b.p. $190^\circ C$ (3 mm); insoluble in water; soluble in organic solvents. Combustible.

Containers: Drums; tank cars.

Uses: Plasticizer-stabilizer for vinylidene chloride polymers, synthetic rubbers, and cellulosic lacquers; insecticides.

tri-n-butylaluminum $(CH_3CH_2CH_2CH_2)_3Al$.

Properties: Colorless pyrophoric liquid; density 0.823 g/ml ($20^\circ C$); f.p. $-26.7^\circ C$.

Derivation: Exchange reaction of butene-1 and isobutyl aluminum.

Hazard: Highly flammable, dangerous fire risk. Ignites spontaneously.

Use: Production of organo-tin compounds.

Shipping regulations: (Rail) Pyrophoric liquid, n.o.s., Red label. (Air) Not acceptable.

tri-n-butylamine $(C_4H_9)_3N$.

Properties: Pale yellow liquid with amine odor. B.p. $214^\circ C$; f.p. $-70^\circ C$; sp. gr. (20/ $20^\circ C$) 0.8; wt/gal 6.5 lbs; refractive index 1.4297 (n 20/D); flash point (open cup) $185^\circ F$. Slightly soluble in water; soluble in most organic solvents. Combustible. Low toxicity.

Derivation: By reaction of butanol or butyl chloride with ammonia.

Grade: Technical.

Containers: 5-, 55-gal drums; tank cars.

Uses: Solvent; inhibitor in hydraulic fluids; intermediate.

tri-n-butylborane (tri-n-butylborine)

$(CH_3CH_2CH_2CH_2)_3B$.

Properties: Colorless pyrophoric liquid; f.p. $-34^\circ C$; b.p. $+170^\circ C$ (222 mm); density ($25^\circ C$) 0.747 g/ml; vapor pressure ($20^\circ C$) 0.1 mm; refractive index (n 20/D) 1.4285; insoluble in water; soluble in most organic solvents. Flash point $-32^\circ F$.

Hazard: Highly flammable, dangerous fire risk; store and use in inert atmosphere; ignites spontaneously in air.

Uses: Petrochemical industry; organic reactions; catalyst.

Shipping regulations: (Rail) Pyrophoric liquid n.o.s., Red label. (Air) Not acceptable.

tributyl borate (butyl borate) $(C_4H_9)_3BO_3$.

Properties: Water-white liquid; sp. gr. 0.8550–0.8570; b.p. 232.4°C; distillation range, 85% distills between 135°C and 140°C (40 mm); refractive index (n 25/D) 1.4071; f.p. less than –70°C; viscosity 1.601 cp (25°C); flash point (open cup) 200°F; hydrolyzes rapidly; miscible with common organic liquids. Combustible.

Derivation: From butyl alcohol and boric acid.

Uses: Welding fluxes; intermediate in preparation of borohydrides; flame retardant for textiles (with boric acid).

tri-n-butylborine. See tri-n-butylborane.

tri-n-butylchlorostannane. See tributyltin chloride.

tributyl citrate (butyl citrate) $C_3H_5O(COOC_4H_9)_3$.

Properties: Colorless or pale yellow, stable, odorless nonvolatile liquid. Practically insoluble in water. F.p. –20°C; b.p. approximately 233.5°C at 22.5 mm; flash point 315°F (COC); refractive index 1.4453 at 20°C; sp. gr. (25/25°C) 1.042; wt/gal 8.7 lbs at 68°F; pour point –80°F; viscosity (25°C) 31.9 cp. Combustible. Low toxicity.

Grade: Technical.

Containers: Cans; drums; tank cars.

Uses: Plasticizer; antifoam agent; solvent for nitrocellulose.

tributyl(2,4-dichlorobenzyl)phosphonium chloride

$Cl_2C_6H_3CH_2P(C_4H_9)_3Cl$.

Properties: White, crystalline solid with a mild aromatic odor; soluble in water, acetone, ethanol, isopropanol and hot benzene; insoluble in hexane and ether; technical grade melts 114–120°C.

Use: Growth retardant for ornamental plants.

2,4,6-tri-tert-butylphenol $[(CH_3)_3C]_3C_6H_2OH$.

Properties: Solid; m.p. 131°C; insoluble in water; soluble in most organic solvents. Combustible.

Hazard: Moderately toxic.

Use: Permissible antioxidant for aviation gasolines (when mixed with other butylphenols) (ASTM).

tri-para-tert-butylphenyl phosphate

$[(CH_3)_3CC_6H_4O]_3PO$.

Properties: Solid; b.p. (5 mm) 320°C; m.p. 102–105°C; flash point 545°F; insoluble in water. Combustible.

Hazard: May be toxic.

Use: Plasticizer.

tributyl phosphate (TBP) $(C_4H_9)_3PO_4$.

Properties: Stable, colorless, odorless liquid. Miscible with most solvents and diluents. Soluble in water. Refractive index 1.4226 at 25°C; b.p. 292°C; latent heat of vaporization 55.1 cal/gm at 289°C; f.p. below –80°C; flash point 295°F (COC); Saybolt viscosity 38.6 seconds at 85°F; wt/gal 8.19 lbs; sp. gr. 0.978 (20/20°C). Combustible.

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal steel drums; tank cars.

Hazard: Toxic by ingestion and inhalation. Irritant to skin. Tolerance 5 mg per cubic meter of air.

Uses: Heat-exchange medium; solvent extraction of metal ions from solution of reactor products; solvent for nitrocellulose, cellulose acetate; plasticizer; pigment grinding assistant; antifoam agent; dielectric.

tri-n-butyl phosphine $(CH_3CH_2CH_2CH_2)_3P$.

Properties: Colorless liquid with garlic odor. Sp. gr. 0.8100 (min at 25/4°C); f.p. –60 to –65°C; b.p.

240°C; flash point 104°F; autoignition point 392°F; refractive index 1.463 (20°C); almost insoluble in water; miscible with ether, methanol, ethanol, benzene. An organic base and strong reducing agent. Combustible.

Uses: Polymerization cross-linking catalyst; organic intermediate; fuels.

tributyl phosphite $(C_4H_9O)_3P$.

Properties: Water-white liquid; b.p. 120°C (8 mm); sp. gr. 0.911 (25°C); refractive index (n 25/D) 1.4301; flash point 250°F. Decomposes in water. Soluble in common organic solvents. Combustible; low toxicity.

Containers: Carboys.

Uses: Additive for greases and extreme-pressure lubricants; stabilizer for fuel oils and polyamides; gasoline additive.

O,O,O-tributyl phosphorothioate (tributyl thiophosphate) $(C_4H_9O)_3PS$.

Properties: Colorless liquid with characteristic odor. B.p. (4.5 mm) 142–145°C; sp. gr. 0.987; flash point (COC) 295°F. Insoluble in water; soluble in most organic solvents. Combustible.

Containers: Bottles; drums.

Hazard: Highly toxic.

Uses: Plasticizer; lubricant additive; antifoam agent; hydraulic fluid; intermediate.

Shipping regulations: (Rail, Air) Organic phosphates, n.o.s., Poison label. Not accepted on passenger planes.

S,S,S-tributyl phosphorotrithioate ("DEF")

$(C_4H_9S)_3PO$.

Properties: Liquid; boiling point 150°C (0.3 mm). Insoluble in water; soluble in aliphatic, aromatic, and chlorinated hydrocarbons.

Hazard: Toxic. Possible cholinesterase inhibitor.

Use: Cotton defoliant.

tributylphosphorotrithioate $(C_4H_9S)_3P$.

Properties: Nearly colorless liquid; insoluble in water; soluble in a variety of organic solvents; b.p. (0.08 mm) 115–134°C; sp. gr. 1.02 (20°C); refractive index 1.542 (25°C).

Derivation: Reaction of butyl mercaptan with phosphorus trichloride.

Hazard: Probably toxic.

Use: Cotton defoliant.

tributyl thiophosphate. See tributyl phosphorothioate.

tributyltin acetate $(C_4H_9)_3SnOOCCH_3$.

Properties: White crystalline solid.

Derivation: Reaction of sodium acetate with tributyltin chloride.

Hazard: Toxic. Tolerance (as Sn), 0.1 mg per cubic meter of air.

Uses: Fungicide and bactericide.

tributyltin chloride (tri-n-butylchlorostannate)

$(C_4H_9)_3SnCl$.

Properties: Colorless liquid; soluble in the common organic solvents, including alcohol, heptane, benzene and toluene; insoluble in cold water, but hydrolyzes in hot water. Sp. gr. 1.20 (20/4°C); refractive index 1.4903 (n 25/D); b.p. 145–147°C (5 mm).

Derivation: Reaction of tetrabutyltin with dibutyltin chloride.

Hazard: Toxic. Tolerance (as Sn), 0.1 mg per cubic meter of air.

Uses: Rodenticide; intermediate; rodent-repellent cable coatings.

tributyltin oxide $(C_4H_9)_3SnOSn(C_4H_9)_3$.

Properties: Colorless to pale yellow liquid; soluble in

many organic solvents; practically insoluble in water; b.p. 180°C (2 mm)
 Hazard: Toxic. Tolerance (as Sn), 0.1 mg per cubic meter of air.
 Uses: Bactericide, fungicide; intermediate.

tri-n-butyl tricarballylate

$(C_4H_9OCOCH_2)_3CHCOOC_4H_9$.
 Properties: Liquid. Sp. gr. (24°C) 1.004; refractive index (26.5°C) 1.4388; b.p. 305°C; insoluble in water. Combustible.
 Use: Plasticizer.

tributylin. See glyceryl tributyrat.

tricalcium aluminate. See calcium aluminate.

tricalcium citrate. See calcium citrate.

tricalcium orthoarsenate. See calcium arsenate.

tricalcium orthophosphate. See calcium phosphate, tribasic.

tricalcium phosphate. See calcium phosphate, tribasic.

tricalcium silicate. See cement, Portland. Also used as an anticaking agent in foods (up to 2%).

tricamba. Generic name for 3,5,6-trichloro-ortho-anisic acid, $C_6HCl_3(COOH)(OCH_3)$.

Properties: Crystals; m.p. 137–139°C. Very slightly soluble in water; moderately soluble in xylene; freely soluble in alcohol.
 Hazard: May be toxic.
 Use: Herbicide.

tricarbimide. See cyanuric acid.

tricarboxylic acid cycle. See TCA cycle.

"Trichlor."¹⁷⁷ Trademark for trichloroethylene.

trichlorfon (dylox). Generic name for O,O-dimethyl (2,2,2-tri-chloro-1-hydroxyethyl)phosphonate, $(CH_3O)_2P(O)CH(OH)CCl_3$.

Properties: White crystalline solid; m.p. 83–84°C; b.p. 100°C (1 mm); sp. gr. 1.73 (20/4°C). Soluble in water, benzene, chloroform, ether; insoluble in oils.
 Hazard: Highly toxic; cholinesterase inhibitor. Absorbed by skin. Use may be restricted.
 Use: Systemic insecticide.

Shipping regulations: (Rail, Air) Organic phosphates, n.o.s. Poison label. Not acceptable on passenger planes.

trichloroacetaldehyde. See chloral.

trichloroacetaldehyde, hydrated. See chloral hydrate.

trichloroacetic acid (TCA) CCl_3COOH .

Properties: Deliquescent colorless crystals; sharp pungent odor; sp. gr. 1.6298; m.p. 57.5°C; b.p. 197.5°C; soluble in water, alcohol, and ether. Flash point, none. Nonflammable.

Derivation: (a) Treating chloral hydrate with fuming nitric acid; (b) from glacial acetic acid by the action of chlorine in presence of sunlight, ultraviolet radiation or catalysts.

Grades: Technical; C.P.; U.S.P.

Containers: Tightly stoppered glass bottles; drums; carlots.

Hazard: Toxic by ingestion and inhalation; strong irritant to skin and tissue.

Uses: Organic synthesis; reagent for detection of albumin; medicine; pharmacy; herbicides.

Shipping regulations: (solid and solution) (Air) Corrosive label. (Rail) Not listed.

trichloroacetyl chloride CCl_3COCl . Liquid; sp. gr. 1.654 (0/4°C); b.p. 118°C. Decomposes in water; soluble in alcohol.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to skin and tissue.

Shipping regulations: (Rail) Not listed. (Air) Not acceptable.

S-2,3,3-trichloroallyl-N,N-diisopropylthiolcarbamate $[(CH_3)_2CH]_2NC(O)SCH_2CCl_2CCl_2$.

Properties: Oily liquid; b.p. 148–149°C (9 mm); m.p. 29–30°C. Practically insoluble in water; soluble in alcohol, acetone, ether, and heptane. Combustible.

Hazard: Probably toxic.

Use: Herbicide.

trichloro-ortho-anisic acid. See tricamba.

1,2,3-trichlorobenzene $C_6H_3Cl_3$.

Properties: White crystals; sp. gr. (solid) 1.69; refractive index (19°C) 1.5776; b.p. 221°C; m.p. 52.6°C; insoluble in water; slightly soluble in alcohol; soluble in ether. Flash point 235°F (closed cup); combustible.
 Hazard: Moderately toxic by ingestion and inhalation.
 Use: Organic intermediate.

1,2,4-trichlorobenzene $C_6H_3Cl_3$.

Properties: Colorless, stable liquid. Odor similar to that of ortho-dichlorobenzene. Miscible with most organic solvents and oils. Insoluble in water. Sp. gr. 1.4634 (25°C); b.p. 213°C; m.p. 17°C; flash point 210°F. Combustible.

Derivation: Chlorination of monochlorobenzene.

Grades: Technical; 99%; mixture of 1,2,4- and 1,2,3-isomers distilling at 213–219°C.

Containers: Cans; drums; tank cars.

Hazard: Moderately toxic by ingestion and inhalation.
 Uses: Solvent in chemical manufacturing; dyes and intermediates; dielectric fluid; synthetic transformer oils; lubricants; heat-transfer medium; insecticides.

2,3,6-trichlorobenzoyloxypropanol

$(Cl)_3C_6H_2CH_2OCH_2CH(CH_3)OH$.

Properties: Liquid; b.p. 121–124°C (0.1 mm). Almost insoluble in water; soluble in most organic solvents. Combustible.

Hazard: Moderately toxic by ingestion and inhalation.
 Use: Herbicide.

1,1,1-trichloro-2,2-bis(chlorophenyl)ethane. See DDT.

1,1,1-trichloro-2,2-bis(para-methoxyphenyl)ethane. See methoxychlor.

B-trichloroborazole $BCl_3NBH_2BCl_2NBH_2BCl_3$.

Properties: White crystalline solid; m.p. 84.5–85.5°C; b.p. 96.5–98°C/37 mm. Soluble in many organic solvents. Highly reactive.

Uses: Intermediate; gelling agent; catalyst; complexing agent.

trichlorobromomethane. See bromotrichloromethane.

trichlorobutyraldehyde hydrate. See butyl chloral hydrate.

3,4,4'-trichlorocarbaniide $C_6H_3Cl_2NHCONHC_6H_4Cl$.

Colorless, heat-resistant, white powder; m.p. 250°C. Used as a bacteriostat in soaps and detergents, plastics.

1,1,1-trichloroethane (methyl chloroform) CH_3CCl_3 .

Properties: Colorless liquid; sp. gr. 1.325; b.p. 75°C; f.p. –38°C. Insoluble in water; soluble in alcohol and ether. Flash point, none. Nonflammable.

Containers: Drums; tank cars.

Hazard: Moderately toxic by inhalation. Tolerance, 350 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.
Uses: Solvent for cleaning precision instruments; metal degreasing; pesticide.

1,1,2-trichloroethane (vinyl trichloride; beta-trichloroethane) $\text{CHCl}_2\text{CH}_2\text{Cl}$.

Properties: Clear, colorless liquid. Characteristic sweet odor. B.p. 113.7°C ; sp. gr. 1.4432 ($20^\circ\text{C}/4^\circ\text{C}$); refractive index 1.4458; vapor pressure 16.7 mm (20°C); wt/gal 12.0 lbs (20°C); f.p. -36.4°C ; flash point, none; nonflammable. Miscible with alcohols, ethers, esters, and ketones; insoluble in water.

Grade: Technical.

Containers: 55-gal drums; tank cars.

Hazard: Toxic and irritant. Absorbed by skin. Tolerance, 10 ppm in air.

Uses: Solvent for fats, oils, waxes, resins, other products; organic synthesis.

trichloroethanol $\text{CCl}_3\text{CH}_2\text{OH}$.

Properties: Viscous liquid; ether-like odor. Slightly soluble in water; miscible with alcohol, ether, and carbon tetrachloride. B.p. 150°C ; f.p. (approx) 13°C ; sp. gr. ($25/4^\circ\text{C}$) 1.541. Combustible.

Hazard: Moderately toxic.

Use: Intermediate; anesthetic.

trichloroethylene (tri) $\text{CHCl}_2\text{CCl}_2$.

Properties: Stable, low-boiling, colorless, photoreactive liquid. Chloroform-like odor. Will not attack the common metals even in the presence of moisture; b.p. 86.7°C ; f.p. -73°C ; sp. gr. 1.456–1.462 ($25/25^\circ\text{C}$); refractive index 1.4735 (27°C). Miscible with common organic solvents; slightly soluble in water. Nonflammable.

Derivation: From tetrachloroethane by treatment with lime or alkali in the presence of water, or by thermal decomposition, followed by steam distillation.
Grades: U.S.P.; technical; high purity; electronic; metal degreasing; extraction.

Containers: Cans; drums; tank trucks; tank cars.

Hazard: Toxic by inhalation; causes cancer in mice. Use may be restricted. Tolerance, 100 ppm in air. Use prohibited in some states. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Metal degreasing; extraction solvent for oils, fats, waxes; solvent dyeing; dry cleaning; refrigerant and heat exchange liquid; fumigant; cleaning and drying electronic parts; diluent in paints and adhesives; textile processing; chemical intermediate; aerospace operations (flushing liquid oxygen).

trichlorofluoromethane (fluorotrichloromethane; fluorocarbon-11) CCl_3F .

Properties: Colorless, nearly odorless, volatile liquid. B.p. 23.7°C ; f.p. -111°C ; sp. gr. 1.494 (17.2°C); critical pressure 43.2 atm. Noncombustible.

Derivation: From carbon tetrachloride and hydrogen fluoride, in the presence of fluorinating agents such as antimony tri- and pentafluoride.

Grades: Technical; 99.9% min.

Containers: Drums; cylinders.

Hazard: Tolerance, 1000 ppm in air.

Uses: Solvent; fire extinguishers; refrigerant; air conditioning; chemical intermediate; blowing agent.

trichloroisocyanuric acid (1,3,5-trichloro-s-triazine-2,4,6-trione) OCNClCNCICl .

Properties: White, slightly hygroscopic, crystalline powder or granules; loose bulk density (approx)

powder 31 lbs/cu ft, granular 60 lbs/cu ft. Available chlorine 85%; decomp. 225°C .

Containers: 200-lb fiber drums.

Hazard: Moderately toxic by ingestion. Fire risk in contact with organic materials, strong oxidizing agent.

Uses: Active ingredient in household dry bleaches, dishwashing compounds, scouring powders, detergent-sanitizers, commercial laundry bleaches; swimming pool disinfectant; bactericide, algicide, bleach and deodorant.

Shipping regulations: Dry, containing more than 39% available chlorine: (Rail) Yellow label. (Air) Oxidizer label.

trichloroisopropyl alcohol. See isopral.

trichloromelamine (N,N',N'' -trichloro-2,4,6-triamine-

1,3,5-triazine) $\text{NC}(\text{NHCl})\text{NC}(\text{NHCl})\text{NC}(\text{NHCl})$.

Properties: Fine white powder; slightly soluble in water and glacial acetic acid; insoluble in carbon tetrachloride and benzene; pH saturated aqueous solution 4. Low toxicity.

Derivation: By chlorination of melamine.

Grades: 89% available chlorine; see "Sterimine."

Containers: Polyethylene bags in fiber drums.

Hazard: Dangerous fire risk; can ignite spontaneously in contact with reactive organic materials. Autoignition temp. 320°F .

Uses: Chlorine bleach and bactericide.

Shipping regulations: (Rail, Air) Not listed.

trichloromethane. See chloroform.

alpha-(trichloromethyl)benzyl acetate. See trichloromethylphenylcarbinyl acetate.

trichloromethyl chloroformate (diphosgene)

ClCOOCCl_2 .

Properties: Colorless liquid. Odor similar to phosgene (newmown hay). Decomposed by heat, porous substances, activated carbons (with evolution of phosgene); also by alkalis, hot water. Soluble in alcohol, benzene, and ether. Sp. gr. 1.65 (15°C); b.p. $127-128^\circ\text{C}$; f.p. -57°C ; vapor density 6.9 (air = 1); refractive index 1.45664 (22°C). Noncombustible.

Derivation: (a) By chlorinating methyl formate. (b) By chlorinating methyl chloroformate. In both methods the mixture of chloro-derivatives is then separated by fractionation.

Grade: Technical.

Hazard: Highly toxic by inhalation and ingestion. Strong irritant to tissue.

Uses: Organic synthesis; military poison gas.

Shipping regulations: (Rail) Poison gas label. Not accepted by express. (Air) Not acceptable. Legal label name: diphosgene.

trichloromethyl ether $\text{CHCl}_2\text{OCH}_2\text{Cl}$.

Properties: Liquid. Pungent odor. Sp. gr. 1.5066 (10°C); b.p. $130-132^\circ\text{C}$. Soluble in alcohol, benzene, and ether; insoluble in water.

Hazard: Strong irritant to eyes and skin; evolves lachrymatory fumes.

N-(trichloromethylmercapto)-tetrahydrophthalimide.

See captan.

trichloromethylphenylcarbinyl acetate (alpha-(trichloromethyl)benzyl acetate) $\text{C}_6\text{H}_5\text{CH}(\text{CCl}_3)\text{OOCCH}_3$.

Properties: White crystalline solid; intense rose odor; m.p. $86-88^\circ\text{C}$. Clearly soluble in 18 parts of 95% alcohol.

Containers: Fiber drums.

Uses: Perfumes; fixative for essential oils and perfumes.

trichloromethylphosphonic acid $\text{CCl}_3\text{PO}(\text{OH})_2$. Strong dibasic acid, soluble in water and alcohol; insoluble in benzene and hexane.

Uses: Catalyst and condensation agent.

1,1,1-trichloro-2-methyl-2-propanol. See chlorobutanol.

trichloromethylsulfenyl chloride (perchloromethyl mercaptan). ClSCCl_3 .

Properties: Yellow, oil liquid. Disagreeable odor. Mildly decomposed by moist air. Subject to the action of oxidizing agents, reducing agents, chlorine, etc. sp. gr. 1.722 (0°C); b.p. 148–149°C (decomposes); vapor density 6.414; volatility 18,000 mg/cu m (20°C). Insoluble in water. Nonflammable, but supports combustion.

Derivation: Chlorination of carbon disulfide, thiophosgene, or methyl thiocyanate.

Grade: Technical.

Containers: Steel bottles.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to eyes and skin. Tolerance, 0.1 ppm in air.

Uses: Organic synthesis; dye intermediate; fumigant.

Shipping regulations: (Rail, Air) Poison label. Not acceptable on passenger planes. Legal label name perchloromethyl mercaptan.

N-[(trichloromethyl)thio]-4-cyclohexene-1,2-dicarboximide. See captan.

trichloronaphthalene. See chlorinated naphthalene.

trichloronitromethane. See chloropicrin.

trichloronitrosomethane CCl_3NO .

Properties: Dark blue liquid. Unpleasant odor. Slowly decomposes, but is more stable in solution. Soluble in alcohol, benzene, ether; insoluble in water. Sp. gr. 1.5 (20°C); b.p. 5°C (70 mm).

Derivation: Interaction of sulfuric acid, sodium trichloromethylsulfinate, and sodium nitrate.

Grade: Technical.

Hazard: Strong irritant to eyes and tissue.

Uses: Organic synthesis; military poison gas (lachrymator).

trichlorononylsilane. See nonyl trichlorosilane.

trichlorooctadecylsilane. See octadecyltrichlorosilane.

trichlorooctylsilane. See octyl trichlorosilane.

2,4,5-trichlorophenol $\text{C}_6\text{H}_2\text{Cl}_3\text{OH}$.

Properties: Gray flakes in sublimed mass with a strong phenolic odor; sp. gr. (25/4°C) 1.678; b.p. 252°C; m.p. 68–70°C; no flash point. Soluble in alcohol, ether, and acetone. Nonflammable.

Hazard: May cause skin irritation.

Uses: Fungicide, bactericide.

2,4,6-trichlorophenol $\text{C}_6\text{H}_2\text{Cl}_3\text{OH}$. (2,4,6-T).

Properties: Yellow flakes with strong phenolic odor; sp. gr. (25/4°C) 1.675; f.p. 61°C; b.p. 248–249°C; no flash point. Soluble in acetone, alcohol, and ether. Nonflammable.

Hazard: May cause skin irritation.

Use: Fungicide, herbicide, defoliant.

2,4,5-trichlorophenoxyacetic acid (2,4,5-T)

$\text{C}_6\text{H}_2\text{Cl}_3\text{OCH}_2\text{CO}_2\text{H}$.

Properties: Light tan solid; m.p. 151–153°C; soluble in alcohol; insoluble in water; available as sodium and amine salts.

Containers: 50-, and 200-lb drums.

Hazard: Toxic. Tolerance, 10 mg per cubic meter of air. Permitted by EPA for use on rice, range land and rights of way; all other uses cancelled. See also dioxin.

Uses: Plant hormone; herbicide; defoliant.

2-(2,4,5-trichlorophenoxy)ethyl 2,2-dichloropropionate. See erbon.

2-(2,4,5-trichlorophenoxy)propionic acid. See silvex.

2,4,5-trichlorophenyl acetate $\text{C}_6\text{H}_2\text{Cl}_3\text{OOCCH}_3$.

Hazard: May be toxic.

Use: As fungicide, especially on cotton seed.

1,2,3-trichloropropane $\text{CH}_2\text{ClCHClCH}_2\text{Cl}$.

Properties: Colorless liquid; sp. gr. 1.3888 (20/4°C); f.p. –15°C; b.p. 156.17°C; refractive index (n_D²⁰) 1.4822. Flash point (COC) 180°F. Slightly soluble in water; dissolves oils, fats, waxes, chlorinated rubber and numerous resins. Combustible. Autoignition temp. 580°F.

Derivation: Chlorination of propylene.

Hazard: Toxic by inhalation, and skin absorption. Strong irritant. Tolerance, 50 ppm in air.

Uses: Paint and varnish remover; solvent; degreasing agent.

trichlorosilane

(1) SiHCl_3 (silicichloroform).

Properties: Colorless, volatile liquid; sp. gr. 1.336; f.p. –127°C; b.p. 32°C; refractive index 1.3990. Soluble in benzene, ether, heptane, perchloroethylene; decomposed by water. Flash point 7°F.

Containers: To 55-gal drums.

Hazard: Flammable, dangerous fire risk. Moderately toxic.

Use: Laboratory synthesis of organic silanes (trimethyl silane and triphenyl silane).

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

(2) Generic name for compounds of the formula RSiCl_3 of which methyl trichlorosilane, CH_3SiCl_3 , is most important.

N,N',N''-trichloro-2,4,6-triamine-1,3,5-triazine. See trichloromelamine.

2,4,6-trichloro-1,3,5-triazine. See cyanuric chloride.

1,3,5-trichloro-s-triazine-2,4,6-trione. See trichloroisocyanuric acid.

trichlorotrifluoroacetone (1,1,3-trichloro-1,3,3-trifluoroacetone) $\text{CCl}_2\text{FCOCClF}_2$.

Properties: Colorless liquid; b.p. 84.5°C; f.p. below –78°C. Soluble in all proportions with water and most organic solvents. Stable to acid but not alkalis. Nonflammable.

Hazard: Strong irritant to eyes.

Uses: Solvent in acid media; complexing agent.

1,1,2-trichloro-1,2,2-trifluoroethane (trifluorotrichloroethane) $\text{CCl}_2\text{FCClF}_2$.

Properties: Colorless, nearly odorless, volatile liquid. B.p. 47.6°C; f.p. –35°C; critical pressure 33.7 atm; sp. gr. 1.42 (25°C). Noncombustible.

Derivation: From perchloroethylene and hydrofluoric acid.

Grades: Technical; spectrophotometric.

Containers: Drums.

Hazard: Tolerance, 1000 ppm in air.

Uses: Dry-cleaning solvent; fire extinguishers; refrigerant; air-conditioning units; to make chlorotrifluoro-

ethylene; blowing agent; polymer intermediate; solvent drying; drying electronic parts and precision equipment.

tricholine citrate (tris(2-hydroxyethyl)trimethylammonium citrate) $[(CH_3)_3NCH_2CH_2OH]_3 \cdot C_6H_5O_7$.

Containers: Carboys (65% solution); drums.

Uses: Medicine; nutrition.

"Triclene."²⁸ Trademark for trichloroethylene (q.v.). Available in five grades.

tricobalt tetroxide. See cobalto-cobaltic oxide.

"Tricoloid."³⁰¹ Trademark for tricyclamol chloride (q.v.).

tricosane $CH_3(CH_2)_{21}CH_3$.

Properties: Glittering leaflets. Soluble in alcohol; insoluble in water. Sp. gr. 0.779 (48°C); b.p. 234°C (15 mm); m.p. 48°C. Combustible.

Grade: Technical.

Containers: Bottles; fiber containers.

Use: Organic synthesis.

n-tricosanoic acid $CH_3(CH_2)_{21}COOH$. A saturated fatty acid not normally found in natural fats or oils. Synthetic compound is a white crystalline solid; m.p. 79.1°C. Purified product is used in medical research and as reference standard for gas chromatography.

tri-meta, para-cresyl borate $(CH_3C_6H_4)_3BO_3$.

Properties: Light amber liquid; sp. gr. 1.065 (25°C); b.p. 385–395°C; refractive index 1.5480 (24°C); flash point 240°F (COC). Soluble in all proportions in acetone, benzene, chloroform, hydrolyzes on contact with H_2O . Combustible.

Containers: 55-gal drums.

Hazard: Moderately toxic.

Uses: Plasticizer; organic synthesis.

tricresyl phosphate (tritoyl phosphate; TCP)

$(CH_3C_6H_4O)_3PO$. A mixture of isomers.

Properties: Practically colorless, odorless liquid. Stable, nonvolatile. B.p. 420°C; refractive index 1.556 (25°C); sp. gr. 1.162 (25/25°C); wt/gal 9.7 lb; crystallizing point below -35°C. Miscible with all the common solvents and thinners, also with vegetable oils; insoluble in water. Flash point 437°F; autoignition temp. 770°F. Combustible.

Derivation: From cresol and phosphorus oxychloride. Containers: 1-, 5-, 55-gal drums; tank cars.

Hazard: Moderately toxic by ingestion and skin absorption. The ortho isomer is highly toxic; its tolerance is 0.1 mg per cubic meter of air.

Uses: Plasticizer for polyvinyl chloride, polystyrene, nitrocellulose; fire retardant for plastics; air filter medium; solvent mixtures; waterproofing; additive to extreme pressure lubricants; hydraulic fluid and heat exchange medium.

tricresyl phosphite $(CH_3C_6H_4O)_3P$.

Properties: Colorless liquid; slight phenolic odor. B.p. (0.11 mm) 191°C; sp. gr. (20/4°C) 1.115; flash point (open cup) 440°F. Insoluble in water; miscible with acetone, alcohol, benzene, ether, and kerosene. Combustible.

Grade: Technical.

Uses: Stabilizer and plasticizer for plastics and resins.

tricyanic acid. See cyanuric acid.

tricyclamol chloride

$C_6H_{11}C(C_6H_5)(OH)CH_2CH_2C_6H_5N \cdot CH_3Cl$. 1-Cyclohexyl-1-phenyl-3-pyrrolidino-1-propanol methylchloride.

Properties: White, extremely bitter, crystalline powder; faint characteristic odor; soluble in alcohol and in water.

Use: Medicine.

Use: Medicine.

tricyclic. An organic compound comprised of three (only) ring structures, which may be the same or different, e.g., anthracene.

sym-tricyclodecane. See adamantane.

tricyclohexyl borate. See boric acid ester.

n-tridecane $CH_3(CH_2)_{11}CH_3$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water. Sp. gr. 0.755 (20/4°C); b.p. 225.5°C; f.p. -5.45°C; refractive index 1.4250 (20/D); flash point 175°F. Combustible; low toxicity.

Grades: 95%; 99%; research.

Containers: Glass bottles; 1-, 5-gal drums.

Uses: Organic synthesis; distillation chaser.

n-tridecanoic acid (tridecyclic acid; tridecoic acid) $CH_3(CH_2)_{11}COOH$. A saturated fatty acid usually prepared synthetically.

Properties: Colorless crystals; m.p. 44.5°C; sp. gr. 0.8458 (80/4°C); b.p. 312.4°C, 192.2°C (16 mm); refractive index 1.4328 (50°C). Slightly soluble in water; soluble in alcohol and ether. Combustible; low toxicity.

Grade: 99% pure.

Uses: Organic synthesis; medical research.

tridecanol. See tridecyl alcohol.

tridecoic acid. See n-tridecanoic acid.

tridecyl alcohol (tridecanol). A commercial mixture of isomers of the formula $C_{12}H_{25}CH_2OH$.

Properties: Low-melting white solid with pleasant odor; b.p. 274°C; m.p. 31°C; sp. gr. (20/20°C) 0.845; wt/gal 7.0 lb; flash point (TOC) 180°F. Combustible; low toxicity.

Derivation: Oxo process (q.v.) from C_{15} hydrocarbons.

Grade: Technical.

Containers: 55-gal drums; tank cars.

Uses: Esters for synthetic lubricants; detergents; anti-foam agent; other tridecyl compounds; perfumery.

tridecylbenzene (1-phenyltridecane) $C_6H_5(CH_2)_{12}CH_3$.

Properties: Colorless liquid; sp. gr. 0.85–0.86 (60/60°F); refractive index 1.4815–1.4830. Combustible.

Use: Detergent intermediate.

tridecyclic acid. See n-tridecanoic acid.

tri(decyl) orthoformate $CH(OC_{10}H_{21})_3$.

Properties: Liquid; b.p. 194°C; f.p. -15 to -20°C; refractive index 1.448; insoluble in water; soluble in benzene, naphtha, ether, and alcohol.

Use: To remove small quantities of water from ethers or other solvents where acid catalysts can be employed.

tri(decyl) phosphite $(C_{10}H_{21}O)_3P$.

Properties: Water-white liquid; decyl alcohol odor; sp. gr. 0.892 (25/15.5°C); m.p. less than 0°C; refractive index 1.4565 (25°C). Flash point 455°F. Combustible.

Containers: 55-gal drums.

Uses: Chemical intermediate; stabilizer for polyvinyl and polyolefin resins.

tri(hexethyl) chloride

$C_6H_{11}C(C_6H_5)(OH)CH_2CH_2N(C_2H_5)_2 \cdot C_2H_5Cl$. (3-Diethylamino-1-phenyl-1-cyclohexylpropanol ethochloride).

Properties: White, odorless, crystalline powder, bitter taste. Freely soluble in water, in methanol, in chloro-

form, and in alcohol. Practically insoluble in ether and in acetone. Melting range 198–202°C.

Grade: N.F.

Use: Medicine.

2,4,6-tri(dimethylaminomethyl)phenol

$[(CH_3)_2NCH_2]_3C_6H_2OH$.

Properties: Liquid; refractive index 1.5181. Combustible.

Hazard: May be toxic.

Uses: Antioxidants, acid neutralizers, stabilizers, and catalysts for epoxy and polyurethane resins.

tri(dimethylphenyl)phosphite (trixylenyl phosphate)

$[(CH_3)_2C_6H_3O]_3PO$.

Properties: Liquid. Sp. gr. 1.155; refractive index 1.5535; b.p. (10 mm), 243–265°C; flash point 450°F; solubility in water (85°C), 0.002% by weight. Combustible.

Use: Plasticizer.

"Tridione."³ Trademark for trimethadione, U.S.P.

tridodecyl amine. See trilauryl amine.

tridodecyl borate. See boric acid ester.

tridymite SiO_2 . A vitreous, colorless or white, native form of pure silica. Found variously but not so commonly as quartz (q.v.). Quartz will change into tridymite with a 16.2% increase in volume at 870°C. Unlike quartz, it is soluble in boiling sodium carbonate solution. Sp. gr. 2.28–2.3; Mohs hardness 7.

triflazine. Generic name for 2-chloro-4-diethylamino-6-ethylamino-s-triazine $ClC_3N_3[N(C_2H_5)_2]NHC_2H_5$.

Properties: Solid; practically insoluble in water.

Uses: Herbicide; plant growth regulator.

"Tri-Ethane."¹⁷⁷ Trademark for 1,1,1-trichloroethane (q.v.).

triethanolamine (TEA; tri(2-hydroxyethyl)amine)

$(HOCH_2CH_2)_3N$.

Properties: Colorless, viscous, hygroscopic liquid with slight ammoniacal odor; m.p. 21.2°C; b.p. 335°C (dec); vapor pressure <0.01 mm (20°C); sp. gr. 1.126; flash point (open cup) 375°F; wt/gal 9.4 lb; miscible with water, alcohol; soluble in chloroform; slightly soluble in benzene and ether; slightly less alkaline than ammonia. Commercial product contains up to 25% diethanolamine and up to 5% monoethanolamine. Combustible; low toxicity.

Derivation: Reaction of ethylene oxide and ammonia.

Grades: Technical; regular; 98%; U.S.P.

Containers: Drums; tank cars.

Uses: Fatty acid soaps used in drycleaning, cosmetics, household detergents, and emulsions; wool scouring; textile antifume agent and water-repellent; dispersion agent; corrosion inhibitor; softening agent, humectant, and plasticizer; insecticide; chelating agent; rubber accelerator.

triethanolamine lauryl sulfate

$(HOC_2H_4)_3NOS(O)_2OC_{12}H_{25}$. A liquid or paste.

Containers: Drums, tank cars; tank trucks.

Uses: Detergent; wetting, foaming and dispersing agent for industrial, cosmetic and pharmaceutical applications, especially shampoos.

triethanolamine methanearsonate

$CH_3As(O)[ONH(C_2H_4OH)]_2$.

Hazard: Highly toxic by ingestion.

Use: Herbicide.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

triethanolamine oleate. See trihydroxyethylamine oleate.

triethanolamine stearate. See trihydroxyethylamine stearate.

triethanolamine titanate. See titanium chelate.

1,1,3-triethoxyhexane

$CH(OC_2H_5)_2CH_2CH(OC_2H_5)C_3H_7$.

Properties: Colorless liquid; sp. gr. 0.8746 (20/20°C); b.p. 133°C (50 mm); f.p. –100°C; wt/gal 7.3 lb; flash point 210°F. Insoluble in water. Combustible. Low toxicity.

Use: Synthesis of aldehydes, acids, esters, chloride, amines, etc.

triethoxymethane. See triethyl orthoformate.

1,1,3-triethoxy-3-methoxypropane (triethylmethyl malonaldehyde diacetal)

$(CH_3O)(C_2H_5O)CHCH_2CH(OC_2H_5)_2$.

Properties: Colorless liquid. Sp. gr. (25/4°C), 0.9300; b.p. (6 mm) 86°C. Combustible.

Grade: 99%.

Uses: Intermediate; crosslinking and insolubilizing agent.

triethylaconitate

$C_2H_5OOCCHC(COOC_2H_5)CH_2COOC_2H_5$.

Properties: Liquid. Sp. gr. (25°C) 1.096; refractive index (26°C) 1.4517; b.p. (5 mm) 154–156°C. Combustible.

Use: Plasticizer.

triethylaluminum (ATE; TEA; aluminum triethyl).

$(C_2H_5)_3Al$.

Properties: Colorless liquid; sp. gr. 0.837; f.p. –52.5°C; b.p. 194°C; specific heat 0.527 (91.4°F). Miscible with saturated hydrocarbons. Flash point –63°F.

Derivation: By introduction of ethylene and hydrogen into an autoclave containing aluminum. The reaction proceeds under moderate temperature and varying pressures.

Grades: 88–94%.

Containers: Cylinders.

Hazard: Highly toxic; destructive to tissue. Flammable, dangerous fire risk; ignites spontaneously in air; reacts violently with water, acids, alcohols, halogens, and amines.

Uses: Catalyst intermediate for polymerization of olefins, especially ethylene; pyrophoric fuels; production of alpha-olefins and long chain alcohols; gas plating of aluminum.

Shipping regulations: (Rail) Red label. (Air) Not acceptable. (Rail) Legal label name; aluminum triethyl.

triethylamine $(C_2H_5)_3N$.

Properties: Colorless liquid; strong ammoniacal odor. B.p. 89.7°C; f.p. –115.3°C; sp. gr. (20/20°C) 0.7293; wt/gal (20°C) 6.1 lb; flash point (open cup) 20°F. Soluble in water and alcohol.

Derivation: From ethyl chloride and ammonia under heat and pressure.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 1.2 to 8.0%. Tolerance, 25 ppm in air. Toxic by ingestion and inhalation; strong irritant to tissue.

Uses: Catalytic solvent in chemical synthesis; accelerator activators for rubber; wetting, penetrating and waterproofing agents of quaternary ammonium

types; curing and hardening of polymers (e.g., core-binding resins); corrosion inhibitor; propellant. Shipping regulations: (Rail) Flammable liquids, n.o.s., Red label. (Air) Flammable Liquid label.

triethylborane (triethylborine; boron triethyl). $(C_2H_5)_3B$.

Properties: Colorless liquid. Sp. gr. (25°C); flash point $-32^\circ F$; f.p. $-93^\circ C$; b.p. $95^\circ C$; refractive index 1.3971; heat of combustion 20,000 Btu/lb. Miscible with most organic solvents; immiscible with water.

Derivation: Reaction of triethylaluminum and boron halide, or diborane and ethylene.

Hazard: Flammable, dangerous fire risk. Ignites spontaneously in air. Highly toxic by inhalation; strong irritant. Reacts violently with water and oxidizing materials.

Uses: Igniter or fuel for jet and rocket engines; fuel additive; olefin polymerization catalyst; intermediate.

Shipping regulations: (Rail) Pyrophoric liquid, n.o.s., Red label. (Air) Not acceptable.

triethyl borate (ethyl borate) $(C_2H_5)_3BO_3$.

Properties: Colorless liquid; mild odor. Hydrolyzes rapidly, depositing boric acid in finely divided crystalline form. B.p. $120^\circ C$; sp. gr. 0.863–0.864 (20/20°C); flash point $51.8^\circ F$ (C.C.); wt/gal 7.20 lb. (20°C); refractive index 1.37311 (20°C).

Uses: Antiseptics; disinfectants; antiknock agent.

Hazard: Flammable, dangerous fire risk. Moderately toxic.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label. (Air) Legal label name, ethyl borate.

triethylborine. See triethylborane.

triethyl citrate (ethyl citrate) $C_3H_5(COOC_2H_5)_3$.

Properties: Colorless, mobile liquid. Bitter taste; b.p. $294^\circ C$; b.p. (1 mm) 126 – $127^\circ C$; sp. gr. 1.136 (25°C); refractive index 1.4405 (24.5°C); pour point $-50^\circ F$; solubility in water 6.5 g/100 cc; solubility in oil 0.8 g/100 cc. Flash point $303^\circ F$ (COC); combustible. Low toxicity.

Derivation: Esterification of citric acid.

Grades: Technical; refined; F.C.C.

Containers: Metal drums and cans; tank cars.

Uses: Solvent and plasticizer for nitrocellulose and natural resins; softener; paint removers; agglutinant; perfume base; food additive (not over 0.25%).

triethylenediamine $N(CH_2CH_2)_3N$. Catalyst used in the production of polyurethanes. Combustible.

triethylene glycol (TEG) $HO(C_2H_4O)_3H$.

Properties: Colorless, hygroscopic, practically odorless liquid. Sp. gr. 1.1254 (20/20°C); b.p. $287.4^\circ C$; vapor pressure less than 0.01 mm (20°C); flash point $350^\circ F$ (C.C.); wt/gal 9.4 lb (20°C); freezing point $-7.2^\circ C$; viscosity 0.478 poise (20°C). Autoignition temp. $700^\circ F$. Soluble in water; immiscible with benzene, toluene and gasoline. Combustible; low toxicity.

Derivation: From ethylene and oxygen, as a by-product of ethylene glycol manufacture.

Grades: Technical; C.P.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Solvent and plasticizer in vinyl, polyester and polyurethane resins; dehydration of natural gas; humectant in printing inks; extraction solvent ("Udex" process).

triethylene glycol diacetate

$CH_3COOCH_2CH_2OCH_2CH_2OCH_2CH_2OOCCH_3$.

Properties: Colorless liquid. Sp. gr. (25°C) 1.112; re-

fractive index n (25°C) 1.437; b.p. $300^\circ C$; f.p. less than $-60^\circ C$. Combustible; low toxicity.

Use: Plasticizer.

triethylene glycol dibenzoate

$C_6H_5CO(OCH_2CH_2)_3OOC C_6H_5$.

Properties: Crystals; b.p. 210 – $223^\circ C$; m.p. $46^\circ C$; flash point $457^\circ F$ (TOC); sp. gr. 1.168. Combustible. Low toxicity.

Uses: Plasticizer for vinyl resins; adhesives.

triethylene glycol dicaprylate (triethylene glycol dioctoate) $C_7H_{15}COO(CH_2CH_2O)_3OCC_7H_{15}$.

Properties: Clear liquid; sp. gr. 0.973 (20°C); acidity 0.3% max. (caprylic); moisture 0.05% max; f.p. $-3^\circ C$; b.p. $243^\circ C$ (5 mm). Soluble in most organic solvents. Combustible; low toxicity.

Uses: Low-temperature plasticizer for elastomers.

triethylene glycol dichloride. See triglycol dichloride.

triethylene glycol didecanoate

$C_9H_{19}COO(C_2H_4O)_3OCC_9H_{19}$.

Properties: Colorless liquid. B.p. $237^\circ C$ (2.0 mm); sp. gr. 0.9584 (20/20°C); viscosity 28.6 cp (20°C). Combustible. Low toxicity.

Use: Plasticizer.

triethylene glycol di(2-ethylbutyrate)

$C_5H_{11}OCOCH_2(CH_2OCH_2)_2CH_2OCOC_5H_{11}$.

Properties: Light-colored liquid; sp. gr. 0.9946 (20/20°C); 8.3 lb/gal (20°C); b.p. $196^\circ C$ (5 mm); vapor pressure 5.8 mm Hg (200°C); solubility in water 0.02% by wt (20°C); viscosity 10.3 cp (20°C). Flash point $385^\circ F$. Combustible. Low toxicity.

Use: Plasticizer.

triethylene glycol di(2-ethylhexoate)

$C_7H_{15}OCOCH_2(CH_2OCH_2)_2CH_2OCOC_7H_{15}$.

Properties: Light-colored liquid; sp. gr. 0.9679 (20/20°C); 8.1 lb/gal (20°C); b.p. $219^\circ C$ (5 mm); vapor pressure 1.8 mm Hg (200°C); insoluble in water; viscosity 15.8 cp (20°C). Flash point $405^\circ F$. Combustible. Low toxicity.

Use: Plasticizer.

triethylene glycol dihydroabietate

$C_{19}H_{31}COO(C_2H_4O)_3OCC_{19}H_{31}$.

Properties: Liquid. Sp. gr. (25°C) 1.080–1.090; refractive index (20°C) 1.5180; vapor pressure (225°C) 2.5; flash point $226^\circ C$; insoluble in water. Combustible. Low toxicity.

Use: Plasticizer.

triethylene glycol dimethyl ether

$CH_3(OCH_2CH_2)_3OCH_3$.

Properties: Water-white liquid; mild ether odor; sp. gr. (20/20°C) 0.9862; refractive index 1.4233 (n_D 20/D); flash point $232^\circ F$; b.p. (760 mm) $216.0^\circ C$; (100 mm) $153.6^\circ C$; f.p. $-46^\circ C$. Autoignition temp. $1166^\circ F$. Completely soluble in water and hydrocarbons at 20°C. May contain peroxides. Combustible. Low toxicity.

Containers: Glass bottles; cans; 55-gal drums.

Uses: Solvent for gases; coupling immiscible liquids.

triethylene glycol dioctoate. See triethylene glycol dicaprylate.

triethylene glycol dipelargonate

$C_8H_{17}COO(C_2H_4O)_3OCC_8H_{17}$.

Properties: Clear liquid; sp. gr. 0.964 (20/20°C); b.p. $251^\circ C$ (5 mm); f.p. $+1$ to $-4^\circ C$; refractive index 1.4470 (23°C); flash point $410^\circ F$. Almost insoluble in water; soluble in most organic solvents. Combustible. Low toxicity.

Use: Plasticizer.

triethylene glycol dipropionate

$C_2H_5CO(OCH_2CH_2)_3OOC C_2H_5$.

Properties: Colorless liquid. Sp. gr. (25°C) 1.066; refractive index (25°C) 1.436; b.p. (2 mm) 138–142°C; f.p. less than –60°C; solubility in water, 6.70% by weight. Combustible. Low toxicity.

Use: Plasticizer.

triethylene glycol monobutyl ether. See butoxytriethylene glycol.**triethylenemelamine** (tretamine; TEM; 2,4,6-tris(1-aziridinyl)-s-triazine)

$NC[N(CH_2)_2]NC[N(CH_2)_2]NC[N(CH_2)_2]$.

Properties: White, crystalline, odorless powder; m.p. 160°C (polymerizes); polymerizes readily with heat or moisture; soluble in alcohol, water, methanol, chloroform, and acetone.

Grade: N.F.

Hazard: Highly toxic.

Uses: Medicine (see nitrogen mustards); insecticide; chemosterilant.

triethylenephosphoramidate (tepa; tris-(1-aziridinyl)phosphine oxide; APO) $(NCH_2CH_2)_3PO$.

Properties: Colorless crystals; m.p. 41°C; soluble in water, alcohol and ether. Combustible.

Derivation: From ethyleneimine.

Hazard: Highly toxic. Strong irritant to skin and tissue.

Uses: Medicine (see nitrogen mustards); insect sterilant. Also used with tetrakis(hydroxymethyl)phosphonium chloride (THPC) to form a condensation polymer suitable for flameproofing cotton. See also tris[1-(2-methyl)aziridinyl]phosphine oxide.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Legal label name: tris(1-aziridinyl)phosphine oxide.

See also tepa.

triethylenetetramine $NH_2(C_2H_4NH)_2C_2H_4NH_2$.

Properties: Moderately viscous yellowish liquid. Less volatile than diethylenetriamine but resembles it in many other properties. Soluble in water. B.p. 277.5°C; sp. gr. 0.9818 (20/20°C); m.p. 12°C; flash point 275°F (C.C.); wt 8.2 lb/gal (20°C). Combustible. Autoignition temp. 640°F.

Grades: Technical; anhydrous.

Containers: Cans; drums; tank cars.

Hazard: Strong irritant to tissue. Causes skin burns and eye damage.

Uses: Detergents and softening agents; synthesis of dyestuffs, pharmaceuticals and rubber accelerators.

Shipping regulations: (Air) Corrosive label.

tri(2-ethylhexyl)phosphate $[C_4H_9CH(C_2H_5)CH_2]_3PO_4$.

Properties: Light-colored liquid; sp. gr. 0.9260 (20/20°C); 7.70 lb/gal (20°C); b.p. 220°C (5 mm); vapor pressure 1.9 mm Hg (200°C); insoluble in water; viscosity 14.1 cp (20°C); pour point –74°C; flash point 405°F. Combustible; low toxicity.

Use: Plasticizer.

tri(2-ethylhexyl) phosphite $(C_8H_{17}O)_3P$.

Properties: Straw-colored liquid; sp. gr. 0.897 (25/15°C); m.p., glass at low temperature; refractive index 1.451 (n_D 25/D); flash point 340°F (COC). Combustible; low toxicity.

Uses: Plasticizer; intermediate.

tri(2-ethylhexyl) trimellitate $C_6H_3(COOC_8H_{17})_3$.

Properties: Clear liquid, mild odor; sp. gr. 0.992 (20/

20°C); distillation range at 3 mm, 278–284°C (5–95%); f.p., a gel at –35°C; refractive index 1.4846 (23°C); wt/gal 8.26 lb (20°C). Combustible; low toxicity.

Use: Plasticizer.

triethylmethane. See 3-ethylpentane.**triethylmethyl malonaldehyde diacetal.** See 1,1,3-triethoxy-3-methoxypropane.**triethyl orthoformate** (triethoxymethane) $CH(OC_2H_5)_3$.

Properties: Colorless liquid; pungent odor; b.p. 145.9°C; refractive index 1.39218 (18.8°C); sp. gr. 0.895 (20/20°C). Soluble in alcohol, ether; decomposes in water. Flash point 86°F (C.C.). Low toxicity.

Derivation: Reaction of sodium ethylate with chloroform or reaction of hydrochloric acid with hydrogen cyanide in ethyl alcohol solution.

Containers: 55-gal steel drums.

Hazard: Flammable, moderate fire risk.

Uses: Organic synthesis; pharmaceuticals.

triethyl phosphate (TEP) $(C_2H_5)_3PO_4$.

Properties: Colorless, high-boiling liquid. Mild odor; very stable at ordinary temperatures. Compatible with many gums and resins. Soluble in most organic solvents; completely miscible in water. When mixed with water is quite stable at room temperature, but at elevated temperatures it hydrolyzes slowly. F.p. –56.4°C; b.p. 216°C, flash point 240°F; refractive index 1.4055 (20°C); wt/gal 8.90 lb (68°F). Combustible.

Grades: Technical; 97%.

Containers: Drums; tank cars; tank trucks.

Hazard: May cause nerve damage but to less extent than other cholinesterase-inhibiting compounds.

Uses: Solvent; plasticizer for resins, plastics, gums; manufacture of pesticides; catalyst; lacquer remover.

Shipping regulations: (Rail, Air) Organic phosphate, liquid, n.o.s., Poison label. Not acceptable on passenger planes.

triethyl phosphite $(C_2H_5)_3PO_3$.

Properties: Colorless liquid; sp. gr. 0.9687 (20°C); b.p. 156.6°C; refractive index 1.413 (n_D 25/D); flash point 130°F; insoluble in water; soluble in alcohol and ether. Combustible.

Containers: Glass bottles; 5-, 55-gal drums.

Hazard: Moderate fire risk. May be toxic.

Uses: Synthesis; plasticizers; stabilizers; lube and grease additives.

O,O,O-triethyl phosphorothioate (triethyl thiophosphate) $(C_2H_5O)_3PS$.

Properties: Colorless liquid with characteristic odor. B.p. (10 mm) 93.5–94°C; sp. gr. 1.074; flash point 225°F (COC); combustible.

Containers: Bottles; drums.

Hazard: Toxic by ingestion; cholinesterase inhibitor.

Uses: Plasticizer; lubricant additive; antifoam agent; hydraulic fluid; intermediate.

Shipping regulations: (Rail, Air) Organic phosphate, liquid, n.o.s., Poison label. Not acceptable on passenger planes.

triethyl tricarballylate $(C_2H_5OCOCH_2)_2CHCOOC_2H_5$.

Properties: Colorless liquid. Sp. gr. (20°C) 1.087; refractive index (26°C) 1.4234; b.p. (5 mm) 158–160°C; solubility in water (20°C) 0.62% by weight. Combustible.

Use: Plasticizer.

"Triexcel."³²² Trademark for rotenone and isomesynergized pyrethrin extracts in concentrate form for insecticidal formulations.

trifluoroacetic acid CF_3COOH .

Properties: Colorless, fuming liquid; hygroscopic; pungent odor. B.p. 72.4°C ; sp. gr. 1.535; f.p. -15.25°C ; index of refraction (n 20/D) 1.2850; very soluble in water. Nonflammable.

Containers: Custom-packed.

Hazard: Probably toxic and irritant to skin.

Uses: Strong non-oxidizing acid; laboratory reagent; solvent; catalyst.

trifluoroamine oxide (F_3NO). A perfluorated amine, obtained by fluorination of nitrosyl fluoride with ultraviolet light or high temperature or pressure. An alternative process is by burning nitric oxide and fluorine, rapidly quenching the gaseous mixture as it leaves the flame zone.

Hazard: Probably toxic.

trifluorochloroethylene. Legal label name (Rail) for chlorotrifluoroethylene (q.v.).

trifluorochloromethane. See chlorotrifluoromethane.

alpha, alpha, alpha-trifluoro-2,6-dinitro-N,N-dipropyl-para-toluidine. See trifluralin.

trifluoromethane. See fluoroform.

trifluoromethylbenzene. See benzotrifluoride.

trifluoromethylhydrothiazide. See hydroflumethiazide.

3-trifluoromethyl-4-nitrophenol (alpha, alpha, alpha-trifluoro-4-nitro-meta-cresol) $\text{CF}_3\text{C}_6\text{H}_3(\text{NO}_2)\text{OH}$.

Properties: Crystals; m.p. $74-76^\circ\text{C}$.

Use: To exterminate lampreys, especially in the Great Lakes. It is placed in tributary streams where it kills the lamprey larvae.

trifluoronitrosomethane CF_3NO .

Properties: Bright blue, fairly stable gas. Disagreeable odor. B.p. -84°C ; f.p. -150°C . Nonflammable.

Derivation: (a) Interaction of fluorine and silver cyanide in the presence of silver nitrate; (b) from nitric oxide and iodotrifluoromethane or bromotrifluoromethane in the presence of ultraviolet light.

Hazard: Strong irritant to mucous membranes and tissue.

Uses: Monomer for nitroso rubber; military poison.

trifluorostyrene $\text{C}_8\text{H}_5\text{F}_3$. A monomer designed for the production of polytrifluorostyrene and for copolymerization with vinyl monomers.

Properties: Liquid; boiling point 68°C ; freezing pt. -23°C ; refractive index 1.474; sp. gr. 1.22; dipole moment 1.98 (D). The polymer is soluble in toluene, chloroform, and methyl ethyl ketone and has dielectric constant of 2.56. Available in laboratory quantities only. Nonflammable.

Uses: Membranes for fuel cells and water purification.

trifluorotrchloroethane. See trichlorotrifluoroethane.

trifluorovinylchloride. See chlorotrifluoroethylene.

triflupromazine hydrochloride (10-(3-dimethylamino-propyl)-2-(trifluoromethyl)phenothiazine hydrochloride) $\text{C}_{15}\text{H}_{19}\text{F}_3\text{N}_3\text{S} \cdot \text{HCl}$.

Properties: White crystalline powder; decomposes $173-174^\circ\text{C}$. Soluble in water, alcohol, acetone; solutions are sensitive to air and light.

Grade: N.D.

Use: Medicine.

trifluralin. Generic name for 1,1,1-trifluoro-2,6-dinitro-N,N-dipropyl-para-toluidine,

$\text{F}_3\text{C}(\text{NO}_2)_2\text{C}_6\text{H}_2\text{N}(\text{C}_3\text{H}_7)_2$.

Properties: Yellowish orange solid; m.p. $48.5-49^\circ\text{C}$; b.p. $139-140^\circ\text{C}$ (4.2 mm). Insoluble in water; soluble in xylene, acetone, and ethanol. Probably low toxicity.

Use: Herbicide; especially for cotton plant.

triformol. See sym-trioxane.

"Trigamine."⁷³ Trademark for buffered aliphatic amine.

Properties: Water-white to pale yellow viscous liquid with a pleasant odor. Soluble in water, ethyl alcohol (50%), glycerin and diethylene glycol. Insoluble in oils and hydrocarbon solvents. Sp. gr. (25°C) 1.17; pH (10% solution) 9.5; neutralization value 208-210. Uses: Solvent and plasticizer for aqueous solutions of casein and shellac; emulsifier for waxes, polishes, etc.

triglyceride. Any naturally occurring ester of a normal acid (fatty acid) and glycerol. The chief constituents of fats and oils, they have the general formula: $\text{CH}_2(\text{OOCR}_1)\text{CH}(\text{OOCR}_2)\text{CH}_2(\text{OOR}_3)$, where R_1 , R_2 , and R_3 are usually of different chain length. Refining processes often yield commercial products in which the R chain lengths are the same.

Derivation: Extraction from animal, vegetable and marine matter.

Uses: Fatty acids and derivatives; manufacture of edible oils and fats; manufacture of monoglycerides.

triglycerol monolinolenate. See polyglycerol ester.

triglycerol trilineoleate. See polyglycerol ester.

triglycine. See nitrilotriacetic acid.

triglycol dichloride (triethylene glycol dichloride)

$\text{Cl}(\text{C}_2\text{H}_4\text{O})_2\text{C}_2\text{H}_4\text{Cl}$.

Properties: Colorless liquid; sp. gr. 1.1974 ($20/20^\circ\text{C}$); b.p. 241.3°C ; flash point 250°F ; wt/gal 10.0 lb (20°C); freezing point -31.5°C . Insoluble in water. Combustible. Low toxicity.

Grade: Technical.

Containers: Cans; drums.

Uses: Solvent for hydrocarbons, oils, etc; extractant; intermediate for resins and insecticides; organic synthesis.

triglycollamic acid. See nitrilotriacetic acid.

trigonelline (coffearine; caffeine; gynesine)

$\text{C}_8\text{H}_9\text{NCOOCH}_3 \cdot \text{H}_2\text{O}$. N-Methylnicotinic acid betaine. A base formed in the seeds of many plants.

Properties: Colorless prisms; m.p. 218°C (dec); very soluble in water; soluble in alcohol; nearly insoluble in ether, benzene, and chloroform.

Derivation: Plant seeds; coffee beans; synthetically by heating nicotinic acid with methyl iodine and treatment with silver oxide.

Use: Biochemical research.

tri-n-hexylaluminum $(\text{C}_6\text{H}_{13})_3\text{Al}$.

Properties: Colorless pyrophoric liquid; b.p. (0.001 mm) 105°C .

Derivation: Exchange reaction between hexene and isobutyl aluminum.

Hazard: Toxic; ignites at room temperature.

Use: Polyolefin catalyst.

Shipping regulations: Pyrophoric liquids, n.o.s., Red label. (Air) Not acceptable.

trihexylene glycol diborate $(\text{C}_6\text{H}_{12}\text{O}_2)_2\text{B}_2$. A cyclic borate.

Properties: Colorless liquid; sp. gr. 0.982 (21°C); boiling range $314-326^\circ\text{C}$; refractive index 1.4375 (25°C); flash point 345°F . Soluble in most organic

solvents; hydrolyzes slowly in water. Combustible. Low toxicity.

Derivation: Reaction of hexylene glycol with boric oxide.

Containers: 55-gal drums.

Uses: Gasoline additive; chemical intermediate.

trihexyl phosphite ($C_6H_{13}O_3P$).

Properties: Mobile, colorless liquid with characteristic odor; sp. gr. 0.897 (20/4°C); b.p. 135–141°C (0.2 mm); flash point 320°F (COC). Miscible with most common organic solvents; insoluble in water; hydrolyzes very slowly. High degree of thermal stability. Exposure to air should be minimum. Combustible. Low toxicity.

Containers: 5-gal, 55-gal steel drums.

Uses: Intermediate for insecticides; component of vinyl stabilizers; lubricant additive; specialty solvent.

trihydric. Any alcohol in which three hydroxyl groups are present. See also polyol; glycerol.

1,2,3-trihydroxyanthraquinone. See anthragallol.

1,2,4-trihydroxyanthraquinone. See purpurin.

1,2,7-trihydroxyanthraquinone. See anthrapurpurin.

1,2,3-trihydroxybenzene. See pyrogallol.

1,3,5-trihydroxybenzene. See phloroglucinol.

3,4,5-trihydroxybenzoic acid. See gallic acid.

2,4,5-trihydroxybutyrophenone $C_6H_2(OH)_3COC_3H_7$.

Properties: Yellow-tan crystals; m.p. 149–153°C; density 6.0 lb/gal (20°C). Very slightly soluble in water; soluble in alcohol and propylene glycol. Non-toxic.

Use: Antioxidant for polyolefins and paraffin waxes; food additive.

tri(2-hydroxyethyl)amine. See triethanolamine.

trihydroxyethylamine oleate (triethanolamine oleate) $(HOCH_2CH_2)_3N \cdot HOOC_{17}H_{33}$. Surfactant made by reaction of triethanolamine with oleic acid. Combustible.

Use: Emulsifying agent.

trihydroxyethylamine stearate (triethanolamine stearate) $(HOCH_2CH_2)_3N \cdot HOOC_{17}H_{35}$.

Properties: Cream-colored, wax-like solid. Faint fatty odor. Soluble in methyl alcohol, ethyl alcohol, mineral oil, vegetable oil. Dispersible in hot water. Sp. gr. 0.968; pH (25°C) 8.8–9.2 (5% aqueous dispersion); m.p. 42–44°C. Combustible; low toxicity.

Containers: 1-, 5-gal cans; 50-gal drums.

Uses: Emulsifying agent for cosmetic and pharmaceutical industries.

tri(hydroxymethyl)aminomethane. See tris(hydroxymethyl)aminomethane.

1,3,8-trihydroxy-6-methylanthraquinone. See emodin.

2,4,6-trihydroxytoluene. See methylphloroglucinol.

triidebenzoic acid. A hormone-like synthetic used to increase yields of plants when applied in the flowering stage.

triiodomethane. See iodoform.

triiodothyronine (liothyronine)

$HOC_6H_3IOC_6H_2I_2CH_2CH(NH_2)COOH$.

3,5,3'-Triiodothyronine. Either a derivative or precursor of thyroxine (q.v.). Triiodothyronine increases

the metabolic rate and oxygen consumption of animal tissues. Low toxicity at normal dosage.

Use: Biochemical research; medicine (metabolic insufficiency).

triisobutylaluminum (TIBAL) $[(CH_3)_2CHCH_2]_3Al$.

Properties: Colorless liquid; sp. gr. 0.7876 (20°C); f.p. –5.6°C; b.p. 114°C (30 mm). Flash point below 32°F; autoignition temp. below 39°F.

Derivation: Reaction of isobutylene and hydrogen with aluminum under moderate temperature and varying pressures.

Hazard: Flammable, dangerous fire risk; ignites spontaneously in air; reacts violently with water, acids, alcohols, amines, and halogens. Highly toxic; destroys tissue.

Uses: Polyolefin catalyst; manufacture of primary alcohols and olefins; pyrophoric fuel.

Shipping regulations: (Rail) Pyrophoric liquid, n.o.s., Red label. (Air) Not acceptable.

triisobutylene. A mixture of isomers of the formula $(C_4H_8)_3$ readily prepared by polymerizing isobutylene. A typical mixture is 2,2,4,6,6-pentamethylheptane-3 and 2-neopentyl-4,4-dimethylpentene-1. May be depolymerized to simpler isobutylene derivatives.

Properties: Liquid. Sp. gr. 0.764 (60°F); boiling range 348–354°F. Combustible; low toxicity.

Containers: 55-gal drums; tank cars.

Uses: Synthesis of resins, rubbers, and intermediate organic compounds; lubricating oil additive, raw material for alkylation in producing high octane motor fuels.

triisooctyl phosphite ($C_8H_{17}O_3P$).

Properties: Colorless liquid with characteristic odor. Miscible with most common organic solvents; insoluble in water. Hydrolyzes very slowly. Exposure to air should be minimum. High thermal stability. Sp. gr. 0.891 (20/4°C); b.p. 161–164°C (0.3 mm); flash point 385°F (COC). Combustible.

Containers: 5-gal, 55-gal steel drums.

Uses: Intermediate for insecticides; component of vinyl stabilizers; lubricant additive; specialty solvent.

O,O,O-triisooctyl phosphorothioate (triisooctyl thiophosphate) $(C_8H_{17}O)_3PS$.

Properties: Colorless liquid with characteristic odor. B.p. (0.2 mm) 160–170°C; sp. gr. 0.933; flash point (COC) 410°F. Insoluble in water; soluble in most organic solvents. Combustible.

Containers: Bottles; drums.

Hazard: Toxic, with nerve damage. Cholinesterase inhibitor.

Uses: Plasticizer; lubricant additive; hydraulic fluid; intermediate.

Shipping regulations: (Rail, Air) Organic phosphates, liquid, n.o.s., Poison label. Not acceptable on passenger planes.

triisooctyl trimellitate $C_6H_3(COOC_8H_{17})_3$.

Properties: Clear liquid; mild odor; sp. gr. 0.992 (20/20°C); distillation range 272–286°C (5–95%); f.p. gel at –45°C; refractive index 1.4852 (23°C). Practically insoluble in water. Combustible; low toxicity.

Use: Plasticizer.

triisopropanolamine $N(C_3H_7OH)_3$.

Properties: Crystalline white solid. Mild base. (A mixture of isopropanolamines which has sp. gr. of 1.004–1.010 and is liquid at room temperature is also marketed). Sp. gr. 0.9996 (50/20°C); m.p. 45°C;

b.p. 305°C; vapor pressure <0.01 mm (20°C); melting point 58°C; viscosity 1.38 poise (60°C). Soluble in water. Flash point 320°F. (O.C.). Combustible.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Moderately irritant to skin and eyes.

Use: Emulsifying agents.

triisopropyl borate $[(CH_3)_2CH]_3BO_3$.

Properties: Colorless liquid; b.p. 138–140°C. f.p. –59°C; sp. gr. 0.8138; flash point 82°F (TCC).

Derivation: Reaction of isopropyl alcohol with boric oxide.

Hazard: Flammable; moderate fire risk. Moderately toxic.

triisopropyl phosphite $[(CH_3)_2CH]_3PO_3$.

Properties: Colorless liquid, characteristic odor; sp. gr. 0.914 (20/4°C); b.p. 94–96°C (50 mm); flash point 165°F (COC). Miscible with most common organic solvents; insoluble in water. Hydrolyzes slowly in water. Exposure to air should be minimum. High thermal stability. Combustible.

Containers: 55-gal, 5-gal steel drums.

Uses: Intermediate for insecticides; component of vinyl stabilizers; lubricant additive; specialty solvent.

triketohydrindene hydrate. See ninhydrin.

"Trilafon."³²¹ Trademark for perphenazine (q.v.).

trilaurin. The glyceride of lauric acid; glyceryl trilaurate.

trilauryl amine (tridodecyl amine) $(C_{12}H_{25})_3N$. Colorless liquid; sp. gr. 0.82; m.p. 14°C; soluble in organic solvents; insoluble in water. Combustible. Toxicity probably low.

Uses: Chemical intermediate; metal complexes.

trilauryl phosphite $(C_{12}H_{25}O)_3P$.

Properties: Water-white liquid; sp. gr. 0.866 (25/15°C); refractive index 1.456 (n_D 25/D); m.p. below 10°C. Combustible. Toxicity probably low.

Uses: Stabilizer in polymers; chemical intermediate.

trilauryl trithiophosphite $(C_{12}H_{25}S)_3P$.

Properties: Pale yellow liquid; sp. gr. 0.915 (25/15°C); m.p. 20°C; refractive index 1.502 (n_D 25/D); flash point 430°F (COC). Combustible. Toxicity probably low.

Uses: Stabilizer; lubricant; chemical intermediate.

"Triluxe."⁵⁶ Trademark for dry-cleaning solvent consisting of trichloroethylene.

Hazard: See trichloroethylene.

trimagnesium phosphate. See magnesium phosphate, tribasic.

"Tri-Mal."³⁰⁴ Trademark for tribasic lead maleate vinyl stabilizer.

trimedlure. Generic name for tert-butyl 4(or 5)-chloro-2-methylcyclohexanecarboxylate, $H_3C(Cl)C_6H_4COOC(CH_3)_3$.

Properties: Liquid; b.p. 90–92°C (0.6 mm). Soluble in most organic solvents; insoluble in water.

Use: Insect attractant.

trimellitic anhydride (TMA) $HOOC_6H_3COOCO$

1,2,4-Benzenetricarboxylic acid, 1,2-anhydride.

Properties: Solid; m.p. 164–166°C. Combustible.

Derivation: From pseudocumene.

Uses: Plasticizer for polyvinylchloride; alkyd coating resins; high-temperature plastics; wire insulation; gaskets; automotive upholstery.

"Trimene Base."²⁴⁸ Trademark for a reaction product of ethyl chloride, formaldehyde, and ammonia.

Properties: Dark brown, viscous liquid; sp. gr. 1.10; soluble in water and acetone; insoluble in gasoline and benzene.

Uses: Rubber accelerator.

trimer. An oligomer whose molecule is comprised of three molecules of the same chemical composition. Examples are trioxane and tripropylene. See also polymer; dimer.

trimercuric orthophosphate. See mercuric phosphate.

trimercurous orthophosphate. See mercurous phosphate.

trimesoyl trichloride (benzene-1,3,5-tricarboxylic acid chloride) $C_6H_3(COCl)_3$.

Use: Specialty organic.

"Trimet."³¹⁹ Trademark for a trihydric alcohol. See trimethylolethane.

trimethadione (3,5,5-trimethyl-2,4-oxazolidinedione)

C_6H_9NO or $OC(O)N(CH_3)C(O)C(CH_3)_2$.

Properties: White, granular, crystalline substance. Camphor-like odor. M.p. 45–47°C; soluble in water; freely soluble in alcohol, chloroform, and ether; pH (5% solution) about 6.0.

Grade: U.S.P. Toxic in overdose.

Hazard: May have adverse side effects.

Use: Medicine (anticonvulsant).

trimethoxyborine. See trimethyl borate.

trimethoxyboroxine (methyl metaborate) $(CH_3O)_3B_3O_3$. A cyclic compound.

Properties: Colorless liquid; m.p. 10–11°C; b.p. dissociates; sp. gr. 1.216 (25°C); refractive index 1.3986. Nonflammable.

Derivation: Reaction of methyl borate with boric acid. Grade: 99%.

Use: Metal-fire extinguishing fluid.

trimethoxymethane. See methyl orthoformate.

3,4,5-trimethoxyphenethylamine. See mescaline.

2,4,5-trimethoxy-1-propenylbenzene (asarone)

$(CH_3O)_3C_6H_2CH:CHCH_3$. Crystals; m.p. 67°C; insoluble in water; soluble in alcohol. A component of calamus oil and other essential oils. Combustible.

trimethylacethydrazide ammonium chloride. See Girard's T Reagent.

trimethylacetic acid (pivalic acid; neopentanoic acid) $(CH_3)_3CCOOH$.

Properties: Colored crystals; sp. gr. 0.905 (50°C); refractive index 1.3931 (36.5°C); m.p. 35.5°C; b.p. 163.8°C; soluble in water, alcohol and ether. Combustible. Low toxicity.

Uses: Intermediate, as a replacement for some natural materials.

trimethylaluminum (aluminum trimethyl; ATM) $(CH_3)_3Al$.

Properties: Colorless pyrophoric liquid; b.p. 126°C; m.p. 15.4°C; sp. gr. 0.752.

Derivation: By sodium reduction of dimethylaluminum chloride.

Hazard: Highly flammable; dangerous fire risk. Flames instantly on contact with air; reacts violently with water, acids, halogens, alcohols and amines.

Uses: Catalyst for olefin polymerization; pyrophoric fuel; manufacture of straight-chain primary alcohols and olefins; to produce luminous trails in upper atmosphere to track rockets.

Shipping regulations: (Rail) Red label. Legal label name; aluminum trimethyl. (Air) Not acceptable.

trimethyladipic acid. $C_9H_{16}O_4$.

Properties: Powder. Low toxicity. Combustible.

Uses: Esterification agent for plasticizers, lubricants, alkyd resins, polyurethane, polyester, special polyamides; intermediate for the production of glycols.

trimethylamine (TMA) $(CH_3)_3N$.

Properties: Colorless gas at room temperature; readily liquefied. Anhydrous form shipped as liquefied compressed gas. Fishy, ammoniacal odor; sp. gr. 0.662 ($-5^\circ C$); b.p. $-4^\circ C$; f.p. $-117.1^\circ C$; flash point of 25% solution $38^\circ F$. (TOC). Soluble in water, alcohol, and ether. Autoignition temp. $374^\circ F$. Flash point $10^\circ F$ (C.C.)

Derivation: Interaction of methanol and ammonia over a catalyst at high temperature. The mono-, di, and trimethylamines are produced, and yields are regulated by conditions.

Method of separation: Azeotropic or extractive distillation.

Grades: Anhydrous 99% min; aqueous solution 25, 30, 40%.

Containers (Solution): Glass bottles; drums; tank cars (Anhydrous) Cylinders; tank cars.

Hazard: Flammable, dangerous fire risk. Explosive limits in air, 2 to 11.6%. Toxic by inhalation; vapor highly irritating. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Organic synthesis, especially of choline salts; warning agent for natural gas; manufacture of disinfectants; flotation agent; insect attractant; quaternary ammonium compounds; plastics.

Shipping regulations: (Anhydrous) (Rail) Red gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. (Aqueous solution) (Rail) Red label. (Air) Flammable Liquid label.

trimethylamine sulfur trioxide $(CH_3)_3N \cdot SO_3$.

Properties: White powder; m.p. $232-238^\circ C$ (decomp.) soluble in hot water, ethanol. Soluble with difficulty in cold water and acetone. Not dissociated in benzene and chloroform solutions. Distinctly different from the isomeric adduct of trimethylamine oxide and sulfur dioxide.

Uses: Separation of isomers; soil sterilant; catalyst for thermosetting resins.

2,4,5-trimethylaniline. See pseudocumidine.**1,2,3-trimethylbenzene.** See hemimellitene.**1,2,4-trimethylbenzene.** See pseudocumene.**1,3,5-trimethylbenzene.** See mesitylene.**(trimethylbenzyl)dodecyldimethylammonium chloride**

$[(CH_3)_3C_6H_2CH_2N(CH_3)_2C_{12}H_{25}]Cl$. A quaternary ammonium salt.

Properties: White to slightly yellow crystalline powder; mild odor and taste. M.p. $162-163^\circ C$; density 4.62 lbs/gal. Soluble in water, alcohol, glycerin, acetone; pH of 10% solution in distilled water, 4.4.

Use: Germicide.

trimethyl borate (methyl borate; trimethoxyborine)

$(CH_3O)_3B$.

Properties: Water-white liquid. B.p. $67-68^\circ C$; sp. gr. 0.915; f.p. $-29^\circ C$. Miscible with ether, methanol, hexane, tetrahydrofuran; decomposes in presence of water. Flash point about $80^\circ F$; low toxicity.

Derivation: Reaction of boric acid and methanol.

Containers: Truck and car lots.

Hazard: Flammable, fire risk; reacts with water and oxidizing agents.

Uses: Solvent; dehydrating agent; fungicide for citrus fruit; neutron scintillation counters; brazing flux; boron compounds; intermediate.

2,2,3-trimethylbutane (isopropyltrimethylmethane; triptane) $CH_3C(CH_3)_2C(CH_3)CH_3$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water. Sp. gr. 0.691; b.p. $81.0^\circ C$; f.p. $-24.96^\circ C$; refractive index 1.3895 ($20^\circ C$).

Hazard: Flammable, moderate fire risk.

Uses: Organic synthesis; aviation fuel.

trimethyl carbinol. See tert-butyl alcohol.**1,1,3-trimethyl-5-carboxy-3-(p-carboxyphenyl) indane.**

An aromatic di-acid used as intermediate in manufacture of polyester fibers, polyamides, and alkyd resins; hot-melt adhesives; engineering thermoplastics.

trimethylchlorosilane $(CH_3)_3SiCl$.

Properties: Colorless liquid. B.p. $57^\circ C$; sp. gr. 0.854 ($25/25^\circ C$); refractive index ($n_{25/D}$) 1.3893; flash point $-18^\circ F$. Readily hydrolyzed with liberation of hydrochloric acid; soluble in benzene, ether, and perchloroethylene.

Derivation: By Grignard reaction of silicon tetrachloride and methylmagnesium chloride.

Containers: Up to 55-gal drums.

Hazard: Highly flammable; dangerous fire risk. Strong irritant to tissue.

Uses: Intermediate for silicone fluids; as a chain terminating agent; imparting water repellency.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

trimethylcyclododecatiene (TMCDT). A cyclic hydrocarbon. Available in 1, 5, and 55-gallon containers. Intermediate in making derivatives useful in the perfume and pharmaceutical industries, as well as catalysts.**3,3,5-trimethylcyclohexanol-1** $C_6H_8(CH_3)_3OH$.

Properties: Colorless liquid. Sp. gr. 0.878 ($40/20^\circ C$); m.p. $35.7^\circ C$; b.p. $198^\circ C$. Soluble in most organic solvents, hydrocarbons, oils; insoluble in water. Flash point $165^\circ F$ (O.C.) Combustible.

Hazard: Toxic by inhalation. Strong irritant. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Menthol and camphor substitute; antifoaming agent; hydraulic fluids and textile soaps; odor masking; esterification agent; pharmaceuticals; wax additive; printing inks.

3,5,5-trimethyl-2-cyclohexen-1-one. See isophorone.**3,3,5-trimethylcyclohexyl salicylate.** See homomenthyl salicylate.**trimethyl dihydroquinoline polymer (TDQP)** $(C_{11}H_{15}N)_n$ (probably three or more quinoline groups).

Properties: Amber pellets; sp. gr. 1.08; softening point $75^\circ C$. Insoluble in water; miscible with ethanol, acetone, benzene, monochlorobenzene, isopropyl acetate and gasoline.

Uses: Antioxidant; stabilizer or polymerization inhibitor.

3,7,11-trimethyl-1,6,10-dodecatrien-3-ol. See nerolidol.**3,7,11-trimethyl-2,6,10-dodecatrien-1-ol.** See farnesol.**trimethylene.** See cyclopropane.

trimethylene bromide (1,3-dibromopropane)

Properties: Colorless liquid; sweet odor; sp. gr. 1.979 (20/4°C); b.p. 166°C; insoluble in water; soluble in organic solvents; f.p. -34.4°C. Combustible. Low toxicity.

Grades: Technical; C.P.

Containers: Carboys, drums.

Uses: Intermediate for dyestuff and pharmaceutical industries, cyclopropane manufacture.

trimethylene chlorobromide. See 1-bromo-3-chloropropane.**trimethylene chlorohydrin (3-chloro-1-propanol)**

Properties: Colorless to pale yellow liquid; characteristic odor; sp. gr. 1.130-1.150 (25/25°C); refractive index 1.445-1.447 (n_D 25/D). Soluble in water, alcohols and ethers; insoluble in hydrocarbons. Combustible.

Use: Intermediate.

trimethylenedicyanide. See glutaronitrile.**trimethylene glycol (1,3-propylene glycol; 1,3-propanediol)** $\text{CH}_2\text{OHCH}_2\text{CH}_2\text{OH}$

Properties: Colorless, odorless liquid; sp. gr. 1.0537 (25°C); b.p. 210-211°C; soluble in water, alcohol and ether. Combustible. Low toxicity. Autoignition temp. 752°F.

Derivation: From acrolein.

Grades: Technical, 95%; pure, 99%.

Use: Intermediate, especially for polyesters.

trimethylene oxide. See oxetane.**sym-trimethylene trinitramine.** See cyclonite.**trimethylethylene.** See 3-methyl-2-butene.**trimethylglycine.** See betaine.**trimethylheptanoic acid.** See isodecanoic acid.**2,2,5-trimethylhexane** $(\text{CH}_3)_3\text{CCH}_2\text{CH}_2\text{CH}(\text{CH}_3)_2$

Properties: Colorless liquid; f.p. -105.84°C; b.p. 124.06°C; sp. gr. 0.711 (60/60°F); refractive index 1.399 (20/D); flash point 55°F.

Grades: 95%, 99%; research.

Containers: Bottles; drums.

Hazard: Flammable, dangerous fire risk. The 2,3,3-, 2,3,4-, and 3,3,4-isomers are less flammable.

Uses: Synthesis; motor fuel additive.

Shipping regulations: (Rail) Flammable liquids, n.o.s., Red label. (Air) Flammable Liquid label.

3,5,5-trimethylhexan-1-ol $\text{C}_9\text{H}_{20}\text{O}$

Properties: Colorless liquid of mild odor; b.p. 194°C; sp. gr. 0.8236 (25/4°C); wt/gal 6.86 lbs (25°C); refractive index (n_D 25/D) 1.4300; flash point (open cup) 200°F. Insoluble in water. Combustible. Low toxicity.

Derivation: High-pressure synthesis.

Uses: Synthetic lubricants; additives to lubricating oils; wetting agent; softener in manufacture of various plastics; disinfectants and germicides.

trimethylmethane. See isobutane.**trimethyl nitrilotripropionate** $\text{N}(\text{CH}_2\text{CH}_2\text{COOCH}_3)_3$

Properties: Weakly basic tertiary amine and organic ester.

Uses: Plasticizer for PVC; intermediate for pharmaceutical and agricultural chemicals; high-boiling solvents; low-temperature lubricants.

trimethylnonan-1-ol. See 2,6,8-trimethylnonyl-4 alcohol.**2,6,8-trimethyl-4-nonanone (isobutyl heptyl ketone)** $(\text{CH}_3)_2\text{CHCH}_2\text{COCH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}(\text{CH}_3)_2$

Properties: Water-white liquid with pleasant odor; high

solvent power for vinyl resins, the cellulose esters and ethers, and many difficultly soluble substances; insoluble in water; sp. gr. 0.8165 (20/20°C); wt/gal 6.8 lbs (20°C); f.p. -75°C; b.p. 211-219°C; viscosity 1.91 cp (20°C); flash point 195°F (COC). Combustible. Low toxicity.

Uses: Solvent; dispersant; intermediate; lube oil dewaxing.

2,6,8-trimethylnonyl-4 alcohol (trimethylnonanol)

Properties: Colorless liquid with characteristic odor; sp. gr. 0.8913 (20/20°C); wt/gal 6.9 lbs (20°C); b.p. 225.2°C; f.p. -60°C (sets to a glass); viscosity 21.4 cp; flash point 200°F (COC). Insoluble in water. Combustible. Low toxicity.

Derivation: Oxo process.

Uses: Surface-active and flotation agents; lube additives; rubber chemicals.

trimethylolethane (pentaglycerine; methyltrimethylolmethane) $\text{CH}_3\text{C}(\text{CH}_2\text{OH})_3$

Properties: Colorless hygroscopic crystals. Soluble in water and alcohol. Combustible.

Containers: 200-lb drums.

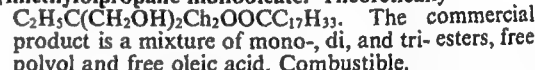

Uses: Conditioning agent; manufacture of varnishes, alkyd and polyester resins, synthetic drying oils.

trimethylolmelamine $\text{C}_3\text{N}_3(\text{NHCH}_2\text{OH})_3$. The first stage in making melamine resins.**trimethylolpropane (hexaglycerol)** $\text{C}_2\text{H}_5\text{C}(\text{CH}_2\text{OH})_3$

Properties: Colorless hygroscopic crystals. Soluble in water and alcohol. Combustible.

Containers: 200-lb drums.

Uses: Conditioning agent; manufacture of varnishes, alkyd resins; synthetic drying oils; urethane foams and coatings; silicone lube oils; lactone plasticizers; textile finishes; surfactants; epoxidation products.

trimethylolpropane monooleate. Theoretically

The commercial product is a mixture of mono-, di, and tri-esters, free polyol and free oleic acid. Combustible.

Properties: Oily liquid; sp. gr. 0.954 (25°C); f.p. less than -20°C. Insoluble in water; soluble in most organic solvents.

Uses: Water-in-oil emulsifier; corrosion inhibitor; low-temperature plasticizer; deicing agent for gasoline.

trimethylolpropane tris(mercaptopropionate)

Properties: Liquid; sp. gr. 1.21 (25°C); refractive index 1.5151 (n_D 25/D). Insoluble in water and hexane; soluble in acetone, benzene and alcohol. Combustible.

Uses: Curing or cross-linking agents for polymers, especially epoxy resins; intermediate for stabilizers and antioxidants.

trimethylolpropane trithioglycolate

Properties: Liquid; sp. gr. 1.28; refractive index 1.5292 (n_D 25/D). Combustible.

Uses: Curing or cross-linking agent for polymeric systems, especially epoxy resins; intermediate for stabilizers and antioxidants.

3,5,5-trimethyl-2,4-oxazolidinedione. See trimethadione.**2,2,4-trimethylpentane.** See isooctane.**2,3,4-trimethylpentane**

Properties: Liquid; f.p. -109.43°C; b.p. 113°C; sp. gr. 0.723 (60/60°F); refractive index 1.4042 (20/D); flash point 41°F.

Grades: 95%, 99%; research.

Containers: Bottles; drums.

Hazard: Flammable, dangerous fire risk.

Uses: Intermediate; azeotropic distillation entrainer.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2,2,4-trimethyl-1,3-pentanediol

$(\text{CH}_3)_2\text{CHCH}(\text{OH})\text{C}(\text{CH}_3)_2\text{CH}_2\text{OH}$.

Properties: (96% pure). White solid; sp. gr. 0.928 (55/15°C); m.p. 46–55°C; b.p. 215–235°C; flash point 235°F. Slightly soluble in water; soluble in alcohol, acetone, ether, and benzene. Combustible.

Containers: Molten in tank cars and trucks.

Uses: Polyester resins, plasticizers, lubricants, surface coatings, and printing inks; insect repellent.

2,2,4-trimethyl-1,3-pentanediol monoisobutyrate

$(\text{CH}_3)_2\text{CHCH}(\text{OH})\text{C}(\text{CH}_3)_2\text{CH}_2\text{OOCCH}(\text{CH}_3)_2$.

Properties: Liquid; sp. gr. 0.945–0.955 (20/20°C); b.p. 180–182°C (125 mm); pour point –57°C; refractive index 1.4423 (n 20/D); flash point 245°F (COC). Insoluble in water; soluble in benzene, alcohol, acetone, and carbon tetrachloride. Combustible.

Use: Intermediate in the manufacture of plasticizers, surfactants, pesticides, and resins.

2,4,4-trimethylpentene-1 (alpha-diisobutylene)

$\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{CH}_2\text{C}(\text{CH}_3)_3$.

Properties: Colorless liquid; b.p. 101.44°C; f.p. –93.5°C; refractive index 1.4086 (20°C); sp. gr. 0.7150 (20°C); flash point 35°F.

Derivation: Polymerization of isobutene.

Grades: 95%; 99%; research.

Containers: Bottles; drums.

Hazard: Flammable, dangerous fire risk.

Uses: Organic synthesis; motor fuel synthesis, particularly isooctane; peroxide reactions.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2,4,4-trimethylpentene-2 (beta-diisobutylene)

$\text{H}_3\text{CC}(\text{CH}_3)_2\text{CHC}(\text{CH}_3)_3$.

Properties: Colorless liquid; b.p. 104.55°C; sp. gr. 0.724 (60/60°F); f.p. –106.4°C; refractive index 1.416 (20/D); flash point 35°F (TOC).

Grade: 95%.

Containers: Bottles; drums.

Hazard: Flammable, dangerous fire risk. May be irritant and narcotic in high concentrations.

Use: Organic synthesis.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

See diisobutylene.

tri-2-methylpentylaluminum $[(\text{CH}_3)_2\text{CH}(\text{CH}_2)_3]_3\text{Al}$

Properties: Colorless liquid.

Derivation: Reaction of 2-methylpentene and isobutylaluminum.

Hazard: Flammable and toxic.

Uses: Polyolefin catalyst.

N,alpha,alpha-trimethylphenethylamine. See mephentermine.

trimethyl phosphate $(\text{CH}_3\text{O})_3\text{PO}$

Properties: Colorless liquid; 22.1% phosphorus; density 1.210 g/ml at 68°F; flash point above 300°F; b.p. 193°C; refractive index (n 20/D) 1.397; pour point –46°C. Soluble in both gasoline and water. Combustible.

Hazard: Toxic by ingestion and inhalation; strong irritant to skin and eyes.

Uses: For controlling spark plug fouling, surface ignition and rumble in gasoline engines.

trimethyl phosphite $(\text{CH}_3\text{O})_3\text{P}$

Properties: Colorless liquid; b.p. 108–108.5°C; pour point, less than –60°C; sp. gr. (20/4°C) 1.046; flash point (COC) 100°F. Insoluble in water, soluble in hexane, benzene, acetone, alcohol, ether, carbon tetrachloride and kerosene.

Hazard: Flammable, moderate fire risk.

Uses: Chemical intermediate, especially for insecticides.

trimethyl phosphorothionate $(\text{CH}_3\text{O})_3\text{PS}$

Properties: Water-white liquid; b.p. 78°C (12 mm).

Containers: 55-gal drums.

Hazard: Probably toxic.

Uses: Extraction of mineral salts from alkyl acid phosphate solvent solutions; plasticizer.

1,2,4-trimethylpiperazine $(\text{CH}_3)_3\text{C}_4\text{H}_7\text{N}_2$

Properties: Colorless liquid; sp. gr. 0.851 (25/25°C); f.p. –44°C; b.p. 151°C; refractive index 1.4480 (n 20/D); flash point 257°F (open cup); miscible in water. Combustible.

Use: Polymerization catalyst.

trimethylpropylmethane. See 2,2-dimethylpentane.

2,4,6-trimethylpyridine. See 2,4,6-collidine.

2,4,6-trimethyl-1,3,5-trioxane. See paraldehyde.

1,3,5-trimethyl-2,4,6-tris(3,5-di-tert-butyl-4-hydroxybenzyl)benzene

Properties: Free-flowing white crystalline powder; m.p. 244°C; no odor; partially soluble in benzene and methylene chloride; insoluble in water. Low toxicity. Combustible. Permissible in contact with food products.

Containers: Fiber drums.

Uses: Antioxidant for polypropylene, high-density polyethylene, spandex fibers, polyamides, and specialty rubbers.

2,6,10-trimethyl-9-undecen-1-al

$(\text{CH}_3)_2\text{C}=\text{CHC}_2\text{H}_4\text{CH}(\text{CH}_3)\text{C}_3\text{H}_6\text{CH}(\text{CH}_3)\text{CHO}$.

Properties: Clear yellow liquid; strong, pungent ozone-like odor; sp. gr. 0.850–0.860 (25/25°C); refractive index 1.4530–1.4630 (20°C). Clearly soluble in 1 part of 90% alcohol; flash point above 212°F (TCC). Combustible; low toxicity.

Use: Perfume.

trimethylvinylammonium hydroxide. See neurine.

trimethylxanthine. See caffeine.

“Trimeton Maleate.”³²¹ Trademark for pheniramine maleate (q.v.).

“Trimulso.”²³⁶ Trademark for a liquid synthetic surfactant used in the preparation of oil-in-water emulsion drilling muds; effective in both fresh water and brine muds.

trimyristin. The glyceride of myristic acid; glyceryl trimyrystate.

trinickelous orthophosphate. See nickel phosphate.

trinitroaniline (picramide) $\text{C}_6\text{H}_2\text{NH}_2(\text{NO}_2)_3$

Properties: Orange-red crystals; m.p. 188°C; b.p. explodes; sp. gr. 1.762.

Derivation: Nitrating aniline in glacial acetic acid solution or by the use of mixed nitric-sulfuric acid in limited amounts.

Hazard: Dangerous; explodes by heat or shock.

Use: Explosive.

Shipping regulations: (Rail) Consult regulations. (Air)

Not acceptable dry, or wet with less than 10% water;

Flammable Solid label when wet with not less than 10% water.

trinitroanisole (methyl picrate; 2,4,6-trinitrophenyl methyl ether) $\text{CH}_3\text{OC}_6\text{H}_2(\text{NO}_2)_3$.

Properties: Crystals; m.p. 68.4°C ; sp. gr. 1.408 ($20/4^\circ\text{C}$).

Hazard: Dangerous; explodes by heat or shock. Highly toxic.

Derivation: Interaction of methyl iodide and silver picrate; nitration of anisic acid.

Shipping regulations: (Rail) Consult regulations. (Air) Not acceptable.

1,3,5-trinitrobenzene (TNB) $\text{C}_6\text{H}_3(\text{NO}_2)_3$.

Properties: Yellow crystals with a sp. gr. of 1.688 ($20/4^\circ\text{C}$); m.p. 122°C ; soluble in alcohol and ether; insoluble in water.

Derivation: From trinitrotoluene by removal of methyl group.

Hazard: Dangerous; explodes by heat or shock.

Use: Explosive.

Shipping regulations: (Rail) Consult regulations. (Air)

Dry, or wet with less than 10% water, Not acceptable.

Wet with not less than 10% water, Flammable Solid label.

2,4,6-trinitrobenzoic acid (trinitrobenzoic acid)

$\text{C}_6\text{H}_2(\text{NO}_2)_3\text{COOH}$.

Properties: Orthorhombic crystals; m.p. 228.7°C ; sublimes with decomposition forming carbon dioxide and trinitrobenzene; slightly soluble in water and benzene; soluble in alcohol, ether, and acetone.

Derivation: Oxidation of 2,4,6-trinitrotoluene with chromic acid.

Hazard: Dangerous; explodes by heat or shock.

Use: Synthesis.

Shipping regulations: (Rail) Consult regulations. (Air)

Dry, or wet with less than 10% water, Not acceptable.

Wet with not less than 10% water, Flammable Solid label.

2,4,6-trinitro-meta-cresol (cresolite; cresylite)

$(\text{NO}_2)_3\text{C}_6\text{H}(\text{CH}_3)\text{OH}$.

Properties: Yellow crystals; m.p. 106°C ; readily soluble in alcohol, ether, and acetone. When heated to decomposition it emits highly toxic fumes of oxides of nitrogen.

Derivation: Prepared from meta-cresol by a process similar to which picric acid is prepared from phenol.

Hazard: Explodes at 300°F . Severe explosion risk when shocked or heated.

Uses: Bursting charges and other high explosive uses.

Shipping regulations: (Rail) Consult regulations (Air) Not acceptable.

trinitroglycerin. See nitroglycerin.

trinitronaphthalene (naphtite) $\text{C}_{10}\text{H}_5(\text{NO}_2)_3$. Commercial preparation is a mixture of isomers which melts about 110°C .

Hazard: Explosion risk when shocked or heated.

Uses: Explosive; stabilizer for nitrocellulose.

Shipping regulations: (Rail) Consult regulations (Air) Not acceptable.

trinitrophenol. See picric acid.

2,4,6-trinitrophenyl methyl ether. See trinitroanisole.

trinitrophenylmethylnitramine. See tetryl.

2,4,6-trinitroresorcinol. See styphnic acid.

2,4,6-trinitrotoluene (TNT; methyltrinitrobenzene)

$\text{CH}_3\text{C}_6\text{H}_2(\text{NO}_2)_3$.

Properties: Yellow, monoclinic needles; sp. gr. 1.654; m.p. 80.9°C ; soluble in alcohol and ether; insoluble in water.

Derivation: Nitration of toluene with mixed acid. Small amounts of the 2,3,4- and 2,4,5-isomers are produced which may be removed by washing with aqueous sodium sulfite solution.

Grade: Technical.

Containers: Wooden cases or kegs; multiwall paper sacks.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Tolerance, 1.5 mg per cubic meter of air. Flammable, dangerous fire risk; moderate explosion risk; will detonate only if vigorously shocked or heated to 450°F .

Uses: Explosive; intermediate in dyestuffs and photographic chemicals.

Shipping regulations: (Rail) (Dry) See regulations for high explosives (Wet, not to exceed 16 oz.) Flammable solid. (Air) Dry, or wet with less than 10% water, Not acceptable. Wet with not less than 10% water, Flammable solid label.

trinitrotrimethylenetriamine. See cyclonite.

trioctadecyl phosphite $(\text{C}_{18}\text{H}_{37}\text{O})_3\text{P}$. White waxy solid; m.p. $45\text{--}47^\circ\text{C}$; sp. gr. 0.940 ($25/15^\circ\text{C}$). Used as a stabilizer in polymers and an intermediate.

tri-n-octylaluminum $(\text{C}_8\text{H}_{17})_3\text{Al}$.

Properties: Colorless pyrophoric liquid.

Derivation: Reaction between octene and isobutyl-aluminum.

Hazard: Toxic and flammable. Ignites in air.

Use: Polyolefin catalyst.

Shipping regulations: (Rail) Pyrophoric liquid, n.o.s., Red label. (Air) Not acceptable.

trioctyl phosphate (octyl phosphate) $(\text{C}_8\text{H}_{17})_3\text{PO}_4$.

Properties: Liquid. Sp. gr. 0.924 (26°C); b.p. $220\text{--}30$ (8 mm); soluble in alcohol, acetone, and ether. Combustible; low toxicity.

Uses: Solvent, antifoaming agent; plasticizer.

trioctylphosphinic oxide (TOPO). $(\text{C}_8\text{H}_{17})_3\text{PO}$

Properties: Solid; m.p. 55°C ; min. purity 95%.

Containers: 25 and 100-lb. fiber drums.

Uses: Reagent for extraction of metals from aqueous and nonaqueous solutions, including fissionable actinide elements.

trioctyl phosphite. See tris-2-ethyl-hexyl phosphite.

"**Triodine.**"²⁸⁴ Trademark for a cleaner-sanitizer-disinfectant particularly formulated for use in the bottling industry. Contains nonionic-iodine complexes.

triolein. See olein.

triorthocresylphosphate. See tricresyl phosphate (hazard).

"**Triox.**"²⁵³ Trademark for a weed killer containing sodium arsenite.

Hazard: Highly toxic by ingestion.

sym-trioxane (triformol; trioxin; metaformaldehyde) $(\text{CH}_2\text{O})_3$ or $\text{CH}_2\text{OCH}_2\text{OCH}_2\text{O}$. A trimer of formaldehyde; not to be confused with paraformaldehyde (q.v.) which consists of 8 or more formaldehyde units.

Properties: White crystals, formaldehyde odor; m.p. 62°C ; sublimes at 115°C ; flash point (open cup) 113°F . Soluble in water; soluble in alcohol and ether. Auto-ignition temp. 777°F .

Derivation: By distillation of formaldehyde with an acid catalyst, and extraction with solvent.

Containers: Drums; solid blocks in polyethylene containers.

Hazard: Moderate fire risk; explosive limits in air 3.6 to 29%.

Uses: Organic synthesis; disinfectant; nonluminous, odorless fuel.

See also formaldehyde.

2,6,8-trioxypurine. See uric acid.

tripalmitin (palmitin; glyceryl tripalmitate)

Properties: White, crystalline powder. Soluble in ether and chloroform. Insoluble in water. M.p. 65.5°C; sp. gr. 0.866 (80/4°C). Combustible. Low toxicity.

Derivation: From glycerol and palmitic acid.

Grade: Technical.

Containers: Tins; fiber drums.

Uses: Medicine; soap; leather dressing.

tripelennamine citrate $\text{C}_{16}\text{H}_{21}\text{N}_3 \cdot \text{C}_6\text{H}_8\text{O}_7$. 2-[Benzyl(2-dimethylaminoethyl)amino]pyridine dihydrogen citrate.

Properties: White, bitter crystalline powder. Solutions are acid to litmus. M.p. 107°C. Soluble in water and alcohol; very slightly soluble in ether; practically insoluble in chloroform and benzene. 1% solution in water has a pH of about 4.3.

Grade: U.S.P.

Hazard: Moderately toxic by ingestion.

Use: Medicine (antihistamine; sunburn treatment).

tripentaerythritol $(\text{CH}_2\text{OH})_3\text{CCH}_2\text{OCH}_2\text{C}(\text{CH}_2\text{OH})_2 \cdot \text{CH}_2\text{OCH}_2\text{C}(\text{CH}_2\text{OH})_3$.

Properties: White to ivory powder; has eight primary hydroxyl groups, all esterifiable. Melting range 225–240°C. Combustible. Low toxicity.

Uses: Hard resins, varnishes, and fast-drying tall oil vehicles.

"Triptek."¹³⁸ Trademark for tripentaerythritol, technical.

triphenol P. See 1,1,3-tris(hydroxyphenyl)-propane.

triphenylantimony (triphenylstibine) $\text{Sb}(\text{C}_6\text{H}_5)_3$.

Properties: White crystalline solid; sp. gr. 1.434 (25°C); m.p. 46–53°C; b.p. less than 360°C. Insoluble in water; slightly soluble in alcohol; soluble in most organic solvents. Combustible. Low toxicity.

Derivation: Reaction of antimony trichloride with phenyl magnesium bromide or phenyl sodium.

Containers: 10-, 50-, 200-lb drums.

Uses: Stibonium salts; co-catalyst in converting trienes to aromatics and hydroaromatics; reacts with nitric-sulfuric acid to give trinitro derivatives; polymerization inhibitor; lubricating oil additive.

triphenylcarbinol, bis(4-dimethylamino)-

Properties: Solid; m.p. 121–123°C; very soluble in ether and hot benzene; soluble in acids.

Use: Dyestuffs (see malachite green).

triphenyl formazan $\text{CN}_4\text{H}(\text{C}_6\text{H}_5)_3$. Red insoluble derivative of tetrazolium chloride; formed when the latter comes into contact with viable portions of a seed. Used in germination and viability tests.

triphenylguanidine (TPG) $\text{C}_6\text{H}_5\text{NC}(\text{C}_6\text{H}_5\text{NH})_2$.

Properties: White crystalline powder; soluble in alcohol. Sp. gr. 1.10; m.p. 144°C. Combustible; low toxicity.

Derivation: Desulfurization of thiocarbanilide in presence of aniline.

Use: Accelerator for vulcanization of rubber.

triphenylmethane dye. Any of a group of dyes whose molecular structure is basically derived from $(\text{C}_6\text{H}_5)_3\text{CH}$, usually by substitution of NH_2 , OH , HSO_3 , or other groups or atoms for some of the hydrogen of the C_6H_5 groups. Many coal tar and synthetic dyes are of this class, including rosaniline, fuchsin, malachite green, and crystal violet. See also triarylmethane dye.

triphenylmethane triisocyanate. Available as a brown 20% solution in methylene chloride. Used for bonding uncured rubber to metal or other surfaces.

triphenylmethylhexafluorophosphate.

Properties: Orange-colored, free-flowing crystalline powder.

Hazard: May be toxic.

Uses: Catalyst in manufacture of polyoxymethylenes (polymers of formaldehyde and trioxane).

See also acetal resin.

triphenyl phosphate (TPP) $\text{PO}(\text{OC}_6\text{H}_5)_3$.

Properties: Colorless, odorless, crystalline powder.

Soluble in most lacquers, solvents, thinners, oils. Insoluble in water. M.p. 50°C; b.p. 245°C (11 mm Hg); sp. gr. 1.268 (60°C); wt/gal 10.5 lbs; refractive index 1.550 (60°C). Combustible. Flash point 428°F. (C.C.).

Derivation: Interaction of phenol and phosphorus oxychloride.

Grade: Technical.

Containers: 200-lb fiber drums; barrels; multiwall paper sacks.

Hazard: Toxic by inhalation. Tolerance, 3 mg per cubic meter in air.

Uses: Fire-retarding agent; plasticizer for cellulose acetate and nitrocellulose.

triphenylphosphine. See triphenylphosphorus.

triphenyl phosphite $(\text{C}_6\text{H}_5\text{O})_3\text{P}$.

Properties: Water-white to pale yellow solid or oily liquid; pleasant odor; sp. gr. 1.184 (25/25°C); m.p. 22–25°C; b.p. 155–160°C (0.1 mm); refractive index 1.589 (25°C); flash point 425°F (COC). Combustible.

Containers: 55-gal drums.

Uses: Chemical intermediate; stabilizer systems for resins; metal scavenger; diluent for epoxy resins.

triphenylphosphorus (triphenylphosphine) $(\text{C}_6\text{H}_5)_3\text{P}$.

Properties: White, crystalline solid; m.p. 79–82°C; b.p. above 360°C; sp. gr. 1.132 (25°C). Insoluble in water; slightly soluble in alcohol; soluble in benzene, acetone, carbon tetrachloride. Flash point 356°F. (O.C.). Combustible.

Derivation: By a modified Grignard synthesis.

Containers: 10-, 50-, 150-lb drums.

Uses: Synthesis of organic compounds, phosphonium salts, other phosphorus compounds.

triphenylstibine. See triphenylantimony.

triphenyltetrazolium chloride. See tetrazolium chloride.

triphenyltin acetate $(\text{C}_6\text{H}_5)_3\text{SnOOCCH}_3$. An agricultural biocide. White crystalline solid, made by reaction of sodium acetate with triphenyltin chloride.

Hazard: Toxic and irritant to skin. Tolerance (as Sn), 0.1 mg per cubic meter in air.

triphenyltin chloride (C_6H_5)₃SnCl.

Properties: White crystalline solid; m.p. 106°C; b.p. 240°C (13.5 mm). Insoluble in water; soluble in organic solvents.

Derivation: Reaction of tin tetrachloride with phenylmagnesium bromide.

Hazard: Toxic and irritant to skin. Tolerance (as Sn), 0.1 mg per cubic meter in air.

Use: Biocidal intermediate.

triphenyltin hydroxide (C_6H_5)₃SnOH.

Properties: White solid; m.p. 118–120°C. Insoluble in water; soluble in ether, benzene, and alcohol.

Hazard: Toxic and irritant to skin. Tolerance (as Sn), 0.1 mg per cubic meter in air.

Uses: Insect chemisterilant; fungicide.

"Triphosaden."⁹¹ Trademark for adenosine triphosphate used for biochemical and clinical research, and medicine.

triphosgene. See hexachloromethylcarbonate.

triphosphoric acid. See polyphosphoric acid.

triple bond. A highly unsaturated linkage between the two carbon atoms of acetylenic compounds (alkynes), typified by acetylene ($HC\equiv CH$). It is somewhat less reactive than a double bond in a comparable structure toward electrophilic reagents, but far more reactive than the single bonds in paraffinic compounds. See also double bond; chemical bonding.

triple point. The temperature and pressure at which the solid, liquid, and vapor of a substance can exist simultaneously. Also applied to similar equilibrium between any three phases, i.e., two solids and a liquid, etc. The triple point of water is of special importance because it is the fixed point (273.16°K) for the absolute scale of temperature; it is 0.00°C at 4.6 mm Hg.

triple superphosphate. A dry, granular, free-flowing product, gray in color; produced by addition of phosphoric acid to phosphate rock, thus avoiding formation of insoluble gypsum, as in superphosphate, and achieving about three times the amount of available phosphate (as P_2O_5).

Typical analysis: Moisture 2%; available P_2O_5 50%; water soluble P_2O_5 45%; free phosphoric acid 1%; also minor ingredients.

Containers: Bags; bulk; carloads.

Use: Fertilizer.

See also superphosphate and nitrophosphate.

tripoli (rottenstone).

Derivation: A porous, siliceous rock resulting from the natural decomposition of siliceous sandstone.

Grades: Various grades according to fineness for polishing; rose; cream; white.

Uses: Abrasive; polishing powder; filtering material; absorbent for insecticidal chemicals; paints (inert filler, wood filler); rubber filler; base for scouring soaps and powders.

tripolyphosphate. See sodium tripolyphosphate.

tripotassium orthophosphate. See potassium phosphate, tribasic.

tripotassium phosphate. See potassium phosphate, tribasic.

tripropionin. See glyceryl tripropionate.

tri-n-propylaluminum (C_3H_7)₃Al.

Properties: Colorless pyrophoric liquid; density 0.820 g/ml; f.p. -84°C.

Derivation: Reaction of propylene and isobutylaluminum.

Hazard: Toxic and flammable; dangerous fire risk; ignites spontaneously in air.

Use: Polyolefin catalyst.

Shipping regulations: Pyrophoric liquids, n.o.s., (Air) Not acceptable. (Rail) Red label.

tripropylamine ($CH_3CH_2CH_2$)₃N.

Properties: Water white liquid; amine odor; f.p. -94°C; boiling range 150–156°C; sp. gr. (20/20°C) 0.754; refractive index 1.417 (20°C); flash point 105°F (O.C.). Probably low toxicity. Combustible.

Containers: 5-gal cans; 55-gal drums; tank cars.

Hazard: Moderate fire risk.

tripropylene (propylene trimer) (C_3H_6)₃.

Properties: Colorless liquid; sp. gr. (20/20°C) 0.738; boiling range 133.3°–141.7°C. Weight 6.17 lb/gal (60°F); flash point 75°F (TOC). Probably low toxicity.

Derivation: Catalytic polymerization of propylene.

Containers: Drums; barges; tank cars.

Hazard: Flammable, dangerous fire risk.

Uses: Oxo feed stock; lubricant additive; plasticizers; nonyl phenol.

Shipping regulations: Flammable liquids, n.o.s. (Rail, Air) Flammable Liquid label.

tripropylene glycol $HO(C_3H_6O)_2C_3H_6OH$.

Properties: Colorless liquid; supercools instead of freezing; b.p. 268°C; sp. gr. 1.019 (25/25°C); lb/gal 8.51; refractive index 1.442 (n 25/D); flash point 285°F. Soluble in water, methanol, ether. Combustible. Low toxicity.

Containers: Drums; tank cars; tank trucks.

Uses: Intermediate in resins, plasticizers, pharmaceuticals; insecticides; dyestuffs; mold lubricants.

tripropylene glycol monomethyl ether

$HO(C_3H_6O)_2C_3H_6OCH_3$.

Properties: Colorless liquid. Sp. gr. 0.961 (25°C); b.p. 242°C; 116°C (10 mm); viscosity 5.5 cp (25°C); refractive index 1.427 (25°C); flash point 250°F. Completely miscible with water, VMP naphtha, acetone, ethanol, benzene, carbon tetrachloride, ether, methanol, monochlorobenzene, and petroleum ether. Combustible. Low toxicity.

Use: Ingredient in hydraulic fluids.

triptane. See 2,2,3-trimethylbutane.

"Triptide."⁹¹ Trademark for lyophilized monosodium glutathione used for biochemical and clinical research, and medicine.

tris- A prefix indicating that a certain chemical grouping occurs three times in a molecule, e.g., tris(hydroxymethyl)aminomethane (CH_2OH)₃CNH₂. See also bis-.

tris amine buffer. See tris(hydroxymethyl)aminomethane.

"Tris Amino."³¹⁹ Trademark for pharmaceutical grade of tris(hydroxymethyl)aminomethane.

tris(1-aziridinyl)phosphine oxide. See triethylenephosphoramide.

2,4,6-tris(1-aziridinyl)-s-triazine. See triethylenemelamine.

trisazo dye. One of the four kinds of azo dyes, characterized by the presence of three azo couplings ($-N\equiv N-$) in each molecule. (CI 30000 to 34999).

tris(2-chloroethyl) phosphate (ClC_2H_4O)₃PO.

Properties: Clear, transparent liquid; sp. gr. 1.425

(20/20°C); b.p. 214°C (25 mm); refractive index 1.4721 (n_D 20/D). Flash point 421°F (COC); combustible.

Use: Flame-retardant plasticizer.

tris(2-chloroethyl) phosphite (ClC₂H₄O)₃P.

Properties: Colorless liquid with characteristic odor. Sp. gr. 1.353 (20/4°C); b.p. 119°C (0.15 mm); flash point 280°F (O.C.). Miscible with most common organic solvents. Undergoes intramolecular isomerization at higher temperatures. Exposure to air should be minimum. Insoluble in water, and hydrolyzes in water. Combustible.

Containers: 5-gal, 55-gal steel drums.

Uses: Intermediate; component of vinyl stabilizers; grease additives; flameproofing compositions.

tris(2-chloroisopropyl) thionophosphate

[CH₃(CH₂Cl)CHO]₃PS.

Properties: Liquid. Phosphorus content 9.0%; density 1.282 g/ml at 68°F; open cup flash point above 347°F; pour point less than -50°C. Readily soluble in gasoline; insoluble in water. Combustible.

Uses: To extend spark plug life, to control deposit-induced knocking in gasoline engines.

tris(2,3-dibromopropyl) phosphate

(CH₂BrCHBrCH₂O)₃PO.

Properties: Viscous, pale yellow liquid; density 18.5 lb/gal; refractive index 1.5772 (20°C). Combustible.

Containers: Steel drums.

Use: Flame retardant for plastics.

tris(2,4-dichlorophenoxyethyl) phosphite. See "Falone."

tris(2,3-dichloropropyl) phosphate

(CH₂ClCHClCH₂O)₃PO. Used as a flame retardant in plastics, and as a secondary plasticizer. Combustible.

tris(diethylene glycol monoethyl ether) citrate

HO[C(CH₂COO(CH₂CH₂O)₂C₂H₅)₂COO-(CH₂CH₂O)₂C₂H₅].

Properties: Solid. Sp. gr. (25°C) 1.28; m.p. 16-19°C; soluble in water. Used as a plasticizer. Combustible.

2,4,6-tris-(ethylenimine)-s-triazine. See triethylene-melamine.

tris(2-ethylhexyl) phosphate

[C₄H₉CH(CH₂H₅)CH₂O]₃PO.

Properties: Colorless liquid; sp. gr. 0.9260 (20/20°C); f.p. below -90°C (sets to glass); pour point -74°C; mid-boiling point 216°C (4 mm); refractive index 1.441 (25°C). Insoluble in water; soluble in mineral oil and gasoline. Flash point 420°F. Combustible.

Use: Low-temperature plasticizer for PVC resins; imparting flame and fungus resistance.

tris-2-ethylhexyl phosphite (triocetyl phosphite)

[C₄H₉CH(CH₂H₅)CH₂O]₃P.

Properties: Colorless liquid; sp. gr. 0.902; b.p. (0.3 mm) 163-164°C; insoluble in water; soluble in alcohol and ether. Flash point 340°F. Combustible. Low toxicity.

Containers: Glass bottles; 5-, 55-gal drums.

Uses: Synthesis; plasticizers; stabilizers; lube and grease additives; flameproofing compositions.

tris(2-hydroxyethyl) isocyanurate (THEIC; tris(2-hydroxyethyl)-s-triazine-2,4,6-trione)

C₃N₃O₃(CH₂CH₂OH)₃.

Properties: White solid; m.p. 135°C; b.p., dissociates at 180°C (3 mm). Very soluble in water; somewhat

soluble in alcohol and acetone; insoluble in chloroform and benzene. Combustible.

Use: Additive to plastics, especially to impart thermal stability.

tris(hydroxymethyl)acetic acid

HOCH₂C(CH₂OH)₂COOH. A photographic chemical made by bacterial oxidation of pentaerythritol.

tris(hydroxymethyl)aminomethane

[Tri(hydroxymethyl)-aminomethane; THAM; 2-amino-2-hydroxymethyl-1,3-propanediol; tris amine buffer] (CH₂OH)₃CNH₂.

Properties: White crystalline solid. Solubility in water, 80 g/100 cc at 20°C. M.p. 171-172°C; b.p. (10 mm) 219-220°C; pH 0.1M aqueous solution 10.36. Corrosive to copper, brass, aluminum. Combustible.

Containers: Fiberpak boxes; drums.

Hazard: Irritant to skin and eyes.

Uses: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; chemical synthesis; buffer; medicine.

tris(hydroxymethyl)nitromethane (2-hydroxymethyl-2-nitro-1,3-propanediol) (CH₂OH)₂CNO₂.

Properties: White crystals or amorphous solid; m.p. 175°C; decomposes. Soluble in water and alcohol.

Hazard: Moderate fire risk; probably irritant to skin and eyes.

Uses: Bactericide and slimicide for aqueous systems; cutting oil emulsions; pulp and paper; industrial water systems; drilling muds.

1,1,3-tris(hydroxyphenyl)propane (triphenol P)

(C₆H₄OH)₃CHCH₂CH₂C₆H₄OH.

Properties: White solid; m.p. 84°C; sp. gr. 1.226 (20/20°C); f.p. 90-110°C; sets to glass below this temperature. Combustible.

Uses: Antioxidant; intermediate for polyester and alkyd resins.

"Tri-Sil."⁵³⁴ Trademark for a ready mixed, single solution of solvent, reagent, and catalyst used for rapidly converting samples of polar materials (e.g., carbohydrates, phenols, steroids, etc.) into volatile trimethylsilyl ethers for gas chromatographic analyses.

trisiloxane. See siloxane.

tris[1-(2-methyl)aziridinyl]phosphine oxide

(C₂H₅N)₃PO. See metepa.

"Tris Nitro."³¹⁹ Trademark for tris(hydroxymethyl)-nitromethane (q.v.).

trisodium citrate. See sodium citrate.

trisodium dipotassium triphosphosphate Na₃K₂P₃O₁₀.

Properties: White crystalline solid; m.p. 620-640°C; density 2.48; solubility in water (26°C) 80 g/100 ml.

Use: Sequestrant.

trisodium EDTA (ethylenediaminetetraacetic acid trisodium salt) C₁₀H₁₃N₂Na₃O₈ · H₂O. White powder; freely soluble in water. Used as an alkaline chelating agent.

trisodium hydroxyethylethylenediaminetriacetate

(NaOOCCH₂)₂NC₂H₄N(CH₂COONa)₂C₂H₄OH.

Properties: Liquid; sp. gr. 1.285; f.p. below -5°C.

Use: Chelating agent.

trisodium nitrilotriacetate N(CH₂COONa)₃. A sodium salt of nitrilotriacetic acid.

Use: Sequestrant.

trisodium orthophosphate. See sodium phosphate, tribasic.

trisodium phosphate. See sodium phosphate, tribasic.

trisodium phosphate, chlorinated

$4(\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}) \cdot \text{NaOCl}$. Active ingredients 3.25% min sodium hypochlorite and 91.75% min trisodium phosphate dodecahydrate. Inert ingredient, less than 5% NaCl.

Properties: White crystalline water-soluble solid; stable under normal storage conditions. In solution has the properties of both trisodium phosphate and sodium hypochlorite.

Derivation: By reacting sodium phosphate, caustic soda and sodium hypochlorite.

Containers: Bags; drums; and bulk.

Hazard: Moderately toxic; irritant to skin and eyes.

Uses: Cleaner and bactericide in dairies, food plants; dish washing compounds and scouring powders.

trisodium phosphate monohydrate. See sodium phosphate, tribasic, monohydrate.

tristearin. See stearin.

tris(tetrahydrofurfuryl) phosphate $(\text{C}_4\text{H}_7\text{OCH}_2\text{O})_3\text{PO}$.

Properties: Yellow liquid; f.p. -75°C ; refractive index 1.4759 (n_{D}^{20}); soluble in water and aromatic solvents.

Hazard: May be toxic.

Uses: Plasticizer; solvent.

"Tritac."⁶² Trademark for a group of herbicides whose active ingredient is 2,3,6-trichlorobenzyloxypropanol.

"Trithion."¹ Trademark for an organic phosphate insecticide-acaricide available as aqueous emulsion, dust, and wettable powder containing various percentages of carbophenothion.

Hazard: See carbophenothion.

"Tritiac."⁵²⁹ Trademark for tritium-activated self-luminous compounds and paints. Available in varying grades of luminosity up to 100 micro-lamberts.

tritium T Radioactive isotope of hydrogen; mass number 3; isotopic weight 3.017 (two neutrons and one proton in the nucleus).

Properties: Half-life 12.5 years; radiation, beta; radiotoxicity, very low.

Derivation: Bombardment of lithium with low-energy neutrons.

Forms available: Gas packaged in ampules and in tagged compounds such as water, streptomycin, cortisone, epinephrine, octadecane, stearic acid, etc.

Uses: Bombarding particle in cyclotrons; activator in self-luminous phosphors; in cold cathode tubes; tracer in biochemical research and various special problems in chemical analysis; luminous instrument dials.

tritoly phosphate. See tricresyl phosphate (ortho isomer).

triton. The nucleus of the tritium atom (one proton, two neutrons).

"Triton."²³ Trademark for surfactants based on alkylaryl polyether alcohols, sulfonates and sulfates; nonionic, cationic and anionic types; oil-soluble and water-soluble types. Supplied as viscous liquids, pastes, or aqueous solutions. Surface activity includes detergency, emulsification, wetting, spreading, dispersing action.

Uses: Processing of textile fabrics and yarns; leather tannery operations; emulsification of pesticides; sanitizing and cleansing formulations; cosmetic prepara-

tions; medicinal soaps; paper manufacture; oil-well flooding; polymer manufacture; petroleum additives.

tritopine. See laudanidine.

"Tri-Una-Sol."⁵⁸ Trademark for nitrogen fertilizer solutions; varying analysis of 28, 30 and 32% nitrogen; containing urea, ammonium nitrate and water.

triuranium octoxide (uranous-uranyl oxide; uranyl uranate) U_3O_8 .

Properties: Olive-green to black solid; crystals or granules; insoluble in water; soluble in nitric acid and sulfuric acid. Sp. gr. 8.39; decomposes when heated to 1300°C to uranium dioxide.

Source: The naturally occurring uranium oxide found in pitchblende.

Derivation: (a) As one of the forms of uranium produced from the ores, often by a solvent extraction process. The solvent used is dodecylphosphoric acid. (b) A common form of triuranium octoxide is yellow cake, the powder obtained by evaporating an ammonia solution of the oxide.

Hazard: Radioactive poison. Use appropriate protection in handling.

Uses: Nuclear technology; preparation of other uranium compounds.

Shipping regulations: (Rail, Air) Consult regulations.

trixylenyl phosphate. See tri(dimethylphenyl)phosphate.

"Trizone."²³³ Trademark for fumigants containing methyl bromide, chloropicrin, and 3-bromo-1-propyne.

"Trolene."²⁵³ Trademark for insecticides containing O,O-dimethyl-O-(2,4,5-trichlorophenyl)phosphorothioate.

Hazard: Toxic; cholinesterase inhibitor.

"Troluolil."²⁰⁰ Trademark for a petroleum solvent prepared by straight-run distillation.

Properties: Water-white, initial boiling point $194-205^\circ\text{F}$, 95% distills between 235 and 247°F ; sp. gr. 0.741 (60°F); flash point (TCC) 25°F ; mild, nonresidual odor.

Hazard: Flammable, dangerous fire risk.

Uses: Lacquers, rubber cements, and gravure inks.

"Tromexan."²¹⁹ Trademark for ethyl biscoumacetate.

trona (urao) $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$. A natural sodium sesquicarbonate and the most important of the natural sodas.

Properties: White, gray or yellow with vitreous, glistening luster. Noncombustible. Low toxicity. See Trona process.

Occurrence: Hungary, Egypt, Africa, Venezuela, and United States (Wyoming; California, especially Searles Lake, Owens Lake).

Use: Source of sodium compounds, especially the sodium carbonates.

"Tronabor."⁸⁸ Trademark for crude borax pentahydrate, from Searles Lake brines.

Trona process. The method used for separation and purification of soda ash, anhydrous sodium sulfate, boric acid, borax, potassium sulfate, bromine and potassium chloride from Searles Lake (California) brine.

"Tronox."⁸⁴ Trademark for chloride process titanium dioxide; used as a white pigment.

tropacocaine hydrochloride $\text{C}_{15}\text{H}_{19}\text{NO}_2 \cdot \text{HCl}$. An alkaloidal salt.

Properties: White crystals. Soluble in water, alcohol, and ether. M.p. 271°C.

Derivation: From a variety of Erythroxylon coca.

Hazard: Toxic by ingestion and inhalation.

Use: Medicine.

3-tropanol. See torpine.

tropeolin D. See methyl orange.

tropeolin OO (Orange IV)

$\text{NaSO}_3\text{C}_6\text{H}_4\text{NNC}_6\text{H}_4\text{NHC}_6\text{H}_5$. para-Diphenylamino-azobenzene-sodium sulfonate. A biological stain and acid-base indicator, red at pH 1.4, yellow at pH 2.6. CI No. 13080.

tropine (3-tropanol) $\text{C}_8\text{H}_{15}\text{NO}$.

Properties: White, crystalline alkaloid; very hygroscopic. Soluble in water; alcohol, ether, and chloroform. M.p. 61.2–63°C; b.p. 233°C.

Derivation: By heating atropine or hyoscyamine with barium hydroxide.

Hazard: Toxic by ingestion and inhalation.

Use: Medicine.

Trouton's rule. The molar heat of vaporization of normal liquids, at the boiling point and under atmospheric pressure, divided by the absolute boiling temperature is a constant, approximately 22.

Trp. Abbreviation for tryptophan.

true solution. See solution (true).

truttine. A protein obtained from fish of the trout family.

"Trycite."²³³ Trademark for an oriented polystyrene film. Used for packaging and in envelope windows.

tryparsamide (sodium N-phenylglycineamide-para-arsenate) $\text{NaOAs}(\text{OOH})\text{C}_6\text{H}_4\text{NHCH}_2\text{CONH}_2 \cdot \frac{1}{2}\text{H}_2\text{O}$. Properties: White crystalline powder, odorless. Contains 24.6% arsenic. May affect eyes. Soluble in water; almost insoluble in alcohol; insoluble in ether, chloroform, benzene.

Grades: Medicinal; U.S.P.

Hazard: Highly toxic by ingestion and inhalation.

Use: Medicine (treatment of syphilis).

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

trypsin. The proteolytic enzyme of pancreatic juice. Yellow to grayish-powder; soluble in water; insoluble in alcohol or glycerin. It acts on albuminoid material producing amino acids. The maximum result is obtained in a neutral or slightly alkaline medium. Trypsins or similar materials are found not only in the pancreas but also in the spleen, leucocytes and urine, as well as in beer yeast, molds and bacteria.

Grade: N.F. (crystallized).

Hazard: Irritant to skin.

Uses: Medicine; dehairing of hides.

trypsinogen. An inactive precursor of trypsin (q.v.).

tryptophan (indole-alpha-aminopropionic acid; 1-alpha-amino-3-indolepropionic acid)

$\text{C}_6\text{H}_4\text{NHCHCCH}_2\text{CHNH}_2\text{COOH}$. One of the essential amino acids occurring naturally in the L(-)-form.

Properties:

DL-: White crystals; slightly soluble in water; stable in alkaline solution; decomposed by strong acids.

D(+)-: Characteristic sweet taste; m.p. 275–290°C

(dec); soluble in water, hot alcohol, alkali hydroxides; insoluble in chloroform.

L(-)-: Flat taste (other properties identical with D(+)-tryptophan).

Derivation: (a) Synthetic tryptophan can be made by the conversion of indole to gramine, followed by methylation, interaction with acetylaminomalonic ester and hydrolysis; (b) hydrolysis of proteins.

Grades: Reagent; technical; F.C.C.

Containers: 1-, 5-lb bottles; drums.

Uses: Nutrition and research; medicine; dietary supplement; cereal enrichment.

Available commercially in all three forms, as well as acetyl-DL-tryptophan.

"Trysben" 200.²⁸ Trademark for a weed killer based on aqueous solution of the dimethylamine salt of trichlorobenzoic acid, containing 2 lb of acid equivalent per gallon.

Use: Control of broadleaf weeds.

Ts. Abbreviation for tosyl.

TSA. Abbreviation for toluenesulfonic acid (q.v.).

TSH. See thyrotropic hormone.

TSP. Abbreviation for trisodium phosphate. See sodium phosphate, tribasic.

TSPA. Abbreviation for triethylenethiophosphoramide.

TSPP. Abbreviation for tetrasodium pyrophosphate. See sodium pyrophosphate.

TTC. Abbreviation for tetrazolium chloride (q.v.).

TTD. Abbreviation for tetraethylthiuram disulfide.

"Tuads." See "Ethyl Tuads"; "Methyl Tuads."

"Tuamine."¹⁰⁰ Trademark for tuaminoheptane sulfate. **tuaminoheptane.** See 2-aminoheptane.

tuaminoheptane sulfate

$[\text{CH}_3(\text{CH}_2)_4\text{CHNH}_2\text{CH}_3]_2 \cdot \text{H}_2\text{SO}_4$.

Properties: White odorless powder; readily soluble in water and alcohol.

Grade: N.F.

Use: Medicine.

"Tuasal."²³³ Trademark for a brominated salicylanilide mixture; used as a bacteriostat.

"Tubarine."³⁰¹ Trademark for d-tubocurarine chloride (q.v.).

tubatoxin. See rotenone.

tuberosc oil.

Properties: Colorless to very light-colored oil; sp. gr. 1.007–1.035 at 15°C; taken from Polianthes tuberosa, by enfleurage. Nontoxic.

Uses: Perfume; flavoring.

4-tubocurarine chloride $\text{C}_{18}\text{H}_{14}\text{Cl}_2\text{N}_2\text{O}_6 \cdot 5\text{H}_2\text{O}$.

Properties: White to light tan, odorless, crystalline alkaloid. M.p. about 270°C with decomposition; soluble in water and alcohol; insoluble in acetone, chloroform, and ether. Aqueous solution is strongly dextrorotatory. (Specific rotation for 1% solution of anhydrous –208° to +218°.)

Grade: U.S.P.

Hazard: Toxic in high concentrations.

Use: Medicine (muscle relaxant).

"Tuex."²⁴⁸ Trademark for tetramethylthiuram disulfide. Available in pellets as "Tuex Naugets." See thiram.

"Tuf-Foil."⁵²⁴ Trademark for aluminum and aluminum alloys in foil form.

"Tumerol."³⁴² Trademark for oleoresin of tumeric for food coloring and flavoring.

tung oil (China-wood oil).

Properties: Yellow drying oil. Soluble in chloroform, ether, carbon disulfide, and oils. Sp. gr. 0.9360-0.9432; saponification value 193; iodine value 150-165; refractive index 1.5030. Flash point 552°F. Autoignition temp. 855°F. Low toxicity. Combustible.

Derivation: From the seeds of *Aleurites cordata*, a tree indigenous to China. It is now produced in China, Argentina and Paraguay; U.S. production has been virtually discontinued.

Chief constituent: Eleostearic acid (80%).

Uses: Exterior paint; varnishes.

"Tung-Spray."⁴⁵⁶ Trademark for a suspension of pure, submicron tungsten disulfide in a fast-drying isopropanol carrier. Stable in air to 950°F.

Containers: 16-oz. aerosol cans.

Hazard: Flammable, dangerous fire risk.

tungstated pigment. See phosphotungstic pigment.

tungstate white. See barium tungstate.

tungsten (wolfram) W Metallic element; atomic number 74; group VIB of periodic system. Atomic weight 183.85. Valences 2, 4, 5, 6. Five isotopes.

Properties: Hard, brittle, gray solid. Not found native. The ores are scheelite and wolframite. Sp. gr. 19.3 (20°C); m.p. 3410°C (highest of all the metals); b.p. 5927°C. High electrical conductivity. Soluble in a mixture of nitric acid and hydrofluoric acid. Low toxicity. Corroded by seawater. Oxidizes in air at 400°C, the rate increasing rapidly with temperature.

Derivation: (a) Aluminothermic reduction of tungstic oxide; (b) hydrogen reduction of tungstic acid or its anhydride.

Fabrication: The metal can be plated onto objects by vapor deposition from tungsten hexafluoride or hexacarbonyl and can bond metal parts together. Tungsten powder (produced by carbon reduction) is converted into solid metal by powder metallurgical techniques. Large single crystals are grown by an arc-fusion process. Granules obtained by reduction of the hexafluoride.

Occurrence: Korea, Mexico, U.S.S.R., China, Spain and United States (Arizona, California, Colorado, Nebraska, Nevada, New Mexico, and Texas).

Grades: Technical; powder; single crystals; granules, ultrapure of 50-600 microns.

Containers: Cans, barrels, drums (powder).

Hazard: Finely divided form is highly flammable and may ignite spontaneously. Tolerance (as W) (insoluble compounds): 5 mg per cubic meter of air; soluble compounds, 1 mg per cubic meter of air.

Uses: High-speed tool steel; ferrous and nonferrous alloys; ferrotungsten; filaments for electric light bulbs; contact points; dentistry; x-ray and electron tubes; welding electrodes; heating elements in furnaces and vacuum-metallizing equipment; rocket nozzles and other aerospace applications; shell steel; chemical apparatus; high speed rotors as in gyroscopes; solar energy devices (as vapor-deposited film, which retains heat at about 500°C).

tungsten boride WB₂.

Properties: Silvery solid; sp. gr. 10.77; m.p. ca 2900°C; insoluble in water; soluble in aqua regia and concentrated acids; decomposed by chlorine at 212°F.

Derivation: Heating tungsten and boron in electric furnace.

Use: Refractory.

tungsten carbide WC. A ditungsten carbide, W₂C, with similar physical properties, is also known. WC is said to be the strongest of all structural materials. Properties: Gray powder; sp. gr. 15.6; m.p. 2780°C; b.p. 6000°C; hardness of 9+ (Mohs) in solid form; insoluble in water but readily attacked by a nitric acid-hydrofluoric acid mixture. Stable to 400°C with chlorine; burns with fluorine at room temperature; oxidizes on heating with air.

Derivation: Heating tungsten and lamp black at 1500-1600°C.

Hazard: Toxic by inhalation. Tolerance (as W), 5 mg per cubic meter of air.

Uses: Cemented carbide tools; dies; wear-resistant parts; cermets; electrical resistors. An abrasive in liquids.

tungsten carbide, cemented. A mixture consisting of tungsten carbide 85-95% and cobalt 5-15%.

Properties: Sp. gr. 12-16; hardness about that of corundum; not affected by high temperatures.

Derivation: Ball milling of powdered tungsten carbide with metallic cobalt, followed by sintering.

Hazard: See tungsten carbide.

Uses: Machine tools and abrasives for machining and grinding metals, rocks, molded products, porcelain and glass; in gages, knife edges, blast nozzles.

tungsten carbonyl. See tungsten hexacarbonyl.

tungsten diselenide WSe₂. Lamellar-structured, dry solid lubricant with exceptional high temperature and high vacuum stability; retains its lubricity to temperatures as low as -423°F.

Grades: 1-2 micron and 40 micron.

Hazard: Toxic. Tolerance (as W), 5 mg per cubic meter of air.

tungsten disulfide WS₂.

Properties: Grayish black solid; m.p. above 1480°C; can lubricate at temperatures above 2400°F (1316°C). Attacked by fluorine and hot sulfuric and hydrofluoric acids.

Grades: 0.40, 0.70 and 1-2 micron grades.

Hazard: Toxic. Tolerance (as W), 5 mg per cubic meter of air.

Use: Solid lubricant for many applications, including use as an aerosol.

tungsten hexacarbonyl (tungsten carbonyl) W(CO)₆.

Properties: White, volatile, high refractive, crystalline solid; decomposes without melting at 150°C. One of the more stable carbonyls. Sp. gr. 2.65; vapor pressure 0.1 mm (20°C). Insoluble in water; soluble in organic solvents.

Derivation: Reaction of tungsten with carbon monoxide at high pressures; reduction of tungsten hexachloride with iron alloy powders in CO atmosphere.

Hazard: Toxic. Tolerance (as W), 5 mg per cubic meter of air.

Use: Tungsten coatings on base metals by deposition and decomposition of the carbonyl.

tungsten hexachloride WCl₆.

Properties: Dark blue or violet hexagonal crystals; volatile; m.p. 275°C; b.p. 347°C; sp. gr. 3.52; vapor pressure 43 mm (215°C); electrical conductivity (fused state) poor. Soluble in organic solvents including ligroin and ethanol. Decomposed by moist air and water; reduced by hydrogen to the metal.

Derivation: Heating tungsten with dry chlorine at red heat.

Hazard: Toxic. Tolerance (as W), 5 mg per cubic meter of air.

Uses: Tungsten coatings on base metals; vapor deposition for bonding metals; single crystal tungsten wire; additive to tin oxide to produce electrically conducting coating for glass; catalyst for olefin polymers.

tungsten hexafluoride WF_6 .

Properties: Colorless gas or light yellow liquid. Sp. gr. (liquid) 3.44; m.p. $2.5^\circ C$; b.p. $19.5^\circ C$. Decomposes in water.

Derivation: Direct fluorination of powdered tungsten. Purified by distillation under pressure.

Hazard: Toxic by ingestion and inhalation. Strong irritant to tissue. Tolerance (as W), 1 mg per cubic meter of air.

Uses: Vapor phase deposition of tungsten; fluorinating agent.

tungsten lake. See phosphotungstic pigment.

tungsten oxychloride $WOCl_4$.

Properties: Dark red, acicular crystals. Decomposed by water and moist air. Keep in sealed glass containers! B.p. (approx) $227.5^\circ C$; m.p. (approx) $211^\circ C$; sp. gr. 11.92; soluble in carbon disulfide.

Derivation: By the action of chlorine on tungsten or tungstic oxide at elevated temperatures.

Purification: Vacuum distillation.

Grade: Technical.

Hazard: Toxic and irritant. Tolerance, 1 mg per cubic meter of air (as W).

Use: Incandescent lamps.

tungsten silicide. A ceramic. Probably WSi_2 .

Properties: Blue-gray, very hard solid; sp. gr. 9.4; m.p. above $900^\circ C$. Insoluble in water; attacked by fused alkalis and mixtures of nitric and hydrofluoric acids.

Grades: Cylindrical shapes, lumps, standard sieve sizes.

Hazard: Dust flammable. Tolerance, 5 mg per cubic meter of air (as W).

Uses: Oxidation-resistant coatings; electrical resistance and refractory applications.

tungsten steel. In many of its alloying effects, tungsten is similar to molybdenum. Tungsten increases the density of alloys to which it is added. It is used to obtain steels with great wear resistance and special resistance to tempering, as in high-speed steels, hot-work steels, finishing steels that maintain keen cutting edge and great wear resistance, creep-resisting steels, and oxidation-resistant, high-temperature, high-strength alloys.

tungsten trioxide. See tungstic oxide.

tungstic acid (wolframic acid; orthotungstic acid) H_2WO_4 .

Properties: Yellow powder; sp. gr. 5.5. Insoluble in water; soluble in hydrofluoric acid and alkalis. A white form of tungstic acid exists, having the formula $H_2WO_4 \cdot H_2O$. This is formed by acidifying tungstate solutions in the cold.

Derivation: Decomposition of sodium tungstate with hot sulfuric acid.

Grades: Technical; C.P.; reagent.

Containers: Drums; polyethylene bags; tonnage lots.

Hazard: Toxic. Tolerance (as W), 5 mg per cubic meter of air.

Uses: Textiles (mordant, color resist); plastics; tungsten metal, wire, etc.

tungstic acid anhydride. See tungstic oxide.

tungstic anhydride. See tungstic oxide.

tungstic oxide (tungstic acid anhydride; tungstic anhydride; tungsten trioxide; wolframic acid, anhydrous) WO_3 .

Properties: Canary yellow, heavy powder; dark orange when heated and regains original color on cooling; m.p. $1473^\circ C$; sp. gr. 7.16. Insoluble in water; soluble in caustic alkalis; soluble with difficulty in acids. Noncombustible.

Derivation: Scheelite ore is treated with hydrochloric acid and the resulting product dissolved out with ammonia. The complex ammonium tungstate can then be ignited to tungstic oxide.

Hazard: Toxic. Tolerance (as W), 5 mg per cubic meter of air.

Uses: To form metal by reduction; alloys; preparation of tungstates for x-ray screens; fireproofing fabrics; *yellow pigment in ceramics.*

"Tungstide."²⁸⁹ Trademark for a series of coatings consisting of metallic tungsten of near-colloidal particle-size suspended in a liquid plastic and incorporated with a form of "Liqui-Moly," (a molybdenum disulfide product) to produce a hard, abrasion-resistant self-lubricating coating.

tungstophosphate. Structure and properties are similar to molybdophosphate (q.v.).

12-tungstophosphoric acid. See phosphotungstic acid.

tungstosilicate. One of a group of complex inorganic compounds of high molecular weight, containing a central silicon atom surrounded by tungsten oxide octahedra. They have high molecular weight, high degree of hydration, strong oxidizing action in aqueous solution; they decompose in strongly basic aqueous solutions to give simple tungstate solutions; they form highly colored anions or reaction products. See silicotungstic acid and sodium 12-tungstosilicate.

12-tungstosilicic acid. See silicotungstic acid.

"Turgum S."²⁸⁵ Trademark for a resin acid; sp. gr. 1.06-1.07; an odorless tackifier, retarder, and processing aid. Slightly retarding in cure.

turkey brown (turkey umber). Natural earth used as permanent pigment. Contains iron and manganese oxides with some clay.

Turkey red. See iron oxide red.

Turkey red oil (castor oil, sulfonated; castor oil, soluble). It is also known as alizarin assistant and alizarin oil because of its use in dyeing with alizarin.

Properties: Viscous liquid. Sp. gr. 0.95; iodine no. 82.1; acid no. 174.3; saponification no. 189.3. Soluble in water. Combustible; low toxicity. Autoignition temp. $833^\circ F$.

Derivation: By sulfonating castor oil with sulfuric acid and washing.

Grades: Sulfonated castor oil graded as to moisture and color.

Containers: 55-gal barrels and drums; 500-lb barrels. **Uses:** Textiles; leather; manufacture of soaps; alizarin dye assistant; paper coatings.

Turnbull's Blue. An inorganic blue pigment made by the reaction of a ferrous salt and potassium ferricyanide $[\text{Fe}_3\text{Fe}(\text{CN})_6]_2$. One of its important uses is in making blueprints, in which sensitized paper containing ferric ammonium citrate and potassium ferricyanide is exposed to light, the ferric ions being thus reduced to ferrous ions. See also Iron Blue.

turpentine (gum). The oleoresin or pitch obtained from living pine trees. Sticky, viscous balsamic liquid comprising a mixture of rosin and turpentine oil. Strong piny odor. Soluble in alcohol, ether, chloroform and glacial acetic acid. Combustible; low toxicity.

Uses: Source of turpentine oil and gum rosin. See also rosin.

turpentine (oil) $\text{C}_{10}\text{H}_{16}$. A volatile essential oil whose chief constituents are pinene and diterpene.

Derivation: Steam-distillation of the turpentine gum (q.v.) exuded from living pine trees (gum turpentine), or naphtha-extraction of pine stumps (wood turpentine); destructive distillation of pine wood. See also rosin; rosin oil.

Properties: Colorless liquid; penetrating odor. Immiscible with water; lighter than water. Considerable variation appears in constants reported. The following are based on tests made by the Forest Products Laboratory: Sp. gr. (15°C) 0.860–0.875; refractive index 1.463–1.483 (20°C); flash point (closed cup) 90 to 115°F ; acidity none; wt in lb/gal 7.18; auto-ignition temp. 488°F .

Containers: Bottles; cans; drums.

Hazard: Moderate fire risk. Toxic by ingestion. Tolerance, 100 ppm in air.

Uses: Solvent; thinner for paints, varnishes and lacquers; rubber solvent and reclaiming agent; insecticide; synthesis of camphor and menthol; wax-based polishes; medicine (liniments); perfumery.

"Tutane."⁵³⁰ Trademark for 2-aminobutane; used as a fungicide.

Tw. Abbreviation for Twaddell, used in reporting specific gravities for densities greater than water, as $^\circ\text{Tw}$. A Twaddell reading, multiplied by five and added to 1000, gives specific gravity with reference to water as 1000.

"Tween."⁸⁹ Trademark for a series of general-purpose emulsifiers and surface active agents. They are polyoxyethylene derivatives of fatty acid partial esters of sorbitol anhydrides. Generally soluble or dispersible in water, and differ widely in organic solubilities.

"Twitchell."²⁴² Trademark for a group of textile processing oils, fat-splitting reagents, and bases for soluble oils.

Twitchell reagent. Catalyst for the Twitchell process (acid hydrolysis of fats). It is a sulfonated addition product of naphthalene and oleic acid, a naphthalenestearosulfonic acid.

"TX."²⁴⁷ Trademark for a hydrous magnesium oxide fiber which has an ultimate temperature resistance of 5070°F . Can be fabricated into reinforced plastic parts for high temperature conditions (e.g., rocket exhaust nozzles, re-entry nose cones).

"Tybek."²¹ Trademark for a high-density polyethylene fiber.

"Tybrene."²³¹ Trademark for a series of acrylonitrile-butadiene-styrene (ABS) resins.

"Tdex."²³¹ Trademark for polyethyleneimine products.

"Tygobond."³²⁶ Trademark for a series of vinyl- and rubber-based adhesives for cementing porous and semiporous materials to each other.

"Tygofil."³²⁶ Trademark for a modified epoxy-base metal filler.

"Tygoflex."³²⁶ Trademark for a plastisol vinyl compound derived from "Tygon." For specialty corrosion protection.

"Tygon."³²⁶ Trademark for a series of vinyl compounds used as linings, coatings, adhesives, tubing, and extruded shapes applied to chemical process equipment as corrosion protection.

"Tygorust."³²⁶ Trademark for a vinyl-based primer for application to damp or dry rusted steel.

"Tygoweld."³²⁶ Trademark for a modified epoxy-base structural adhesive for bonding both similar and dissimilar materials.

"Tygozinc."³²⁶ Trademark for a series of inorganic zinc-rich protective coatings of both self-curing and post-cured types.

"Tylac."⁵¹³ Trademark for a series of synthetic latexes and elastomers.

NBL. High-strength, film-forming nitrile rubber latexes and rubbers and carboxylated polymers characterized by exceptional oil, solvent, and abrasion resistance.

SBL. Butadiene/styrene and carboxylated butadiene/styrene and high styrene latexes of various monomer ratios. Modified versions available.

Uses: Paper, textiles, adhesives, Portland cement, molded products, polyvinyl chloride and phenolic resin blends.

"Tylan."⁵³⁰ Trademark for tylosin phosphate; used as an antibiotic in veterinary medicine.

"Tylose."⁴⁵⁰ Trademark for a wide range of water-soluble cellulose ethers. See methylcellulose, carboxymethylcellulose. Numerous grades and viscosities are available.

Uses: Thickeners, binders, dispersing agent, emulsifiers, protective colloids, lubricants and film forming materials; drilling muds; detergents; textile, paper, print, and varnish industries; ceramics; cosmetics and pharmaceuticals.

tylosin. Antibiotic substance isolated from a strain of *Streptomyces fradiae*.

Properties: Crystals; m.p. 128 – 130°C ; solutions are stable between pH 4 to 9.

Uses: Veterinary medicine.

tyloxapol (USAN) An oxyethylated tert-octylphenol-polyethylene polymer, and essentially nontoxic, nonionic surfactant.

Tyndall effect. A colloidal phenomenon in which particles too small to be resolved in an optical microscope suspended in a gas or liquid reveal their presence by scattering a beam of light as it passes through the suspension, the extent of reflection being dependent of the position of the irregularly shaped particles relative to the incident light. The effect causes the appearance of a visible cone of light through the suspension. This principle is utilized in the ultramicroscope.

"Tynex."²⁸ Trademark for nylon filament. Available tapered with an essentially uniform taper from butt to tip, and also level, i.e., in a wide range of constant diameters. The tapered form used primarily in paint brushes; the level form in other brushes.

type metal. Alloy of 75–95% lead, 2½–18% antimony with a little tin and sometimes copper, which expands slightly upon solidification and produces sharp castings.

"Ty-Ply."²²⁵ Trademark for a family of nontacky vulcanizing adhesives for bonding natural and synthetic rubber compounds.

Tyr Abbreviation for tyrosine.

tyramine (tyrosamine; para-beta-amino-ethylphenol) $\text{HOC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{NH}_2$. A base found in mistletoe, putrefied animal tissues, certain cheeses, and ergot. It is usually made synthetically.

Properties: Colorless crystals; m.p. 164–165°C; soluble in boiling alcohol; slightly soluble in water, benzene, and xylene.

Use: Medicine.

"Tyril."²³³ Trademark for a group of styrene-acrylonitrile copolymers.

"Tyrilfoam" 80.²³³ Trademark for expanded styrene-acrylonitrile for flotation uses under conditions of gasoline spillage, petroleum scum from outboard motors, and stagnant water.

tyrocidine. Antibiotic produced by the metabolic processes of the bacteria, *Bacillus brevis*. It is a cyclic polypeptide which is active against most gram-positive pathogenic bacteria. It is one of the two antibiotic components of tyrothricin (q.v.) but has been isolated and used alone.

Properties (probably the hydrochloride): Fine crystalline needles which decompose at 240°C. Soluble in 95% alcohol, acetic acid and pyridine; slightly soluble in water, acetone and absolute alcohol; insoluble in ether, chloroform and hydrocarbons. Depresses surface tension; forms fairly stable colloidal emulsion in distilled water.

Use: Medicine (usually as component of tyrothricin); possible fungistat and bacteriostat.

tyrosamine. See tyramine.

tyrosinase. An enzyme containing copper which occurs in plant and animal tissue and is responsible for turning peeled potatoes black when exposed to air.

Use: Medicine.

tyrosine (beta-para-hydroxyphenylalanine; alpha-amino-beta-para-hydroxyphenylpropionic acid) $\text{C}_6\text{H}_4\text{OHCH}_2\text{CHNH}_2\text{COOH}$. A nonessential amino acid.

Properties: White crystals, readily oxidized by the animal organism; soluble in water; slightly soluble in alcohol; insoluble in ether; optically active.

DL-tyrosine m.p. 316°C;

D(+)-tyrosine m.p. 310–314°C;

L(–)-tyrosine m.p. 295°C with decomposition; sp. gr. 1.456 (20/4°C).

Derivation: Hydrolysis of protein (casein); organic synthesis.

Grade: F.C.C.

Uses: Growth factor in nutrition; biochemical research; dietary supplement. Available commercially as DL-tyrosine.

tyrothricin. An antibiotic produced by growth of *Bacillus brevis*. It consists of a mixture of antibiotics, principally gramicidin and tyrocidine. Gramicidin is the more active component. Use is generally limited to local external applications. It is active against some gram-positive bacteria, including species of pneumococci, streptococci and staphylococci.

"Tyzine."²⁹⁹ Trademark for tetrahydrozoline hydrochloride.

"Tyzor."²⁸ Trademark for a group of simple and chelated esters of orthotitanic acid such as tetrabutyltitanate of varying reactivity.

Uses: Chemical intermediates; primers for adhesion promotion in extrusion coating; dispersants; catalysts; scratch-resistant finishes on glass; masonry water repellents; cross-linking agents.

U

U Symbol for uranium.

"U-A-S."¹⁹⁷ Trademark for a nitrogen fertilizer solution containing urea, water, and ammonia.
Use: Solid nitrogen-containing fertilizers.

"Ubatol."²² Trademark for a series of fine particle size styrene- and acrylic-based polymer and copolymer emulsions, some less than 0.01 micron. Films deposited from compounded polymer emulsions exhibit high gloss, increased water resistance and durability. Film characteristics of straight polymers range from hard non-film forming to soft-flexible.
Uses: Coatings for paper, leather, textiles, tapes; vehicle for gloss latex paints; self-polishing floor wax, latex compounding, detackifying agents, detergent opacifying agent.

"Ucane."²¹⁴ Trademark for soft detergent alkylates which are anionic in character after sulfonation; derived from the chlorination of n-paraffins and the subsequent alkylation of benzene with these n-paraffin chlorides. Show almost complete biodegradability.

"Ucar."²¹⁴ Trademark for various synthetic organic chemicals including butylene oxide, butylphenol, nonylphenol, triphenol P, bisphenol A, para-tert-amyphenol, ethylene and propylene glycols; also applied to synthetic latexes and water-soluble polymers.

"Ucet."²¹⁴ Trademark for epoxy resin type of wrinkle-resistant finishes for cotton and rayon, and for a type of acetylene black.

"Ucon."²¹⁴ (1) Trademark for a series of nonflammable, low-toxicity fluorocarbon solvents and solvent blends with high chemical stability and extremely low residue levels. Used for cleaning electronic and mechanical instruments and controls, degreasing motors, cleaning liquid oxygen equipment, and motion picture and television film and magnetic tape.

(2) Trademark for polyalkylene glycols and diesters. Available as water-soluble or insoluble products.

Grades: LB-Series, 50-HB Series, 75-H Series, DLB Series and Hydrolube Series.

Uses: High-temperature lubricants, low temperature fluids, compressor lubricants, hydraulic brake fluids, quench fluid, heat transfer fluids, textile lubricants, rock drill lubricants, leather and paper-treating compounds, rubber lubricants, plasticizers and solvents, chemical intermediate; stationary phase in gas chromatography.

See fluorocarbon.

"Udel."²¹⁴ Trademark for biaxially oriented polypropylene film used for overwraps, laminations, box windows, and shrink wraps; also for polysulfone resins.

"Udex."^{231,416} Proprietary process for extracting aromatic hydrocarbons by using a glycol-water mixture as solvent, utilizing a unique countercurrent con-

tacting technique. The aromatic extract is distilled from the solvent and extremely high purity individual aromatics separated from one another by further distillation. The composition of the solvent is readjusted by removing water or other impurities and continually returning solvent to process.

UDP. Abbreviation for uridine diphosphate. See uridine phosphate.

UPPG. Abbreviation for uridine diphosphate glucose.

"UF 71."³¹⁹ Trademark for an aqueous concentrate of 51% formaldehyde by weight stabilized by the addition of 20% urea.

Uses: Urea-formaldehyde resins and nitrogen fertilizers.

"Uformite."²³ Trademark for synthetic resins based on urea-formaldehyde, melamine-formaldehyde, and triazine condensates. Supplied as colorless or light-colored aqueous solutions or solutions in volatile solvents. Solvent type produces hard, alkali-resistant, colorless coatings on curing, with adhesion to a variety of surfaces.

Uses: With alkyd resins in coatings; industrial finishes on appliances, automobiles, etc.; adhesives for paper-board boxes; paper coatings; wet-strength paper; textile pigment binding.

ulexite (cotton balls) $\text{NaCaB}_3\text{O}_6 \cdot 8\text{H}_2\text{O}$. A natural hydrated borate of sodium and calcium.

Properties: Color white; luster silky; Mohs hardness 1-2.5; sp. gr. 1.96; usually found as rounded, loose-textured masses of fine crystals.

Occurrence: Chile; Argentina; California, Nevada.

Use: Source of borax.

Ullman reaction. A modification of the Fittig synthesis (q.v.) in which copper powder is used instead of sodium.

ulmin brown. See Van Dyke brown.

ulmin. One of a class of amorphous substances resulting from the decomposition of the cellulose and lignite tissues of plants. Ulmins represent one of the initial changes by which vegetable matter is converted into coal.

"Ultex."⁹⁴ Trademark for a dithiocarbamate accelerator for natural and synthetic rubbers; suitable for white and light-colored goods.

ultra-accelerator. An unusually powerful accelerator of rubber vulcanization, typified by thiuram sulfides and dithiocarbamates.

"Ultra-Clor."³²⁹ Trademark for a turf fungicide whose active ingredients are mercuric dimethyldithiocarbamate, potassium chromate, and cadmium succinate.
Hazard: Highly toxic by ingestion.

ultramarine blue.

Properties: Inorganic pigment; blue powder; good alkali and heat resistance; low hiding power; poor acid resistance; poor outdoor durability; noncombustible; low toxicity.

Derivation: Heating a mixture of sulfur, clay, alkali, and a reducing agent at high temperatures.

Containers: Barrels; fiber drums; multiwall paper bags.

Uses: Colorant for machinery and toy enamels; white baking enamels; printing inks; rubber products; soaps and laundry blues; cosmetics; textile printing.

Note: Used in very low percentages to intensify whiteness of white enamels, rubber compounds, laundered clothing, etc. by offsetting yellowish undertones; gives a "blue" rather than a "yellow" white.

"Ultramid."⁴⁴⁰ Trademark for nylon 6, nylon 6,6 and nylon 6,10; used in filament and engineering plastics. See nylon.

"Ultrapoles."⁴⁴⁹ Trademark for a series of alkanolamine condensates, detergent base and surface active materials used as detergents and ingredients of detergents, wetting and foaming agents, foam stabilizers, ingredients for cosmetic preparations, emollients, thickening agents.

"UltraSeal."⁵⁰⁶ Trademark for synthetic rubber industrial sealants.

ultrasonics. The science of effects of sound vibrations beyond the limit of audible frequencies. Used for dust, smoke and mist precipitation; preparation of colloidal dispersions; cleaning of metal parts, precision machinery, fabrics, etc.; friction welding; formation of catalysts; degassing and solidification of molten metals; extracting flavor oils in brewing; electroplating; drilling hard materials; fluxless soldering; nondestructive testing. Also used for investigation of physical properties, determination of molecular weights of liquid polymers, degree of association of water, and for inducing chemical reaction. Biological effects are also under study.

"Ultrathene."¹⁹² Trademark for a series of ethylene-vinyl acetate copolymer resins for adhesives, conversion coatings, and thermoplastic modifiers. Wide range of melt indexes. Improves specific adhesion of hot-melt, solvent-based, and pressure-sensitive adhesives.

ultraviolet. Radiation in the region of the electromagnetic spectrum including wavelengths from 100 to 3900 Å. See radiation.

Hazard: Dangerous to eyes; overexposure may cause severe skin burns (sunburn).

Uses: Irradiation of milk; air sterilization in hospitals; microscopy.

ultraviolet absorber. A substance which absorbs radiant energy in the wavelength of ultraviolet (q.v.). The radiant energy absorbed is converted to heat (thermal energy). Ultraviolet absorbers are added to unsaturated substances (plastics, rubbers, etc.) to decrease light sensitivity and consequent discoloring and degradation. Among compounds used are benzophenones, benzotriazoles, substituted acrylonitriles, and phenol-nickel complexes. See also absorption (2).

"Ultrawet."¹³⁶ Trademark for a series of biodegradable linear alkylate sulfonate (LAS) anionic detergents or surface-active agents (linear dodecylbenzene type). Available forms: Sodium or triethanolamine salts in liquid, slurry, flake or bead form.

"Ultra-X Foam Liquid."²⁷⁰ Trademark for a compound used at 1% to 3% in water to produce ultra-

high expansion fire fighting foam. When used in appropriate foam generators, foam expansions as high as 1000 times the liquid volume result. Used for combatting confined flammable liquid and structural fires, for total flooding of basements, mines, warehouses, etc.

umber. A naturally occurring brown earth containing ferric oxide together with silica, alumina, manganese oxides and lime. Raw umber is umber which is ground and then levigated. Burnt umber is umber calcined at low heat.

Uses: Paint pigment; lithographic inks; wall paper (pigment); artists' color.

"Umbrex Fatty Alcohol."⁴⁸⁷ See "CO Fatty Alcohols."

UMP. Abbreviation for uridine monophosphate. See uridine phosphates and also uridylic acid.

"Unads."⁷⁶⁹ Trademark for tetramethylthiuram monosulfide (q.v.).

Use: Ultra-accelerator for rubber.

uncertainty principle. The conclusion of Heisenberg based on quantum mechanical theory that the precise position of a specific electron in an atomic orbit cannot be determined, and that consequently the ultimate nature of matter is not susceptible to objective measurement. The result of this concept was development of the orbital theory, in which electron behavior is dealt with on a statistical basis. Its validity was confirmed by 1930 by the work of other mathematical physicists such as DeBroglie, Fermi and Schrodinger. See also orbital theory; Heisenberg.

gamma-undecalactone (peach aldehyde; gamma-undecyl lactone; 4-hydroxy-undecanoic acid, gamma lactone). $\text{CH}_3(\text{CH}_2)_6\text{CHCH}_2\text{CH}_2\text{COO}$.

Properties: Colorless to light-yellow liquid; peach-like odor. Sp. gr. 0.941–0.944; refractive index 1.450–1.454. Soluble in 4 to 5 vols. of 60% alcohol; soluble in benzyl alcohol, benzyl benzoate, and most fixed oils. Combustible.

Derivation: By heating undecylenic acid in the presence of sulfuric acid.

Grades: Chlorine-free; F.C.C.

Uses: Perfumery; flavoring agent.

undecanal (n-undecylic aldehyde; hendecanal)

$\text{CH}_3(\text{CH}_2)_9\text{CHO}$.

Properties: Colorless liquid; sweet odor; sp. gr. 0.825–0.832 (25°C); refractive index 1.4310–1.4350 (20°C); soluble in oils and alcohol; insoluble in glycerol and water. Flash point 235°F; combustible.

Derivation: By oxidation of 1-undecanol or reduction of undecanoic acid.

Grade: F.C.C.

Hazard: Moderately toxic by ingestion and inhalation; irritant to tissue.

Uses: Perfumery; flavors.

n-undecane (hendecane) $\text{CH}_3(\text{CH}_2)_9\text{CH}_3$.

Properties: Colorless liquid; sp. gr. 0.7402 (20/4°C); f.p. –25.75°C; b.p. 195.6°C; refractive index 1.41725 (n 20/D); flash point 149°F. Combustible.

Grades: 95%; 99%; research.

Containers: Bottles and drums.

Uses: Petroleum research; organic synthesis; distillation chaser.

undecanoic acid (n-undecylic acid; hendecanoic acid) $\text{CH}_3(\text{CH}_2)_9\text{COOH}$. Small amounts occur in castor oil. It is best derived from undecylenic acid by hydrogenation.

Properties: Colorless crystals. Sp. gr. 0.8505 (80/4°C); m.p. 28.5°C; b.p. 284.0°C; 222.2°C (128 mm); refractive index 1.4319 (40°C); insoluble in water; soluble in alcohol and ether.

Grades: Technical; 99%.

Use: Organic synthesis.

1-undecanol (n-undecyl alcohol; decyl carbinol; 1-hendecanol) $\text{CH}_3(\text{CH}_2)_9\text{CH}_2\text{OH}$.

Properties: Colorless liquid with a citrus odor. Sp. gr. 0.829–0.834; refractive index 1.435–1.443; m.p. 19°C. Soluble in 60% alcohol. Flash point about 200°F. Combustible. Low toxicity.

Uses: Perfumery; flavoring.

2-undecanol (2-hendecanol) $\text{CH}_3(\text{CH}_2)_8\text{CHOHCH}_3$.

Properties: Colorless liquid; sp. gr. 0.8363 (20°C); m.p. 12°C; b.p. 228–229°C; insoluble in water; soluble in alcohol and ether. Flash point 235°F. Combustible.

Containers: Drums.

Uses: Antifoaming agent; intermediate; perfume fixatives; plasticizer.

2-undecanone. See methyl nonyl ketone.

undecenal (undecylenic aldehyde; hendecen-1-al).

Listed by different authorities as the 10-undecenal, $\text{CH}_3\text{CH}(\text{CH}_2)_9\text{CHO}$, and the 9-undecenal, $\text{CH}_3\text{CH}:\text{CH}(\text{CH}_2)_8\text{CHO}$.

Properties: Colorless liquid; strong odor suggesting rose; sp. gr. 0.840–0.850 (25/25°C); refractive index 1.4410–1.4470 (20°C). Soluble in 80% alcohol. Combustible. Low toxicity.

Uses: Perfumery; flavoring.

10-undecenoic acid. See undecylenic acid.

10-undecen-1-ol. See undecylenic alcohol.

n-undecyl alcohol. See 1-undecanol.

undecylenic acid (10-undecenoic acid)

$\text{CH}_2:\text{CH}(\text{CH}_2)_8\text{COOH}$.

Properties: Light-colored liquid; fruity-rosy odor. Almost insoluble in water; miscible with alcohol, chloroform, ether, benzene, and with fixed and volatile oils. Congealing point 21°C; sp. gr. (25/25°C) 0.910–0.913; refractive index (25°C) 1.4475–1.4485. Flash point 295°F; combustible; low toxicity.

Derivation: Destructive distillation of castor oil.

Grades: Technical; N.F.

Containers: 6-, 13-gal carboys; 5-, 10-, 50-gal drums.

Uses: Perfumery; flavoring; medicinals; plastics; modifying agent (plasticizer, lubricant additive, etc.).

undecylenic alcohol (n-undecylenic alcohol; 10-undecen-1-ol; alcohol C-11) $\text{CH}_2:\text{CH}(\text{CH}_2)_8\text{CH}_2\text{OH}$.

Properties: Colorless liquid; citrus odor; sp. gr. 0.842–0.847; refractive index n_D 20 1.449–1.454; f.p. –3.0°C; soluble in 70% alcohol. Combustible; low toxicity.

Use: Perfumes.

undecylenic aldehyde. See undecenal.

undecylenyl acetate (10-hendecenyl acetate)

$\text{CH}_3\text{COO}(\text{CH}_2)_8\text{CH}:\text{CH}_2$.

Properties: Colorless liquid; floral-fruity odor. Sp. gr. 0.876–0.883; refractive index 1.438–1.442. Soluble in 80% alcohol. Combustible; low toxicity.

Uses: Perfumery; flavoring.

n-undecylic acid. See undecanoic acid.

u-undecylic aldehyde. See undecanal.

gamma-undecyl lactone. See gamma-undecalactone.

UNH. Abbreviation for uranyl nitrate hydrated. See uranyl nitrate.

unhairing (dehairing). Removal of hair from hides and skins as practised on a commercial scale in the leather industry. Several methods are used, involving application of hydrated lime, dimethylamine, trypsin and other enzymes.

"Unicel."²⁸ Trademark for blowing agents for natural and synthetic rubber sponge.

"Unicor."⁴¹⁶ Trademark for ash-free, oil-soluble, surface active film-former. Used as a corrosion inhibitor in various refinery operations.

"Unicor-LHS" is a film-forming organic phosphate base used also as an anti-icer and carburetor detergent.

"Unisize."¹⁴⁴ Trademark for sizing agents for paper and paperboard.

Properties: Modified polyvinyl alcohol; free-flowing powder; medium-viscosity or high-viscosity solutions; water-soluble.

Containers: 50-lb multiwall bags.

Uses: Single-station surface-sizing agents for paper and paperboard.

"Unisoil."²⁹ Trademark for a colloidal clay. Used as a soil conditioner in sandy or light soils.

"Unisol."^{136,416} Proprietary process for removing mercaptans from gasoline and burning oils by use of caustic methanol solutions. The caustic is separated by decantation and the mercaptans separated by settling; the methanol is distilled from the hydrocarbons. Both chemicals are continuously returned to process.

"Unisorb."⁴¹⁶ Proprietary process for separating hydrocarbon types from each other by adsorption from the liquid phase in a fixed bed of adsorbent at moderate temperatures and pressures.

"Unitane."⁵⁷ Trademark for titanium dioxide (TiO_2) pigment available in both anatase and rutile forms.

"Unithane."²⁷ Trademark for urethane-base compounds.

Uses: Adhesives for bonding or laminating textiles, flocking, textile coating and finishing treatments.

"Unitol."⁴²⁰ Trademark for a series of tall oil fatty acids, distilled tall oil, tall oil rosin, acid-refined tall oils, synthetic crude tall oils, and tall oil pitch.

Uses: Alkyd resins, oleoresinous vehicles, esters, maleic-modified resins, fumaric-modified resins, gloss oils, epoxy resins, polyurethanes, soaps, synthetic detergents, ore flotation, stabilizer-plasticizers, metallic soaps, paper size, rubber processing aids and others.

unit operation. A particular kind of physical change used in the industrial production of various chemicals and related materials. Filtration, evaporation, distillation, fluid flow and heat transfer are examples. See also chemical engineering.

unit process. A process characterized by a particular kind of chemical reaction; oxidation, hydrolysis, esterification, and nitration are examples. See also kinetics, chemical; chemical engineering.

"Univis."⁵¹ Trademark for a series of power transmission or hydraulic oils. They have viscosity indexes

of 150 or higher and pour points of -50°F or lower, permitting wide temperature ranges in operation.

"Univolt."⁵¹ Trademark for oils used as electrical insulating mediums in transformers, switches and some electrical cables. Suitable for transformers, whether used indoors or outdoors or under low-temperature conditions. See also transformer oil.

"Unox" Epoxides.²¹⁴ Trademark for a series of stabilizers and intermediates for plasticizers and resins.

"Unox" Fire-Fighting Penetrant.²¹⁴ Trademark for a wetting agent. Increases the effectiveness of water in extinguishing fires by aiding penetration of dense burning materials, putting out the fire quickly with less smoke, less water damage, and less overhaul.

"Unox Process."²¹⁴ Trademark for an improved method of oxidizing organic wastes by use of oxygen instead of air.

uns- (unsym). Abbreviation for unsymmetrical. A prefix denoting the structure of organic compounds in which substituents are disposed unsymmetrically with respect to the carbon skeleton or to a functional group, such as a double bond. For example, unsdichloroethane is CH_3CHCl_2 .

unsaturation. Of a chemical compound, the state in which not all the available valence bonds are satisfied; in such compounds the extra bonds usually form double or triple bonds (chiefly with carbon). Thus unsaturated compounds are more reactive than saturated compounds, as other elements readily add to the unsaturated linkage. An unsaturated compound (ethylene, C_2H_4 , butadiene, C_4H_6 , benzene, C_6H_6) has fewer hydrogen atoms or equivalent groups than the corresponding saturated compound (ethane, C_2H_6 , butane, C_4H_{10} , cyclohexane, C_6H_{12}).

In structural formulas unsaturation may be represented by parallel lines joining the carbon atoms (ethylene, $\text{H}_2\text{C}=\text{CH}_2$, butadiene $\text{H}_2\text{C}=\text{CHCH}=\text{CH}_2$) or by colons or triple dots, $\text{H}_2\text{C}:\text{CH}_2$ $\text{H}_2\text{C}:\text{CH}_2$ (ethylene) and $\text{HC}:\text{CH}$ (acetylene).

"UOP."⁴¹⁶ Designation for a broad group of antioxidants and related products especially designed for use in motor fuels, lubricating oils and greases. Among other things they inhibit gum formation and tetraethyllead decomposition in high-octane gasolines.

"Urab."⁵⁰ Trademark for a complex of fenuron and TCA, available in liquid concentrate, granular, and pelleted formulations. A brush and weed killer for control of woody plants and deep-rooted weeds in noncrop land.

"Urac."⁵⁷ Trademark for products based on urea-formaldehyde condensates used mainly as adhesives for the production of moisture-proof bonds in plywood manufacture, plywood assembly, and furniture manufacture.

uracil $\text{HNC}(\text{O})\text{NHC}(\text{O})\text{CHCH}$ (2,4-Dioxypyrimidine). A pyrimidine that is a constituent of ribonucleic acids and the coenzyme, uridine diphosphate glucose (q.v.).

Properties: Crystalline needles; m.p. 335°C (dec). Soluble in hot water, ammonium hydroxide and other alkalis; insoluble in alcohol and ether.

Derivation: Hydrolysis of nucleic acids; precipitation

from urea and ethyl formylacetate. Radioactive forms available.

Use: Biochemical research.

uracil-6-carboxylic acid. See orotic acid.

"Uracil Mustard."³²⁷ Trademark for 5-[bis(2-chloroethyl)amino]uracil.

uracil, D-ribosyl. See uridine.

"Urafil."⁵³⁹ Trademark for a glass fiber-reinforced urethane.

"Ura-Green."⁵³³ Trademark for non-pressure nitrogen solutions.

"Uramite."²⁸ Trademark for a fertilizer derived from urea-formaldehyde containing 38% nitrogen.

"Uramon."²⁸ Trademark for solutions of urea in aqueous ammonia; used in manufacture of mixed fertilizers.

"Uran."¹⁹⁷ Trademark for a series of nitrogen solutions containing water, ammonium nitrate, and urea. They are used as solutions for direct application to the soil and in manufacture of complete liquid fertilizers.

"Urana."¹⁹⁷ Trademark for a series of nitrogen solutions containing water, ammonium nitrate, urea, and ammonia. These solutions are used in the manufacture of solid fertilizers having special handling properties.

urania. See uranium dioxide.

urania-thoria. Crystals of the mixed oxides of uranium and thorium are available. Used as nuclear fuel. The crystals are denser and cheaper than the pellet form.

uranic chloride. See uranium tetrachloride.

uranic oxide. See uranium dioxide.

uranine (uranine yellow; sodium fluorescein; resorcinolphthalein sodium) $\text{Na}_2\text{C}_{20}\text{H}_{10}\text{O}_5$. Colour Index No. 45350.

Properties: Orange red, odorless powder; hygroscopic; soluble in water and sparingly soluble in alcohol.

Derivation: By treatment of fluorescein with sodium carbonate solution and crystallizing.

Method of purification: Recrystallization.

Grades: Technical; U.S.P. (as sodium fluorescein).

Containers: Custom-packed.

Uses: Dyeing silk and wool yellow; tracing subterranean waters; marking water for air-sea rescues; clinical test solution.

uraninite UP_2 . A natural oxide of uranium usually partly oxidized to UO_3 , with variable amounts of lead, radium, thorium, rare earth metals, helium, argon, and nitrogen. Pitchblende is an important variety.

Occurrence: Colorado, Utah, South Africa, Canada, Europe, Congo, U.S.S.R.; Australia.

Use: Source of uranium and radium.

uranium U Metallic element number 92, a member of the actinide series. Atomic weight 238.029; valences 3, 4, 6. Three natural radioactive isotopes: U-234 (0.006%), U-235 (0.7%), and U-238 (99%). (See separate entries for details).

Properties: Dense, silvery solid; strongly electropositive; ductile and malleable; poor conductor of electricity; sp. gr. 19.0; m.p. 1132°C ; b.p. 3818°C ; heat

of fusion 4.7 kcal/mole; heat capacity 6.6 cal/mole/°C. Forms solid solutions (for nuclear reactors) with molybdenum, niobium, titanium and zirconium. The metal reacts with nearly all nonmetals. It is attacked by water, acids, and peroxides; but is inert towards alkalis. Green tetravalent uranium and yellow uranyl ion (UO_2^{++}) are the only species which are stable in solution.

Occurrence: Pitchblende (essentially UO_2), a variety of uraninite, coffinite (USiO_4) and carnotite (Colorado, Canada, Congo, So. Africa, Australia, USSR). **Derivation:** Finely ground ore is leached under oxidizing conditions to give uranyl nitrate solution. The uranyl nitrate, purified by solvent extraction (ether, alkyl phosphate esters), is then reduced with hydrogen to uranium dioxide. This is treated with hydrogen fluoride to obtain uranium tetrafluoride, followed by either electrolysis in fused salts or by reduction with calcium or magnesium. Uranium can also be recovered from phosphoric acid by a recently developed process (1973). U.S. reserves are estimated to be about 500,000 tons.

Forms available: Solid pure metal; alloys; powder (99.7%).

Hazard: Highly toxic radioactive material; source of ionizing radiation. Tolerance (including metal and all compounds, as U), 0.2 mg per cubic meter of air. (Powder) Dangerous fire risk; ignites spontaneously in air.

Uses: Nuclear fuel; source of fissionable isotope 235; source of plutonium by neutron capture; electric power generation.

See also enrichment (2); uranium compounds.

uranium-233 (U-233). A fissionable isotope of uranium produced artificially by bombarding thorium with neutrons. Used as an atomic fuel in molten salt reactor and is a possible fuel in breeder reactors. Half-life 1.62×10^5 years.

uranium-234 (U-234): A natural isotope of uranium with half-life of 2.48×10^5 years; it is separated by extraction with trioctylphosphine oxide. Used in nuclear research, with potential use in fission detectors for counting fast neutrons.

uranium-235 (U-235). The readily fissionable isotope of uranium used to enrich natural uranium in nuclear fuels. It is present in uranium only to the extent of 0.7%, and can be separated from it by any of several methods: the gaseous diffusion process using uranium hexafluoride, the gas centrifuge process, and the electromagnetic separation method. Its half-life is 7.13×10^8 years. It was the energy source used in the original atom bomb. See also fission; uranium.

uranium-238 (U-238). The abundant isotope of uranium, of which it comprises 99%. It is not fissionable, but will form plutonium-239 as a result of bombardment by neutrons in a reactor. Its half-life is 4.51×10^9 years. It will be used in breeder reactors, together with plutonium, where its energy potential will be exploited by transmuting it to fissionable plutonium. See also breeder.

uranium compounds. Before the advent of nuclear energy, uranium had very limited uses. It has been suggested for filaments of lamps. A small tube of uranium dioxide, UO_2 , connected in series with the tungsten filaments of large incandescent lamps used for photography and motion pictures, tends to eliminate the sudden surge of current through the bulbs when the light is turned on, thereby extending their life. Compounds of uranium have been used in photography for toning, and in the leather and wood

industries uranium compounds have been used for stains and dyes. Uranium salts are mordants of silk or wool. In making special steels, a little ferro-uranium has been utilized, but its value is questionable in this connection. Such alloys have not proved commercially attractive. In the production of ceramics, sodium and ammonium diuranates have been used to produce colored glazes.

Uranium carbide has been suggested as a good catalyst for the production of synthetic ammonia. Uranium salts in small quantities are claimed to stimulate plant growth, but large quantities are clearly poisonous to plants.

By far the most important use of uranium lies in its application for nuclear (or atomic) energy. This use, in fact, has so increased the value of uranium as to eliminate its use for many of the purposes mentioned above.

Glenn T. Seaborg
("Encyclopedia of Chemical Elements," ed. by C. A. Hampel)

uranium decay series (uranium-radium series). The series of elements produced as successive intermediate products when the element uranium undergoes spontaneous natural radioactive disintegration into lead. Radium and radon are members of this series.

uranium, depleted. Uranium from which most of the U-235 isotope has been removed. See uranium-238.

uranium dicarbide (uranium carbide) UC_2 .

Properties: Gray crystals; sp. gr. 11.28 (18°C); m.p. 2350°C; b.p. 4370°C. Decomposes in water; slightly soluble in alcohol.

Hazard: Highly toxic; radiation risk.

Use: As crystals, pellets, or microspheres for nuclear reactor fuel.

uranium dioxide (uranium oxide; uranic oxide; urania) UO_2 .

Properties: Black crystals, insoluble in water, soluble in nitric acid and concentrated sulfuric acid; sp. gr. 10.9; m.p. $3000 \pm 200^\circ\text{C}$.

Derivation of pure oxide: Powdered uranium ore is digested with hot nitric-sulfuric acid mixture and filtered to remove the insoluble portion. Sulfate is precipitated from the solution with barium carbonate and uranyl nitrate is extracted with ether. After re-extraction into water, it is heated to drive off nitric acid, leaving uranium trioxide. The latter is reduced with hydrogen to the dioxide. Can also be prepared from uranium hexafluoride by treating with ammonia and subsequent heating of the ammonium diuranate.

Hazard: Highly toxic; radiation risk. Ignites spontaneously in finely divided form.

Uses: A crystalline (or pellet) form is used to pack nuclear fuel rods.

uranium, enriched. Natural uranium to which a few percent of the fissionable 235 isotope has been added. See also enrichment.

uranium hexafluoride UF_6 .

Properties: Colorless volatile crystals; sublimes; triple point 64.0°C (1134 mm); m.p. 64.5°C (2 atm); sp. gr. 5.06 (25°C); soluble in liquid bromine, chlorine, carbon tetrachloride, sym-tetrachloroethane and fluorocarbons. Reacts vigorously with water, alcohol, ether, and most metals. Vapor behaves as nearly perfect gas.

Derivation: (1) Triuranium octoxide (U_3O_8) and nitric acid react to form solution of uranyl nitrate; this is decomposed to UO_3 and reduced to the dioxide

with hydrogen. The dioxide as a fluidized bed is reacted with hydrogen fluoride. The resulting tetrafluoride is fluorinated to the hexafluoride. (2) Triuranium octoxide is converted directly to the hexafluoride with hydrogen fluoride and fluorine, then purified by fractional distillation.

Hazard: Highly toxic and corrosive. Radiation risk.

Use: Gaseous diffusion process for separating isotopes of uranium.

uranium hydride UH_3 .

Properties: Brown gray to black powder; sp. gr. 10.92; conductor of electricity.

Derivation: Action of hydrogen on hot uranium.

Hazard: Highly toxic; ignites spontaneously in air.

Uses: Preparation of finely divided uranium metal by decomposition; separation of hydrogen isotopes; reducing agent; laboratory source of pure hydrogen.

uranium monocarbide (uranium carbide) UC .

Properties: Lumps or powder that can be formed into desired shapes by powder metallurgy or arc-melt casting; m.p. 2375°C ; density 13.63 g/cc; thermal conductivity 0.08 cal/sec/cm $_2$ /°C/cm; must be stored in inert atmosphere.

Hazard: Radioactive poison.

Use: Nuclear reactor fuel.

uranium tetrafluoride (green salt) UF_4 .

Properties: Green, nonvolatile crystalline powder; sp. gr. 6.70; m.p. 1036°C ; insoluble in water.

Derivation: Treatment of uranium dioxide with hydrogen fluoride. See uranium hexafluoride.

Hazard: Highly toxic and corrosive; radioactive poison.

Use: Intermediate in preparation of uranium metal.

uranocene (bis-cyclooctatetraenyluranium). A synthetic metallocene "sandwich" molecule whose unique feature is that the pi-molecular orbitals of the large organic rings share electrons with f-atomic orbitals of the uranium. See also metallocene.

uranyl nitrate (uranium nitrate; UNH ; yellow salt) $\text{UO}_2(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Yellow, rhombic crystals. Sp. gr. 2.807; m.p. 60.2°C ; b.p. 118°C . Soluble in water, alcohol, and ether.

Derivation: Action of nitric acid on uranium octoxide (U_3O_8).

Hazard: Highly toxic; severe fire and explosion risk when shocked or heated, and in contact with organic materials.

Uses: Source of uranium dioxide; extraction of uranium into non-aqueous solvents.

Shipping regulations: (Rail) Radioactive and Yellow label. (Air) Oxidizer label. Consult regulations for radioactive label.

urban waste. As conventionally used, this term includes garbage, cellulose, glass, etc., but not sewage (municipal waste). In some localities the organic portion, mixed with oil, is being used for fuel.

urea (carbamide) $\text{CO}(\text{NH}_2)_2$. Occurs in urine and other body fluids. The first organic compound to be synthesized (Wohler, 1824).

Properties: White crystals or powder, almost odorless; saline taste; sp. gr. 1.335; m.p. 132.7°C ; decomposes before boiling. Soluble in water, alcohol and benzene; slightly soluble in ether, almost insoluble in chloroform. Low toxicity. Noncombustible.

Derivation: Liquid ammonia and liquid carbon diox-

ide at 1750–3000 psi and 160 – 200°C react to form ammonium carbamate, $\text{NH}_4\text{CO}_2\text{NH}_2$, which decomposes at lower pressure (about 80 psi) to urea and water. Several variations of the process include once-through, partial recycle, and total recycle.

Method of purification: Crystallization.

Grades: Technical; C.P.; U.S.P.; fertilizer (45–46% nitrogen); feed grade (about 42% nitrogen).

Containers: 80-, 100-lb bags; 100-, 225-lb drums. Solution in tank cars and tank trucks.

Uses: Fertilizer; animal feed; plastics; chemical intermediate; stabilizer in explosives; medicine; adhesives; separation of hydrocarbons (as urea adducts); sulfamic acid production; flameproofing agents; viscosity modifier for starch or casein-based paper coatings; reported helpful in treating sickle-cell anemia.

See also urea-formaldehyde resin.

urea adduct. See inclusion complex.

urea ammonia liquor. A solution of crude urea in aqueous ammonia containing ammonium carbamate.

Containers: Tank cars.

Use: Reaction with superphosphate in preparation of fertilizers, furnishing combined nitrogen.

urea-ammonium orthophosphate. A fertilizer developed especially for food-deficient regions, especially rice-dependent areas. Several grades contain all three primary plant nutrients (nitrogen, phosphorus, and potassium). Contains up to 60% nitrogen, phosphoric anhydride, and potassium oxide.

urea-ammonium polyphosphate. A fertilizer similar to urea-ammonium orthophosphate (q.v.), except that about half the phosphorus is in polyphosphate form, which gives improved sequestering action and solubility. It is excellent for use as a liquid fertilizer.

ureaform. A urea-formaldehyde reaction product that contains more than one molecule of urea per molecule of formaldehyde. It can be used as a fertilizer because of its high nitrogen content, its insolubility in water and its gradual decomposition in the soil during the growing season to yield soluble nitrogen.

urea-formaldehyde resin. An important class of amino resin. Urea and formaldehyde are united in a two-stage process in the presence of pyridine, ammonia, or certain alcohols with heat and control of pH to form intermediates (methylolurea, dimethylolurea) that are mixed with fillers to produce molding powders. These are converted to thermosetting resins by further controlled heating and pressure in the presence of catalysts. These were the first plastics that could be made in white, pastel, and colored products; widely used for scale housings, lamp shades, dinnerware and other decorative household applications; also plywood for interior use; foundry core binder.

Uses: See amino resin; melamine resin; "Plaskon."

urea half-chloride $(\text{NH}_2\text{CONH}_2)_2 \cdot \text{HCl}$.

Properties: Practically white, odorless powder. Very soluble in water.

Use: Catalyst.

urea hydrogen peroxide. See urea peroxide.

urea nitrate $\text{CO}(\text{NH}_2)_2 \cdot \text{HNO}_3$.

Properties: Colorless crystals. Decomposes 152°C . Slightly soluble in water, soluble in alcohol. Low toxicity.

Derivation: By adding an excess of nitric acid to a strong aqueous solution of urea.

Hazard: Dangerous fire and explosion risk.

Use: Explosives; manufacture of urethane (q.v.).

Shipping regulations: Dry or wet with less than 10% water: (Rail) Consult regulations. (Air) Not acceptable. Wet with not less than 10% water: (Rail) Yellow label. (Air) Flammable Solid label.

urea peroxide (urea hydrogen peroxide; percarbamide; carbamide peroxide) $\text{CO}(\text{NH}_2)_2 \cdot \text{H}_2\text{O}_2$.

Properties: White crystals or crystalline powder; m.p. (dec) 75–85°C. Decomposed by moisture at temperatures above 40°C. Soluble in water, alcohol, and ethylene glycol. Solvents such as ether and acetone extract the hydrogen peroxide and may form explosive solutions. Active oxygen (min) 16%.

Grades: Technical; sometimes compounded with waxes in pellet form.

Containers: 100-lb fiber drums.

Hazard: Dangerous fire risk in contact with organic materials; strong oxidizing agent. Moderately irritant.

Uses: Source of water-free hydrogen peroxide; bleaching; disinfectant; cosmetics; pharmaceuticals; blue print developer; modification of starches.

Shipping regulations: (Rail) Yellow label. (Air) Organic peroxide label.

urea phosphoric acid. See carbamide phosphoric acid.

urea-quinine. See quinine-urea hydrochloride.

urease. Enzyme present in the soy bean and in urine, and secreted by certain microorganisms. Its principal use is in the determination of urea in urine and in blood. It splits urea into ammonia and carbon dioxide or ammonium carbonate.

"Urecholine."¹²³ Trademark for bethanechol chloride.

"Urepan."⁴⁷⁰ Trademark for urethane rubbers which have to be crosslinked with isocyanates or peroxides.

urethane (ethyl carbamate; ethyl urethane)

$\text{CO}(\text{NH}_2)\text{OC}_2\text{H}_5$. Its structure is typical of the repeating unit in polyurethane resins.

Properties: Colorless crystals or white powder; odorless; saltpeter-like taste; solutions neutral to litmus. Soluble in water, alcohol, ether, glycerol and chloroform; slightly soluble in olive oil. Sp. gr. 0.9862; m.p. 49°C; b.p. 180°C. Combustible.

Derivation: (a) By heating ethyl alcohol and urea nitrate at 120–130°C; (b) by action of ammonia on ethyl carbonate or ethyl chloroformate.

Grades: Technical; N.F.

Containers: 55-gal steel drums; 250-lb fiber drums.

Hazard: Toxic by ingestion.

Uses: Intermediate for pharmaceuticals, pesticides and fungicides; biochemical research; medicine; veterinary medicine.

See also polyurethane.

urethane alkyd (uralkyd). A urethane resin modified with a drying oil (linseed or safflower) for use in high-quality paints.

uric acid (lithic acid; uric oxide; 2,6,8-trioxypurine)

also be written in phenolic form. The end-product of purine metabolism in man and other primates, birds and some dogs and reptiles.

Properties: Odorless, tasteless, white crystals. Soluble in hot concentrated sulfuric acid; very slightly solu-

ble in water; insoluble in alcohol and ether; soluble in glycerol, solutions of alkali hydroxides, sodium acetate, and sodium phosphate. Sp. gr. 1.855–1.893; m.p., decomposes.

Derivation: From guano.

Grades: Technical; reagent.

Hazard: Evolves highly toxic hydrogen cyanide when heated.

Use: Organic synthesis.

See also pyrine.

uridine (D-ribosyl uracil) $\text{C}_9\text{H}_{12}\text{N}_2\text{O}_6$. The nucleoside of uracil. It is a constituent of ribonucleic acid and some coenzymes (such as uridine diphosphate glucose).

Properties: White, odorless powder, of slightly acid and faintly sweet taste; m.p. 165°C; soluble in water, acid, and base; slightly soluble in dilute alcohol; insoluble in strong alcohol.

Derivation: From nucleic acid hydrolyzates from yeast. Radioactive forms available.

Use: Biochemical research.

uridine diphosphate glucose (UDPG). A coenzyme which acts in the transfer of glucose from the coenzyme to another chemical compound during the reaction for which the coenzyme is a catalyst. Used in biochemical research.

uridine monophosphate. See uridylic acid.

uridine phosphate. A nucleotide used by the body in growth processes; important in biochemical and physiological research. Those isolated and commercially available (as sodium salts) are the monophosphate (UMP), the diphosphate (UDP), and the triphosphate (UTP).

See also uridine diphosphate glucose (UDPG).

uridine-phosphoric acid. See uridylic acid.

uridylic acid (uridine phosphoric acid; UMP; uridine monophosphate) $(\text{C}_9\text{H}_{13}\text{N}_2\text{O}_9\text{P})$. The monophosphoric ester of uracil; i.e., the nucleotide containing uracil, D-ribose and phosphoric acid. The phosphate may be esterified to either the 2,3, or 5 carbon of ribose, yielding uridine-2'-phosphate, uridine-3'-phosphate, and uridine-5'-phosphate, respectively.

Properties (uridine-3'-phosphate): Crystallizes in prisms from methanol. M.p. 202°C (dec). Freely soluble in water and alcohol. Dextrorotatory in solution.

Derivation of commercial product: From yeast ribonucleic acid. Also made synthetically. Radioactive forms available.

Use: Biochemical research.

"Uritone."³³⁰ Trademark for methenamine. See hexamethylenetetramine.

uronic acid. Any of a class of compounds similar to sugars but differing from them in that the terminal carbon has been oxidized from an alcohol to a carboxyl group. The most common are galacturonic acid and glucuronic acid.

"Urox."⁵⁰ Trademark for a soil sterilant herbicide developed for general weed control in non-crop areas. Contains monuron trichloroacetate.

Properties: Low toxicity; miscible with kerosene, fuel oil, diesel oil, aromatic weed oil, liquid asphalts and tars. Available in granular and liquid oil concentrate form.

ursin. See arbutin.

urushiol. Mixture of catechol derivatives.

Properties: Pale yellow liquid; sp. gr. 0.968; b.p.

200°C. Soluble in alcohol, ether, and benzene.

Derivation: Poison ivy (*Rhus toxicodendron*).

Hazard: The toxic principle of poison ivy. Causes severe allergic dermatitis.

USAN. Abbreviation for United States Adopted Name, a nonproprietary name approved by the American Pharmaceutical Association, American Medical Association, and the U.S. Pharmacopeia. Such names applied to pharmaceutical products do not imply endorsement; their use in advertising and labeling is required by law.

USDA. Abbreviation for United States Department of Agriculture, the Federal regulatory authority for meats and meat products. This department maintains Regional Laboratories for agricultural and food research and development located in Philadelphia, Peoria, New Orleans, and Albany (Cal.) Its central office is in Washington, D.C.

usnic acid (usnic acid) $C_{18}H_{16}O_7$. A tricyclic compound. A constituent of many lichens. Known in *d*-, *l*-, and *dl*-forms.

Properties: Crystalline yellow solid; melting range 192–203°C. Insoluble in water; slightly soluble in alcohol and ether.

Derivation: From *Usnea barbata*, a lichen growing on trees.

Use: Medicine (antibiotic).

U.S.P. Abbreviation for United States Pharmacopeia, the official publication for drug product standards. The 18th edition appeared in 1970.

UTP. See uridine phosphate.

"Uversoft."¹³⁴ Trademark for softening agents for fabrics and paper products. Based on a quaternary ammonium salt containing two long straight chain hydrocarbon chains attached to the nitrogen atom. Are cationic and substantive to cellulose.

"Uversol."¹³⁴ Trademark for metal salts of naphthenic acids. Available as solids and liquids of most of the common metals. Used as paint driers, wetting agents, catalysts, etc.

"Uvinul."³⁰⁷ Trademark for ultraviolet light absorbers (q.v.).

Uses: Effective in the range of 200–400 millimicrons. They do not darken or decompose upon prolonged exposure to an intense ultraviolet source. The absorbed energy is not re-emitted in the visible spectrum. Typical applications include protection of plastics, oils, cosmetics, paper, wood, and leather.

"Uvitex."⁴⁴³ Trademark for optical brighteners for textile fibers, plastics, etc.

V

V Symbol for vanadium.

"V-25."¹ Trademark for a dicalcium phosphate dihydrate, finely milled and air-floated so that 99.5% passes a 325-mesh screen.
Grade: F.C.C.

vacancy. See hole.

vacuum deposition. The process of coating a base material by evaporating a metal under high vacuum and condensing it on the surface of the material to be coated, which is usually another metal or a plastic. Aluminum is most commonly used for this purpose. The coatings obtained range in thickness from 0.01 to as much as 3 mils. A vacuum of about one-millionth atmosphere is necessary. The process is used for jewelry, electronic components, decorative plastics, etc. Thermally evaporated metals and dielectric coatings can be effectively applied to glass by this method. It is also called vacuum coating and vacuum metallizing.

vacuum distillation. Distillation at a pressure less than atmospheric but not so low that it would be classed as molecular distillation. Since lowering the pressure also lowers the boiling point, vacuum distillation is useful for distilling high-boiling and heat-sensitive materials such as heavy distillates in petroleum, fatty acids, vitamins, etc.

vacuum forming (thermoforming). Shaping a thermoplastic sheet to the exact contours of a mold by application of vacuum. The sheet is first heated above its softening point (250 to 450°F); it is then placed in a male or female mold. Vacuum is then applied, which acts through channels in the base of the mold; the force thus exerted causes the sheet to assume the shape of the mold. After cooling below its softening point, the formed sheet is removed. Plastics most widely used for this process are polystyrene, acrylics, vinyls, polyethylene, polypropylene and celluloses.

Val Abbreviation for valine.

"Valcar 85."⁴⁹⁶ Trademark for polyester dye carriers.

"Valchrome CA."⁴⁹⁶ Trademark for a chromium acetate solution; used as a mordant for dyeing and printing.

"Valclene."²³ Trademark for clear fluorocarbon formulations with slight ethereal odor; nonflammable. Used as drycleaning fluids.

"Valdet."⁴⁹⁶ Trademark for a series of detergents. 561. Ethylene oxide condensate of nonyl phenol. AC-40, CC. Amine condensate.

Uses: Wetting agent; emulsifying; leveling; dispersing; antistatic agent; multipurpose detergent for dyeing, bleaching, scouring, washing after printing; anionic synthetic detergents; kier boiling aids.

valence. A whole number which represents or denotes the combining power of one element with another. By balancing these integral valence numbers in a given compound, the relative proportions of the elements

present can be accounted for. If hydrogen and chlorine both have a valence of 1, oxygen 2, and nitrogen 3, the valence-balancing principle gives the formulas HCl, H₂O, NH₃, Cl₂O, NCl₃, and N₂O₃, which indicate the relative numbers of atoms of these elements in compounds which they form with each other. In inorganic compounds it is necessary to assign either a positive or negative value to each valence number, so that valence-balancing will give a zero sum by algebraic addition. Negative numbers are called polar valence numbers (-1 and -2). The valence of chlorine may be -1, +1, +3, +5, and +7, depending on the type of compound in which it occurs. In organic chemistry only nonpolar valence numbers are used. See also chemical bonding; oxidation; oxidation number; coordination number.

valentinite (antimony trioxide, ortho-rhombic; white antimony) Sb₂O₃. White or gray mineral, sometimes pale red. White streak and adamantinite or silky luster. Sp. gr. 5.57-5.76; Mohs hardness 2-3.

Occurrence: Algeria; Yugoslavia; Italy; Germany.

Use: Ore of antimony.

valeral. See n-valeraldehyde.

n-valeraldehyde (valeric aldehyde; valeral; amyl aldehyde; pentanal) CH₃(CH₂)₄CHO.

Properties: Colorless liquid; sp. gr. 0.8095; (20/4°C); f.p. -91°C; b.p. 102-103°C; refractive index (n_D²⁰) 1.3944; flash point (closed cup) 54°F. Slightly soluble in water; soluble in alcohol and ether. Low toxicity. See also isovaleraldehyde.

Derivation: Oxidation of amyl alcohol; also by the Oxo process.

Hazard: Flammable, dangerous fire risk.

Use: Flavoring; rubber accelerators.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable liquid label.

valerianic acid. See n-valeric acid.

valerian oil.

Properties: Yellowish or brownish liquid; penetrating odor. Soluble in alcohol, ether, chloroform, acetone, benzene, and carbon disulfide. Sp. gr. 0.903-0.960; refractive index (n_D²⁰) about 1.486. Combustible. Low toxicity.

Chief constituents: Pinene, camphene, borneol, and esters of borneol and valeric acid.

Derivation: Distilled from roots and rhizome of *Valeriana officinalis*.

Uses: Medicine; tobacco perfume; industrial odorant; flavors.

valeric acid (valerianic acid; n-pentanoic acid)

CH₃(CH₂)₄COOH.

Properties: Colorless liquid; penetrating odor and taste; sp. gr. 0.9394 (20/4°C); b.p. 185.4°C; refractive index 1.4081 (20°C); b.p. 185.4°C; refractive index 1.4081 (20°C); vapor pressure 0.08 mm (20°C); f.p. -34°C; flash point 205°F (open cup); soluble in water; soluble in alcohol and ether. Undergoes reactions typical of normal monobasic organic acids. Combustible. See also isovaleric acid.

Derivation: With other C_5 acids by distillation from valerian; by oxidation of n-amyl alcohol; numerous essential oils.

Grades: Technical; reagent.

Containers: Drums; tank cars.

Hazard: Strong irritant to skin and tissue.

Uses: Intermediate for flavors and perfumes; ester-type lubricants; plasticizers; pharmaceuticals; vinyl stabilizers.

Shipping regulations: Corrosive label. (Air)

valeric aldehyde. See n-valeraldehyde.

gamma-valerolactone $CH_3CHCH_2CH_2C(O)O$.

Properties: Colorless liquid. Sp. gr. (25/25°C) 1.0518; b.p. 205–206.5°C; crystallizing point –37°C; flash point (COC) 205°F; refractive index (25°C) 1.4301. Surface tension (25°C) 39 dynes/cm; viscosity (25°C) 2.18 cp; pH, anhydrous 7.0; pH 10% solution in distilled water 4.2; miscible with water and most organic solvents, resins, waxes, etc. Slightly miscible with zein, beeswax, petrolatum. Not miscible with anhydrous glycerin, glue, casein, arabic gum, and soybean protein. Combustible; low toxicity.

Uses: In dye baths (coupling agent), brake fluids, cutting oils, and as solvent for adhesives, insecticides and lacquers.

valine (alpha-aminoisovaleric acid)

$(CH_3)_2CHCH(NH_2)COOH$. An essential amino acid. **Properties:** White crystalline solid; soluble in water; very slightly soluble in alcohol; insoluble in ether. Shows the following optical isomers:

DL-valine: M.p. 298°C with decomposition.

D-valine (natural isomer): M.p. 315°C with decomposition.

L-valine: M.p. 293°C with decomposition.

Derivation: Hydrolysis of proteins; synthesized by the reaction of ammonia with alpha-chloroisovaleric acid. Available commercially as D-, L-, or DL-valine.

Containers: Drums.

Uses: Medicine; dietary supplement; culture media; biochemical and nutritional investigations.

"Valium."¹⁹⁰ Trademark for diazepam (q.v.).

"Valkleer 5722."⁴⁹⁶ Trademark for emulsifiable resin solvent blend for printing with pigment colors.

"Vallestril."⁷⁰ Trademark for methallenestril (q.v.).

"Valmine SA."⁴⁹⁶ Trademark for an organic amine salt of a volatile acid. Used as a protective agent to keep fabrics from tendering when printing with aniline black.

"Valpen NC."⁴⁹⁶ Trademark for an organic sodium sulfonate; used as a mercerizing agent.

"Valrez."⁴⁹⁶ Trademark for a series of wash and wear resins, many of which are urea derivatives or modified urea-formaldehyde resins.

"Valron."²⁸ Trademark for a solution of urea and formaldehyde in water; used for making fertilizers.

"Valsof."⁴⁹⁶ Trademark for a series of polyethylene emulsions; used as fabric softeners.

"Valspex" A-115, N-123."⁴⁹⁶ Trademark for polyethylene emulsions with 1% emulsifier content; used to increase abrasion resistance, tear and tensile strength of textiles.

"Valstat" E."⁴⁹⁶ Trademark for a modified fatty condensate; used as an antistatic agent for synthetics, cotton and as a napping assistant.

"Valsyl."⁴⁹⁶ Trademark for nylon and polyester sizing agents.

"Valwax."⁴⁹⁶ Trademark for a series of textile lubricants.

"Valwet."⁴⁹⁶ Trademark for a series of wetting agents for textile industry.

092. Fortified alkylarylsulfonate blend.

RW. Sulfonated alkyl ester; used in rewetting and compressive shrinking.

"Valzopon ON."⁴⁹⁶ Trademark for a polyoxyethylated fatty alcohol. Used as a dispersing agent to improve crockfastness of naphthol dyeings; stabilizer for color salts.

vanadic acid (a) metal-HVO₃; (b) ortho-H₃VO₄; (c) pyro-H₄V₂O₇ These acids apparently do not exist in the pure state, but are represented in the various alkali and other metal vanadates. Ordinarily, vanadic acid implies vanadium pentoxide (vanadic acid anhydride).

vanadic acid anhydride. See vanadium pentoxide.

vanadic sulfate. See vanadyl sulfate.

vanadic sulfide. See vanadium sulfide.

vanadinite Pb₃Cl(VO₃). A natural chlorovanadate of lead.

Properties: Color ruby red, orange red, brown, yellow; luster resinous to adamantine; Mohs hardness 3; sp. gr. 6.7–7.1. Soluble in strong nitric acid.

Occurrence: New Mexico, Arizona; Africa; Scotland; U.S.S.R.

Use: Ore of vanadium and lead.

vanadium V Metallic element having atomic number 23; Group VB of the periodic system. Atomic weight 50.94; valences 2, 3, 4, 5. Two natural isotopes.

Properties: Silvery-white ductile solid. Insoluble in water; resistant to corrosion, but soluble in nitric, hydrofluoric, and concentrated sulfuric acids; attacked by alkali, forming water-soluble vanadates. Sp. gr. 6.11; m.p. 1900 ± 25°C; b.p. ca. 3000°C. Acts as either a metal or a nonmetal, and forms a variety of complex compounds. Nontoxic as metal.

Source: Not found native. Principal ores are patronite, roscoelite, carnotite and vanadinite. Also from phosphate rock (Idaho, Montana, Arkansas).

Occurrence: Colorado, Utah, New Mexico, Arizona; Mexico and Peru.

Derivation: (a) Calcium reduction of vanadium pentoxide yields 99.8+% pure ductile vanadium. (b) Aluminum, cerium, etc. reduction produces a less pure product. (c) Solvent extraction of petroleum ash or ferrophosphorus slag from phosphorus production. (d) Electrolytic refining using a molten salt electrolyte containing vanadium chloride.

Grades: 99.99% pure (electrolytic process); single crystals.

Uses: Target material for x-rays; manufacture of alloy steels (see ferrovanadium); vanadium compounds, especially catalysts for sulfuric acid and synthetic rubber.

vanadium acetylacetonate.

Properties: Blue to blue-green crystals. Decomposes before melting.

Derivation: Reaction of vanadyl sulfate with acetylacetone and sodium carbonate.

Use: Catalyst.

vanadium carbide.

Properties: Crystals with hardness 2800 kg/sq mm; sp. gr. 5.77; m.p. 2800°C; b.p. 3900°C; resistivity 150 micro-ohm cm (room temp.).

Uses: Alloys for cutting tools; steel additive.

vanadium dichloride (vanadous chloride) VCl_2 .

Properties: Apple-green hexagonal plates. Soluble in alcohol and ether; decomposes in hot water. Sp. gr. 3.23 (18°C).

Derivation: From vanadium trichloride by heating in atmosphere of nitrogen.

Method of purification: Sublimation in nitrogen.

Grade: C.P.

Containers: Sealed glass bottles.

Hazard: Toxic. Strong irritant to tissue.

Uses: Strong reducing agent; purification of hydrogen chloride from arsenic.

vanadium disulfide V_2S_3 . Solid; sp. gr. 4.20; m.p. decomposes. Soluble in hot sulfuric or nitric acids; insoluble in alkalis. Used as a solid lubricant.

vanadium ethylate ($\text{C}_2\text{H}_5\text{O})_2\text{V}$.

Properties: Dark reddish-brown solid.

Derivation: Reaction of vanadium chloride with sodium ethylate.

Use: Polymerization catalyst.

vanadium hexacarbonyl $\text{V}(\text{CO})_6$.

Properties: Blue-green powder; sublimes easily at 50°C (15 mm); paramagnetic; decomposes without melting at 60–70°C.

Hazard: Toxic; strong irritant to tissue. Store under inert gas.

Use: Chemical intermediate; production of plating compounds and fuel additives.

vanadium hexacarbonyl, sodium salt. A convenient, though incomplete, name for the complex compound $\text{Na}(\text{C}_6\text{H}_{14}\text{O}_3)_2\text{V}(\text{CO})_6$, which has also been named bisdiglymesodium hexacarbonyl vanadate.

Properties: Yellow solid; m.p. 173–176°C (with decomposition); soluble in water, alcohol and ether; slightly soluble in hydrocarbons. Relatively inert to air, but is stored and shipped under nitrogen.

Hazard: Toxic; strong irritant to tissue.

Use: Source of vanadium hexacarbonyl by treatment with phosphoric acid under special conditions.

vanadium nitride VN .

Properties: Black solid; sp. gr. 6.13; m.p. 2320°C. Insoluble in water; slightly soluble in aqua regia.

Use: Refractory.

vanadium oxydichloride. See vanadyl chloride.

vanadium oxytrichloride VOCl_3 .

Properties: Lemon-yellow liquid; sp. gr. 1.811 (32°C); f.p. -78.9°C; b.p. 125–127°C; nonionizing solvent; dissolves most nonmetals; dissolves and/or reacts with many organic compounds. Hydrolyzes in moisture.

Hazard: Highly toxic; strong irritant to tissue.

Uses: Catalyst in olefin polymerization, (ethylene-propylene rubber); organovanadium synthesis.

Shipping regulations: (Rail) white label. (Air) Corrosive label. Not accepted on passenger planes.

vanadium pentoxide (vanadic acid anhydride) V_2O_5 .

Properties: Yellow to red crystalline powder; sp. gr. 3.357 (18°C); m.p. 690°C; b.p. decomposes at 1750°C. Soluble in acids and alkalis; slightly soluble in water.

Derivation: (a) Alkali or acid extraction from vanadium minerals. (b) By igniting ammonium metavanadate. (c) From concentrated ferrophosphorus slag by roasting with sodium chloride, leaching with water, and purification by solvent extraction followed by precipitation and heating.

Method of purification: Alkali solution, precipitation as ammonium metavanadate and ignition to V_2O_5 .

Grades: Commercial air-dried; commercial fused; C.P. air-dried; C.P. fused.

Containers: Drums; multiwall paper sacks.

Hazard: Toxic by inhalation. Tolerance (as V), (dust) 0.5 (fume) 0.1 mg per cubic meter of air.

Uses: Catalyst for oxidation of sulfur dioxide in sulfuric acid manufacture (see also contact process); ferrovanadium (q.v.); catalyst for many organic reactions; ceramic coloring material; vanadium salts; inhibiting ultraviolet transmission in glass; photographic developer; dyeing textiles.

vanadium sesquioxide. See vanadium trioxide.

vanadium sulfate. See vanadyl sulfate.

vanadium sulfide (vanadium pentasulfide; vanadic sulfide) V_2S_5 .

Properties: Black-green powder. Soluble in acids, alkali-metal sulfides and alkalis; insoluble in water.

Sp. gr. 3.0. Decomposes on heating.

Derivation: Action of hydrogen sulfide on vanadium chloride solution.

Hazard: May be toxic by inhalation (especially to animals).

Use: Vanadium compounds.

vanadium tetrachloride VCl_4 .

Properties: Red liquid. Soluble in absolute alcohol and ether; decomposes slowly to vanadium trichloride and chlorine below 63°C. Sp. gr. 1.816 (20°C); f.p. -28°C; b.p. 154°C. Nonflammable.

Derivation: Chlorination of ferrovandium.

Method of purification: Distillation and fractionation.

Hazard: Highly toxic by ingestion, inhalation and skin absorption. Open containers only in dry oxygen-free atmosphere or inert gas; wear goggles and protective clothing (MCA).

Uses: Preparation of vanadium trichloride, vanadium dichloride, and organovanadium compounds.

Shipping regulations: (Rail) white label. (Air) Corrosive label. Not acceptable on passenger planes.

vanadium tetraoxide V_2O_4 .

Properties: Blue-black powder; sp. gr. 4.339; m.p. 1967°C; insoluble in water; soluble in alkalis and acids.

Derivation: (1) From vanadium pentoxide by oxalic acid reduction. (2) From vanadium pentoxide by carbon reduction.

Hazard: May be toxic and irritant.

Use: Catalyst at high temperature.

vanadium trichloride VCl_3 .

Properties: Pink deliquescent crystals; soluble in absolute alcohol and ether. Decomposes in water. Sp. gr. 3.0 (18°C); decomposes on heating.

Derivation: From vanadium tetrachloride boiling under reflux condenser.

Hazard: Toxic and irritant.

Use: Preparation of vanadium dichloride and organovanadium compounds.

Shipping regulations: (Air) Poison label.

vanadium trioxide (vanadium sesquioxide) V_2O_3 .

Properties: Black crystals; soluble in alkalis and hydro-

fluoric acid; slightly soluble in water. Sp. gr. 4.87 (18°C); m.p. 1970°C.

Derivation: From vanadium pentoxide by either hydrogen or carbon reduction.

Hazard: May be toxic and irritant.

Use: Catalyst for conversion of ethylene to ethyl alcohol.

vanadous chloride. See vanadium dichloride.

vanadyl chloride (vanadium oxydichloride; vanadyl dichloride; divanadyl tetrachloride) $V_2O_2Cl_4 \cdot 5H_2O$.

Properties: Green, very deliquescent crystals. Slowly decomposed by water. Usual technical product is a dark green syrupy mass 76–82% pure, or a solution. Soluble in water, alcohol, and acetic acid.

Grade: Technical.

Hazard: Toxic and irritant.

Use: Mordanting textiles.

vanadyl sulfate (vanadic sulfate; vanadium sulfate)

$VOSO_4 \cdot 2H_2O$.

Properties: Blue crystals; soluble in water.

Derivation: Reduction of cold solution of concentrated sulfuric acid and vanadium pentoxide by sulfur dioxide gas.

Containers: Glass bottles; kegs.

Hazard: May be toxic and irritant.

Uses: Mordant; catalyst; aniline black preparation; reducing agent; colorant in glasses and ceramics.

"Vancide 89."⁶⁹ Trademark for N-(trichloromethyl-mercapto)-4-cyclohexene 1,2-dicarboximide. See captan.

Use: Fungicide for vinyl compositions.

"Vancide 26EC."⁶⁹ Trademark for lauryl pyridinium 5-chloro-2-benzothiazyl sulfide.

Use: Preservative for cotton fabrics used in rubber structures. Applied from an aqueous solution.

"Vancide 51Z."⁶⁹ Trademark for zinc dimethyldithiocarbamate $[(CH_3)_2NC(S)S]_2Zn$, with a small proportion of zinc 2-mercaptobenzothiazole.

Use: Fungicide for neoprene compositions; ultra-accelerator for rubber.

"Vancocin."¹⁰⁰ Trademark for vancomycin hydrochloride (q.v.).

vancomycin hydrochloride.

Properties: Tan to brown powder, odorless, with bitter taste. Soluble in water; moderately soluble in dilute methanol; insoluble in higher alcohols, acetone, ether.

Derivation: Produced by *Streptomyces orientalis* from Indonesian and Indian soil.

Grade: U.S.P.

Use: Medicine (antibiotic).

van der Waals' forces. Weak attractive forces acting between molecules. They are somewhat weaker than hydrogen bonds (q.v.) and far weaker than interatomic valences. They are involved in the van der Waals equation of state for gases which compensates for the actual volume of the molecules and the forces acting between them. "Information regarding the numerical values of van der Waals forces is mostly semiempirical, derived with the aid of theory from an analysis of chemical or physical data. Attempts to calculate the forces from first principles have had a measure of success only for the simplest systems, such as H—H, He—He and a few others. When judging the difficulties of such calculations, one must bear in mind that the

energies sought are of the same order of magnitude as the errors in the best atomic energy calculations." (Henry Margenau) See also hydrogen bond; chemical bonding.

"Vandex."⁶⁹ Trademark for a finely ground selenium.

Properties: Dark gray metallic powder; sp. gr. $4.80 \pm .03$; fineness through 200 mesh 99%; melting range above 217°C; slightly soluble in benzene; soluble in carbon disulfide; insoluble in water.

Uses: Rubber vulcanization.

Van Dyke brown (Cassel brown; Cologne brown; Cologne earth; ulmin brown). A naturally occurring pigment.

Derivation: Indefinite mixtures of iron oxide and organic matter. Obtained from bog-earth, peat deposits or from ochers containing bituminous matter.

Containers: Barrels or fiber drums.

Use: Pigment for artists' colors and stains.

Van Dyke red. A brownish red pigment consisting of copper ferrocyanide; sometimes used to refer to red varieties of ferric oxide. See iron oxide red.

Use: Pigment.

"Vanfre."⁶⁹ Trademark for a series of release agents for various plastics.

vanillin (3-methoxy-4-hydroxybenzaldehyde; vanillic aldehyde) $(CH_3O)(OH)C_6H_3CHO$. The methyl ether of protocatechuic aldehyde.

Properties: White crystalline needles; sweetish smell. Sp. gr. 1.056; m.p. 81–83°C; b.p. 285°C. Soluble in 125 parts water; in 20 parts glycerol and in 2 parts 95% alcohol; soluble in chloroform and ether. Combustible; low toxicity.

Derivation: (a) By extraction of the vanilla bean; (b) from lignin contained in sulfite waste pulp liquor.

Method of purification: Crystallization.

Grades: Technical; U.S.P.; F.C.C.

Containers: Cartons, bottles; cans; drums.

Uses: Perfumes; flavoring; pharmaceuticals; laboratory reagent; source of L-dopa.

"Vanplast 125."⁶⁹ Trademark for cresyl diphenyl phosphate; used as a flame-retardant plasticizer for vinyl formulations, including foam.

"Vanstay."⁶⁹ Trademark for a series of heat and light stabilizers for polyvinyl chloride resins.

"Vantoc" DD-50.³²⁵ Trademark for a blend of mineral oil with sulfonated oils and esters. Used as textile softener and shrink-proofing oil.

"Vapam."¹ Trademark for a soil fumigant composed of sodium N-methyldithiocarbamate dihydrate (q.v.).

"Vapona."¹²⁵ Trademark for an insecticide which contains not less than 93% 2,2-dichlorovinyl dimethyl phosphate (see DDVP) and not more than 7% active, related compounds.

Hazard: See dichlorovos.

vapor. An air dispersion of molecules of a substance that is liquid or solid in its normal state, i.e., at standard temperature and pressure. Examples are water vapor and benzene vapor. Vapors of organic liquids are also loosely called fumes. See also evaporation; gas.

vapor-phase chromatography. See gas chromatography.

vapor pressure. The pressure (usually expressed in millimeters of mercury) characteristic at any given temperature of a vapor in equilibrium with its liquid or solid form.

vapor tension. See vapor pressure.

"Vaportone."²⁵³ Trademark for a series of insecticides containing tetraethylpyrophosphate.
Hazard: See tepp.

"Variamine."³⁰⁷ Trademark for an azoic composition for printing blues on cotton and rayon.

"Varidase."³¹⁵ Trademark for streptokinase-streptodornase enzymes.

"Varkon."³⁰⁰ Trademark for sequestering agents of the ethylenediaminetetraacetate type. Used in kier boiling, peroxide bleaching, dyeing and stripping operations. Available as both powder and liquid.

varnish. (1) An organic protective coating, similar to a paint, except that it does not contain a colorant. It may be comprised of a vegetable oil (linseed, tung, etc.) and solvent, or of a synthetic or natural resin and solvent. In the first case the formation of the film is due to polymerization of the oil, and in the second to evaporation of the solvent. "Long-oil" varnishes such as spar varnish (q.v.) have a high proportion of drying oil; "short-oil" types have a lower proportion, i.e., furniture varnishes. Spirit varnishes contain such solvents as methanol, toluene, ketones, etc., and often also thinners such as naphtha or other light hydrocarbon. Flammable. (2) A hard, tightly adherent deposit on the metal surfaces of automobile engines resulting from resinous oxidation products of gasoline and lubricating oils.

varnish remover. See paint remover.

"Varnon."⁴⁴⁶ Trademark for hard-fired super-duty fireclay brick which resists the destructive action of carbon monoxide and other reducing gases. Used as glass tank regenerator checkers; also to line various metallurgical furnaces, rotary kilns, shaft kilns, carbon baking furnaces, and incinerators.

"Varox."⁶⁹ Trademark for a 50% active blend of 2,5-bis(tert-butylperoxy)-2,5-dimethylhexane with an inert mineral carrier.

Properties: White powder; sp. gr. $1.43 \pm .03$.

Uses: Cross-linking agent for polymers such as polyethylene.

"Varsol."⁵¹ Trademark for straight petroleum aliphatic solvents used as paint and varnish thinners, for dry cleaning and for general plant machinery cleaning. Conform to CS3-40, the U.S. Dep't of Commerce commercial standard for Stoddard Solvent and have minimum TCC flash points of 100°F. Combustible.

"Varsoy."²²¹ Trademark for a prebodied chemically modified soybean oil for varnish cooking or bodied drying oil.

"Vaseline" Petroleum Jelly.⁹⁷ Trademark for a commercial product of petroleum, largely employed in pharmacy, alone and as a vehicle for external applications of medicinal agents, especially when local action rather than absorption is desired; as a protective coating for metallic surfaces, and for other purposes. Consists of a semisolid mixture of hydrocarbons, having a m.p. usually ranging between 38° and 60°C. Colorless or pale yellow, translucent, semisolid unctuous mass. Does not readily oxidize on exposure to the air and is not readily acted on by chemical

reagents. Soluble in chloroform, benzene, carbon disulfide, oil of turpentine, warm ether; slightly soluble in hot alcohol, but separates from the latter in flakes on cooling.

vasopressin (beta-hypophamine; antidiuretic hormone). One of the hormones secreted by the posterior lobe of the pituitary gland. It causes an increase in blood pressure and an increase in water retention by the kidney. Vasopressin is an octapeptide consisting of eight different amino acids.

Derivation: Synthetic, or from the posterior lobe of the pituitary of food animals.

Grade: U.S.P., as an aqueous solution for injection.

Use: Medicine.

vat dye. A class of dyes that can be easily reduced, i.e., vatted, to a soluble and usually colorless leuco form in which they can readily impregnate fibers. Subsequent oxidation then produces the insoluble colored dyestuff in a form that is remarkably fast to washing, light and chemicals. Examples are indigo (CI No. 73000), and Indanthrene Blue BFP (CI No. 69825). The reducing agents are usually an alkaline solution of sodium hydrosulfite ($\text{Na}_2\text{S}_2\text{O}_4$) or some derivative of the latter. Oxidation is by air, perborate, dichromate, etc.

vat printing assistant. A mixture of gums, reducing and wetting agents used to carry the dye in printing fabrics with vat dyes. They assist in securing penetration of the fabric and in converting the dyes from a semi-leuco to a leuco state.

"Vatrolite."¹⁵⁹ Trademark for a group of concentrated sodium hydrosulfite preparations.

Uses: Bleaching textiles and paper; oxygen scavenger in synthetic rubber production.

"Vatsol."⁵⁷ Trademark for a series of wetting agents made in several different grades and types: OS, sodium isopropyl naphthalene sulfonic acid; OT, sodium dioctyl sulfosuccinate.

"Vazo."²⁸ Trademark for azobisisobutyronitrile.

"V-Bor."⁵⁸ Trademark for refined borax pentahydrate $\text{Na}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$; 99.8% purity. Obtained from Searles Lake brines.

VC. Abbreviation for vinyl chloride or vinylidene chloride.

"V-C 13 Nemacide."⁴⁰ Trademark for a 75% emulsifiable concentrate whose active ingredient is O-2,4-dichlorophenyl-O,O-diethylphosphorothioate.

Hazard: Highly toxic.

Uses: Insecticide and nematocide.

vector. In biochemistry, an organism that carries or transports an infectious disease.

"Vectra."²⁹ Trademark for a polypropylene fiber.

"Vegadex" Herbicide.⁵⁸ Trademark for a herbicide containing 2-chloroallyl diethyldithiocarbamate as the active ingredient.

Hazard: May be toxic.

vegetable black. In general any form of more or less pure carbon produced by incomplete combustion or destructive distillation of vegetable matter, wood, vines, wine lees.

vegetable dye. A colorant derived from a vegetable source, i.e., logwood, indigo, madder, etc.

vegetable gum. See dextrin.

vegetable ivory. A mannose polysaccharide obtained from the hardened seeds of the ivory-nut (Corozonut) tree (*Phytelephas macrocarpa*). The latter must be distinguished from the cohune palm (*Attalea cohune*) whose seeds are also sometimes referred to as corozo nuts.

Uses: Button manufacture; mannose production.

vegetable oil. An oil extracted from the seeds, fruit or nuts of plants and generally considered to be mixtures of mixed glycerides (e.g., cottonseed, linseed, corn, coconut, babassu, olive, tung, peanut, perilla, oiticica, etc.). Many types are edible.

Containers: Bottles; drums; tank cars; tank trucks.

Uses: Paints (as drying oils); shortenings; salad dressings; margarine; soaps; rubber softeners; medicine; dietary supplements; pesticide carriers.

See also specific entry.

vegetable tanning. The tanning of leather by plant extracts. See tannic acid; tanning; wattle bark; quebracho.

vehicle. A term used in paint technology to indicate the liquid portion of a paint, comprised of drying oil or resin, solvent, and thinner, in which the solid components are dissolved or dispersed. See also paint.

"Velban."¹⁰⁰ Trademark for vinblastine sulfate.

"Velsicol" 2-1.³¹⁶ Trademark for a mercuric turf fungicide.

Hazard: See mercury compounds.

"Velsicol" Emmi.³¹⁶ Trademark for a mercuric fungicide.

Hazard: See mercury compounds.

"Velvetex."¹³³ Trademark for carbon black in the high structure, coarse particle size range; gives improved processing and physical properties of various elastomers.

Venetian red. A high-grade ferric oxide pigment of a pure red hue. It is obtained either native as a variety of hematite red (q.v.) or more often artificially, by calcining coppers (ferrous sulfate) in the presence of lime. The composition ranges from 15 to 40% ferric oxide and from 60 to 80% calcium sulfate. The 40% ferric oxide is the "pure" grade and has a sp. gr. of 3.45.

Grades: 20 to 40% ferric oxide.

See also iron oxide red.

"Veon."²³³ Trademark for herbicides consisting of amine salts of 2,4-D and 2,4,5-T.

Hazard: See 2,4-D and 2,4,5-T.

"Vera Blanc."¹⁴⁸ Trademark for a filler or extender composed of calcium carbonate, whiting, finely ground limestone, primer. Water-ground, water-floated and silk-bolted. Sp. gr. 2.72; wt. per solid gal. 22.66 lbs.

Chemical and screen analysis: Calcium carbonate 99.5%; 100% 325 mesh; average particle size 4 microns.

Uses: Oil and water paints, colors, rubber compounds, adhesives, oilcloth, linoleum, textile fabrics, fur dressing, putty, plastics, ceramics, etc.

"Verabore."³⁴² Trademark for extract of antihypertensive alkaloids from *Veratrum* species.

"Verasfleurs."¹⁵⁸ Trademark for a series of synthetic replacements for natural floral absolutes.

veratrole (1,2-dimethoxybenzene; pyrocatechol dimethyl ether) $C_6H_4(OCH_3)_2$.

Properties: Colorless crystals or liquid; m.p. 21–22°C; b.p. 206–207°C; sp. gr. 1.084 (25/25°C). Soluble in alcohol and ether; slightly soluble in water.

Derivation: Treatment of catechol in methyl alcohol with dimethyl sulfate and caustic.

Use: Medicine (antiseptic).

veratrum alkaloid. One of a group of alkaloids used in medicine to relieve hypertension. They include veratrum viride (American hellebore).

Hazard: May have severely toxic side effects. See also alkaloid.

"Verel."²⁵⁶ Trademark for a modified acrylic fiber.

"Verelite."²³³ See "Styron."

verdigris. See copper acetate, basic.

vermiculite. Hydrated magnesium-iron-aluminum silicate capable of expanding six to twenty times when heated to about 2000°F. The platelets exhibit an active curling movement when heated; hence the name. Occurrence: Montana, North Carolina, South Carolina, Wyoming, Colorado; South Africa.

Properties: Platelet-type crystalline structure; high porosity; high void volume to surface area ratio; low density; large range of particle size; insoluble in water and organic solvents; soluble in hot concentrated sulfuric acid; water vapor adsorption capacity of expanded vermiculite less than 1%; liquid adsorption dependent on conditions and particle size, ranges 200–500%. Noncombustible; nontoxic.

Grades: Unexpanded (ore concentrate); expanded (also called exfoliated); flake; activated.

Containers: Multiwall paper bags, 4 cu ft.

Uses: Lightweight concrete aggregate; insulation; sound conditioning; fireproofing; plaster; soil conditioner; additive for fertilizers; seed bed for plants; refractory; lubricant; oil well drilling mud; filler in rubber, paint, plastics; wall paper printing; removal of strontium-90 from milk; absorption of oil spills on seawater; animal feed additive; packing; carrier for insecticides; catalyst and catalyst support; litter for hatcheries; adsorbent.

See also verxite.

vermilion, natural. See cinnabar.

vernolepin. A sesquiterpene dilactone extracted from leaves of an African plant *Veronia hymenolepis*.

Uses: Biochemical research (inhibits tumor growth in rats and reversibly retards plant growth).

"Veronal."¹⁶² Trademark for barbiturate.

"Versadyme."²⁵⁹ Trademark for dimerized vegetable fatty acids.

Uses: Production of polymers, petroleum additives, corrosion inhibitors, paint additives and surfactants.

"Versalide."²²⁷ Trademark for 1,1,4,4-tetramethyl-6-ethyl-7-acetyl-1,2,3,4-tetrahydronaphthalene, a polycyclic musk.

"Versalon."²⁵⁹ Trademark for thermoplastic polyamide resins of high strength, good adhesion and flexibility.

Uses: Hot-melt adhesives, heat-seal coatings, electrical encapsulation.

"Versamid."²⁵⁹ Trademark for thermoplastic and reactive polyamide resins. The reactive resins copolymerize with epoxy resins.

Uses: Heat-seal coatings; hot-melt adhesives; varnishes, paints, and inks; coatings; structural adhesives.

"Versatic" 911 Acid.¹²⁵ Trademark for a saturated synthetic tertiary monocarboxylic acid having C₉, C₁₀ and C₁₁ chain length.

Derivation: From olefins, water and carbon monoxide in the presence of a strong acid catalyst.

Uses: Chemical intermediate to make extremely stable esters, metal salts, nitrogen derivatives, and hindered alcohols.

"Versatyl."¹⁴¹ Trademark for a series of printing ink vehicles and pigment colors flushed in the vehicles.

Flushed Colors: Wide range of yellows, reds, blues and greens.

Uses: Letterpress, lithographic, offset, tin lithography; quick-set, gloss, multicolor and snap-dry inks.

"Versenate."²³³ Trademark for disodium salt of ethylenediaminetetraacetic acid and related compounds.

"Versene."²³³ Trademark for a series of chelating agents based on ethylenediaminetetraacetic acid (q.v.).

"Versene Fe-3 Specific."²³³ Trademark for an iron specially chelating agent. Active ingredient is sodium dihydroxyethylglycine. Available as straw-colored liquid or white powder.

"Versenex" 80.²³³ Trademark for pentasodium salt of diethylenetriaminepentaacetic acid.

"Versenol" 120.²³³ Trademark for the trisodium salt of N-hydroxyethylethylenediaminetriacetic acid, (C₁₀H₁₅O₇N₃Na₃). Used as an organic chelating agent.

"Versilad."²⁴⁴ Trademark for a silicate-based adhesive designed specifically for the corrugated cardboard industry.

"Versilate."²⁴⁴ Trademark for a composition of fortified sodium silicate.

Properties: Viscous liquid; opalescent.

Containers: Tank trucks and tank cars.

Use: Base for "Versilad" adhesives.

"Versilube."²⁴⁵ Trademark for a series of silicone hydraulic fluids, lubricating fluids and greases.

"Vertifume."²³³ Trademark for fumigants containing carbon tetrachloride and carbon disulfide.

verxite (exfoliated hydrobiotite).

Properties: Thermally expanded (exfoliated) magnesium-iron-aluminum silicate having a minimum of 98% purity and a bulk density of 5 to 7 lb per cubic foot. Expansion occurs by heating at about 1400°F. Sponge-like structure which absorbs liquids and permits reexpansion after compression to 70-80% of the original heat-expanded volume.

Uses: Poultry feed in quantities not greater than 5% as a non-nutritive bulking agent; pelleting or anticaking agent and nutrient carrier in dog and ruminant feeds. For dog feeds the maximum permitted is 1.5%. Labeling must state content when in excess of 1%. See also vermiculite.

"Vespeil."²²⁸ Trademark for fabricated parts, based on polyimide resin, and diamond abrasive wheels formulated with a high-temperature polyimide binder.

"Vesprin."⁴¹² Trademark for trifluoromazine hydrochloride (q.v.).

"Vetalog."⁴¹² Trademark for triamcinolone acetonide; used in veterinary medicine.

"Vetame."⁴¹² Trademark for trifluoromazine hydrochloride.

vetiver oil (cuscus oil; vetivert).

Properties: Viscid essential oil; violet-like odor; sp. gr. 0.990-1.040 (15°C); optical rotation +15 to -45°; refractive index (n_D 20/D) 1.5200-1.5280; saponification value 14-45; soluble in 1-3 volumes of 80% alcohol, in fixed oils; insoluble in glycerin and propylene glycol. Combustible; nontoxic.

Derivation: Steam distillation of partially dried roots of East Indian grass, *Vetiveria zizanioides*. Purified by rectification.

Grades: Characterized by its geographical origin (Java, Haiti, East Indian, Bourbon Reunion, French).

Containers: Bottles; cans.

Use: Perfumery.

"Vestrep."¹²³ Trademark for a veterinary preparation containing streptomycin sulfate.

"Vexar."²⁸ Trademark for both low and high density polyethylene and polypropylene plastic netting. Available in wide variety of forms and colors for use in packaging.

"V-G-B."²⁴⁸ Trademark for reaction product of acetaldehyde and aniline.

Properties: Brown resinous powder; sp. gr. 1.152; m.p. 60-80°C; soluble in acetone, benzene, and ethylene dichloride; insoluble in water and gasoline.

Use: Rubber antioxidant.

"Vialon."⁴⁴⁰ Trademark for a series of dyes for nylon fibers and furs.

"Vibrathane."²⁴⁸ Trademark for a group of polyurethane raw materials for manufacture of foam and elastomers. Includes isocyanates, polyesters, polyether glycols, polyester and polyether prepolymer, liquid casting resins and gums and catalysts.

"Vibrin."²⁴⁸ Trademark for resin compositions of polyesters and cross-linking monomers which, when catalyzed, will polymerize to infusible solid resins without evolving water or other by-products.

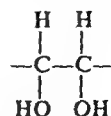

Uses: Molding; laminating; impregnating; casting; automotive and aircraft structural parts; wall panels, table tops; coating for paper; boat hulls; chemically inert tanks; large-diameter pipe.

vic-. Prefix meaning vicinal (q.v.).

"Vicalloy."¹⁵⁵ Trademark for a magnetic alloy composed of iron, 38%; cobalt, 52%, and vanadium, 10%. Properties: Density, 8.09 g/cm³; tensile strength, 100,000 psi.

Uses: Magnetic recording tape; machinable permanent magnets.

vicinal (abbreviated as vic-). Neighboring or adjoining positions on a carbon ring or chain; the term is used in naming derivatives with substituting groups in such locations in a structural formula or molecule. For example, vicinal locations in the molecule shown are occupied by the hydrogen atoms and the hydroxyl groups:

"Victacid 105."¹ Trademark for a high-strength technical grade of phosphoric acid composed of approxi-

mately equal quantities of orthophosphoric and polyphosphoric acids.

Uses: Dehydrating agent for organic reactions; sequestrant for heavy metals and control of P_2O_5 content of bath process for electropolishing and bright-dipping metals.

"Victamide."¹ Trademark for exceedingly fine particles of ammonium salt of an amido polyphosphate, practically all less than five microns. Slowly soluble in cold water; more rapidly in hot water.

Uses: Sequestering agent for metallic ions; flame-proofing agent; deflocculating agent for oil-drilling muds, paint pigments, and clay slips.

"Victamines."¹ Trademark for tan, waxy solids; cationic surface-active phosphorus compounds which disperse in water.

Uses: Wetting and softening agents for textiles and leather; oil additives.

"Victamuls."¹ Trademark for nonionic, surface-active phosphorus compounds.

Uses: Emulsifying, penetrating, solubilizing, or dispersing agents.

"Victawets."¹ Trademark for surface-active phosphorus compounds. Anionic and nonionic wetting agents, used as penetrants, dye carriers, and dispersing agents.

"Victor Cream."¹ Trademark for sodium acid pyrophosphate. Purity meets all requirements of federal and state pure food laws; F.C.C. grade.

Uses: Baking acid in doughnut and prepared flours; manufacture of commercial baking powders and instant puddings; for conditioning oil-well drilling muds; formulation of acid-type metal cleaners.

Victoria blue $C_{33}H_{31}N_3 \cdot HCl$. CI No. 44045.

Properties: Crystalline powder, bronze colored. Soluble in hot water, alcohol or ether.

Derivation: Michler's ketone is condensed with phenyl-alpha-naphthylamine.

Uses: Dyeing silk, wool, and cotton; biological stain; dye intermediate for complex acid pigment toners.

Victoria green. See malachite green.

vicuna. A soft wool-like fiber obtained from a South American animal similar to the llama. Used for specialty high-grade coats, sweaters, etc. Combustible.

"Vidden D."²³³ Trademark for 1,3-dichloropropene and 1,2-dichloropropane mixture.

"Vigofac 6."²⁹⁹ Trademark for an unidentified growth factor for addition to animal feeds. Derived from dried streptomyces fermentation solubles.

"Vikane."²³³ Trademark for sulfuryl fluoride (q.v.).

"Vim-Thane."³²⁰ Trademark for polyurethane-impregnated leather packings.

"Vinac."¹⁴⁴ Trademark for polyvinyl acetate emulsions, powders, beads and solutions.

Emulsions: Properties (range): 48% to 57% solids; 80 to 4200 cp; 4.0 to 7.0 pH; 0.15 μ to 2.5 μ average particle size; nonionic.

Uses: Binder in pigmented paper coatings; adhesive bases; concrete adhesive; textile finishes.

Powders: Properties: White, free-flowing powder; 33 lbs per cu ft bulk density; 98% through 100 mesh;

viscosity of 5000 to 7000 cp in 50% dispersion; particle size of 2 μ to 6 μ in dispersion.

Use: Adhesive for concrete and joint cements.

Beads: Properties (range): Glass-like spheres; low, medium, and high molecular weight grades; soluble in organic solvents except aliphatic hydrocarbons; ASB-grade is soluble in alkalies in addition to organic solvents.

Uses: Hot melt and solvent adhesives; solvent paints; specialty paper coatings; binders in inks.

Solutions: Properties: Methanol solvent; 50% to 51% polymer; 900-1100 cp.

Hazard: Toxic and flammable.

Use: Heat-seal adhesives.

"Vinactane" Sulfate.³⁰⁵ Trademark for viomycin sulfate.

vinal fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 50% by weight of vinyl alcohol units, $-CH_2CHOH-$, and in which the total of the vinyl alcohol units and any one or more of the various acetal units is at least 85% by weight of the fiber (Federal Trade Commission). It has good chemical resistance, low affinity for water; good resistance to mildew and fungi. Combustible.

Uses: Fishing nets; stockings, gloves; hats; rainwear; swimsuits.

"Vincel."³³² Trademark for a group of fabrics of polyvinyl chloride fibers for liquid and pneumatic filtration.

"Vin-Clad."³²⁶ Trademark for a series of dry, free-flowing polyvinyl chloride powders formulated for application by the fluidized bed process to provide protective and decorative coatings.

vinegar.

Properties: Brownish or colorless liquid; dilute aqueous solution containing from 4 to 8% acetic acid (q.v.), depending on source. Legal minimum is 4%. Also contains low percentages of alcohols and mineral salts. Nontoxic; nonflammable.

Derivation: (a) Bacterial fermentation of apple cider, wine or other fruit juice. (b) Fermentation of malt or barley. The fermenting agent is usually a mold (e.g., *Mycoderma aceti*), generally known as "mother" (q.v.). Either type can be distilled to remove color and other impurities, and is then called white vinegar.

Containers: Bottles; carboys.

Uses: Mayonnaise; salad dressings; pickled foods; preservative; medicine (antifungal agent); latex coagulant.

"Vinethene."¹²³ Trademark for an anesthetic preparation consisting of vinyl ether.

"Vinoflex."⁴⁴⁰ Trademark for vinyl chloride homo- and copolymers.

"Vinol."¹⁴⁴ Trademark for polyvinyl alcohol (q.v.).

Properties: White, free-flowing powders; water-soluble; films are impervious to oxygen and other gases; films resist greases and solvents and range from water-soluble to water resistant, depending on grade.

Uses: Adhesives; finishing and sizing of textiles; protective coatings; films; paper coating; protective colloid in emulsion polymerization; molded and foamed products.

"Vinrez."⁵⁵³ Trademark for vinyl acetate polymer and copolymer emulsions.

"Vinsol."²⁶⁶ Trademark for a series of low-cost, dark, brittle, thermoplastic resins, ruby red by transmitted light, dark brown by reflected light. Available in solid form, flakes, fine powder, and aqueous dispersion.

Uses: Adhesives; emulsions; electrical insulation; inks; platics.

"Vinycol."²²³ Trademark for pigments of titanium dioxide ("Vinycol" No. 100) or high-color carbon black ("Vinycol" No. 200) dispersed in vinyl resins and plasticizers. Used in high-gloss vinyl finishes.

vinyl. See vinyl compound.

"Vinylac."⁶⁵ Trademark for a series of resinous tackifier dispersions for modification of polyvinyl acetate adhesive systems.

vinyl acetate $\text{CH}_3\text{COOCH}:\text{CH}_2$. Raw material for polyvinyl resins (q.v.). See also polyvinyl acetal resins; polyvinyl acetate; polyvinyl alcohol.

Properties: Colorless liquid, stabilized with either hydroquinone or diphenylamine inhibitors. The HQ-stabilized material can be polymerized without redistillation. The DPA-stabilized material must be distilled prior to polymerization. Sp. gr. 0.9345 (20/20°C; f.p. -100.2°C; b.p. 73°C; refractive index 1.3941; wt/gal 7.79 lb; flash point 30°F (TOC). Soluble in most organic solvents including chlorinated solvents; insoluble in water. Autoignition temp. 800°F.

Derivation: (a) Vapor-phase reaction of ethylene and acetic acid, with a palladium catalyst. (b) Vapor-phase reaction of acetylene and acetic acid, with zinc acetate catalyst.

Grade: Technical.

Containers: 1-, 5-gal cans; 55-gal steel drums; tank cars.

Hazard: Flammable, dangerous fire risk. Flammable limits in air 2.6 to 13.4%. Toxic by inhalation and ingestion. Tolerance, 10 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Polyvinyl acetate, polyvinyl alcohol, polyvinyl butyral, and polyvinyl chloride-acetate resins (q.v.). These are used particularly in latex paints; paper coating; adhesives; textile finishing; safety glass interlayers.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

vinyl acetate-ethylene copolymer. See "Aquace."

vinylacetonitrile. See allyl cyanide.

vinylacetylene C_2H_4 or $\text{H}_2\text{C}:\text{CHC}:\text{CH}$. The dimer of acetylene, formed by passing it into a solution of cuprous and ammonium chlorides in hydrochloric acid. Properties: Colorless gas or liquid; sp. gr. 0.6867 (0/20°C); b.p. 5°C. Combustible.

Use: Intermediate in manufacture of neoprene and for various organic syntheses.

See also divinyl acetylene.

vinyl alcohol (ethenol) $\text{CH}_2:\text{CHOH}$. Unstable liquid. Isolated only in form of its esters, or the polymer, polyvinyl alcohol (q.v.).

vinylation. The formation of a vinyl derivative by reaction with acetylene. Thus vinylation of alcohols yields vinyl ethers such as vinyl ethyl ether, $\text{C}_2\text{H}_5\text{OC}:\text{H}_2$. See also Reppe processes.

vinylbenzene. See styrene.

vinyl bromide. CH_2CHBr .

Properties: Gas; f.p. -138°C; b.p. 15.6°C; sp. gr. 1.51.

Hazard: Moderately toxic. Tolerance, 250 ppm in air.

Uses: Flame-retarding agent for acrylic fibers.

vinyl n-butyl ether (n-butyl vinyl ether; BVE)

$\text{CH}_2:\text{CHOC}_4\text{H}_9$.

Properties: Liquid; sp. gr. 0.7803 (20°C); b.p. 94.1°C; f.p. -113°C; refractive index 1.3997; flash point 15°F (open cup); wt/gal 7.45 lb (20°C). Slightly soluble in water; soluble in alcohol and ether.

Derivation: Reaction of acetylene with n-butyl alcohol.

Grade: Technical (98%).

Containers: Glass bottles; drums; tank cars.

Hazard: Flammable, dangerous fire risk.

Uses: Synthesis; copolymerization.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

vinyl butyrate $\text{CH}_2:\text{CHOOCC}_4\text{H}_9$.

Properties: Liquid; sp. gr. 0.9022 (20/20°C); b.p. 116.7°C; f.p. -86.8°C. Very slightly soluble in water. Flash point 68°F (open cup). Low toxicity.

Containers: 55-gal drums.

Hazard: Flammable, dangerous fire risk.

Uses: Polymers; emulsion paints.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

N-vinylcarbazole $\text{C}_{12}\text{H}_8\text{NHC}:\text{CH}_2$.

Properties: Liquid. Combustible; low toxicity.

Derivation: From acetylene and carbazole.

Use: Polymerizes to form heat-resistant and insulating resins somewhat similar to mica in dielectric properties. See polyvinyl carbazole.

vinyl cetyl ether. See cetyl vinyl ether.

vinyl chloride (VC; chloroethene; chloroethylene)

$\text{CH}_2:\text{CHCl}$. The most important vinyl monomer.

Properties: Compressed gas; easily liquefied; ethereal odor. Usually handled as liquid; phenol is added as a polymerization inhibitor. Sp. gr. 0.9121 (liquid, at 20/20°C); b.p. -13.9°C; f.p. -159.7°C; vapor pressure 2300 mm (20°C); flash point -108°F. Autoignition temp. 882°F. Slightly soluble in water; soluble in alcohol and ether.

Derivation: (a) Oxychlorination of ethylene; (b) reaction of acetylene and hydrochloric acid, either as liquids or gases; (c) pyrolysis of ethylene dichloride (see Wulff process). Method of purification: Distillation.

Grades: Technical; pure, 99.9%.

Containers: Cylinders; tank cars; ocean tankers.

Hazard: Highly flammable; severe explosion risk at 30,000 ppm. Probably carcinogenic. Tolerance for workroom exposure established by OSHA is 1 ppm (average over an 8-hr period); Exposure times up to 15 minutes are permissible up to 5 ppm. Respirators must be used in cases where this concentration is exceeded. Use in aerosol sprays prohibited. Safety Data Sheet available from Manufacturing Chemists Assoc., Washington, D.C.

Uses: Polyvinyl chloride and copolymers; organic synthesis; adhesives for plastics.

Shipping regulations: (Rail) Red Gas label. (Air) (inhibited) Flammable Gas label. Not acceptable on passenger planes; (uninhibited) Not acceptable.

vinyl 2-chloroethyl ether $\text{CH}_2:\text{CHOC}_2\text{H}_4\text{Cl}$.

Properties: Liquid; sp. gr. 1.0498 (20°C); b.p. 109.1°C; f.p. -69.7°C; very slightly soluble in water; flash point (open cup) 80°F.

Hazard: Flammable, dangerous fire risk.

Use: Polymerization monomer.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

vinyl compound. A compound having the vinyl grouping ($\text{CH}_2=\text{CH}-$), specifically vinyl chloride, vinyl acetate and similar esters, but also referring more generally to compounds such as styrene $\text{C}_6\text{H}_5\text{CH}=\text{CH}_2$, methyl methacrylate $\text{CH}_2=\text{C}(\text{CH}_3)\text{COOCH}_3$ and acrylonitrile $\text{CH}_2=\text{CHCN}$. The vinyl compounds are highly reactive, polymerize easily, and are the basis of a number of important plastics.

vinyl cyanide. See acrylonitrile.

vinylcyclohexene (1-vinylcyclohexene-3; 4-vinylcyclohexene-1; cyclohexenylethylene)

$\text{CH}_2=\text{CHCH}(\text{CH}_2\text{CH}=\text{CHCH}_2)_2$. A butadiene dimer.

Properties: Liquid; sp. gr. 0.8303 (20/4°C); f.p. -108.9°C; b.p. 128°C; refractive index 1.464 (n 20/D); flash point 70°F (TOC). Autoignition temp. 517°F. Temperatures above 80°F and prolonged exposure to oxygen-containing gases should be avoided as these conditions lead to discoloration and gum formation.

Grades: Technical, 95%; pure, 99%; research.

Containers: 1-, 5-gal cans; 55-gal drums; tank trucks; tank cars.

Hazard: Flammable, dangerous fire risk. May be narcotic in high concentrations.

Uses: Polymers; organic synthesis.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

vinylcyclohexene dioxide $\text{CH}_2\text{CHOC}_6\text{H}_9\text{O}$. Also called vinylcyclohexane dioxide.

Properties: Colorless liquid; sp. gr. 1.098 (20/20°C); b.p. 227°C; refractive index 1.4782 (n 20/D); viscosity 7.77 cp (20°C); flash point 230°F. Combustible.

Hazard: Strong irritant to skin and tissue. Moderately toxic by ingestion and skin absorption.

Uses: Polymers; organic synthesis.

vinylcyclohexene monoxide $\text{CH}_2=\text{CHC}_6\text{H}_9\text{O}$. Also called vinylcyclohexane monoxide.

Properties: Liquid; sp. gr. 0.9598 (20/20°C); b.p. 169°C; f.p. -100°C; flash point 136°F; viscosity 1.69 cp (20°C). Very slightly soluble in water. Combustible.

Hazard: Moderately toxic and irritant. Moderate fire risk.

Uses: Polymers; organic synthesis.

vinyl ether (divinyl ether; divinyl oxide)

$\text{CH}_2=\text{CHOCH}=\text{CH}_2$.

Properties: Colorless liquid with characteristic odor; sp. gr. 0.769; b.p. 39°C; refractive index (20/D) 1.3989. Slightly soluble in water; miscible with alcohol, acetone, chloroform, and ether. Must be protected from light. Flash point below -22°F; autoignition temp. 680°F.

Derivation: Treatment of dichloroethyl ether with alkali.

Grade: N.F. (contains 96-97% vinyl ether, remainder dehydrated alcohol).

Containers: 50- and 75-cc bottles.

Hazard: Highly flammable; severe fire and explosion risk. Explosive limits in air 1.7 to 27%. Highly toxic by inhalation; overexposure may be fatal.

Uses: Copolymer with 3 to 5% polyvinyl chloride for

plastic products such as clear plastic bottles; medicine (anesthetic, for brief operations only).

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label. Legal label name (Air), divinyl ether.

vinyl beta-ethoxyethyl sulfide

$\text{CH}_2=\text{CHSCH}_2\text{CH}_2\text{OC}_2\text{H}_5$.

Properties: Colorless liquid. Pungent, camphor-like odor. Sp. gr. 0.9532 (15°C); b.p. 65°C (8 mm).

Use: Organic synthesis.

vinylethylene. See butadiene.

vinyl ethyl ether (ethyl vinyl ether; EVE)

$\text{CH}_2=\text{CHOC}_2\text{H}_5$.

Properties: Colorless liquid. Extremely reactive; can be polymerized in liquid or vapor phase; slightly soluble in water: 0.9% by wt; sp. gr. 0.754 (20/20°C); 6.28 lb/gal (20°C); b.p. 35.5°C; vapor pressure 428 mm (20°C); f.p. -115.0°C; viscosity 0.22° cp (20.0°C); refractive index 1.3739; flash point -50°F. Autoignition temp. 395°F. Commercial material contains inhibitor to prevent premature polymerization. Often stored underground to minimize vapor losses.

Derivation: Reaction of acetylene with ethyl alcohol.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Highly flammable; severe fire and explosion risk. Explosive limits in air 1.7 to 28%.

Uses: Copolymerization; intermediate.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) (Inhibited) Flammable Liquid label. (Uninhibited) Not acceptable.

vinyl 2-ethylhexoate $\text{CH}_2=\text{CHOOCC}(\text{C}_2\text{H}_5)_4\text{H}_9$.

Properties: Liquid; sp. gr. 0.8751 (20/20°C); b.p. 185.2°C; f.p. -90°C; flash point 165°F (O.C.). Insoluble in water. Combustible.

Containers: 55-gal drums.

Uses: Polymers; emulsion paints.

vinyl 2-ethylhexyl ether $\text{CH}_2=\text{CHOCCH}_2\text{CH}(\text{C}_2\text{H}_5)_4\text{H}_9$.

Properties: Liquid; sp. gr. 0.8102 (20/20°C); b.p. 177.7°C; f.p. -100°C; flash point 135°F (open cup). Autoignition temp. 395°F. Insoluble in water. Combustible.

Containers: 55-gal drums.

Hazard: Moderate fire and explosion risk.

Uses: Intermediate for pharmaceuticals, insecticides, adhesives; viscosity index improver.

2-vinyl-5-ethylpyridine $(\text{CH}_2=\text{CH})\text{C}_5\text{H}_4\text{N}(\text{C}_2\text{H}_5)$.

Properties: Liquid. Sp. gr. (20/20°C) 0.9449; b.p. (100 mm) 138°C; vapor pressure (20°C) 0.2 mm; f.p. -50.9°C; insoluble in water; flash point 200°F (COC). Combustible.

Hazard: Probably toxic.

Uses: Copolymer; synthesis.

vinyl fluoride (fluoroethylene) $\text{CH}_2=\text{CHF}$.

Properties: Colorless gas; b.p. -72°C; insoluble in water; soluble in alcohol and ether.

Containers: Cylinders.

Hazard: Flammable, dangerous fire and explosion risk. Probably toxic by inhalation. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Monomer. See polyvinyl fluoride.

Shipping regulations: (Inhibited) (Rail) Red gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. (Uninhibited) Not acceptable.

vinylidene chloride (VC) $\text{CH}_2\text{:CCl}_2$.

Properties: Colorless liquid; f.p. -122.53°C ; b.p. 37°C ; flash point 14°F (open cup); Insoluble in water. Autoignition point 856°F . Readily polymerizes; commercially contains small proportion of inhibitor.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 5.6 to 11.4%.

Uses: Copolymerized with vinyl chloride or acrylonitrile to form various kinds of saran. Other copolymers are also made. Adhesives; component of synthetic fibers. See also saran.

Shipping regulations: (Inhibited) (Rail) Red label. (Air) Flammable Liquid label. Uninhibited Not acceptable.

vinylidene fluoride (1,1-difluoroethylene) $\text{H}_2\text{C:CF}_2$. A monomer.

Properties: Colorless gas with faint ethereal odor; b.p. -83°C (1 atm); f.p. -144°C (1 atm); density (liquid) 0.617 g/cc (24°C). Slightly soluble in water; soluble in alcohol and ether.

Derivation: Interaction of hydrogen with dichlorodifluoroethane.

Grade: 99% min purity.

Containers: Steel cylinders.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation. Explosive limits in air 5.5 to 21%. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Polymers and copolymers; chemical intermediate. See polyvinylidene fluoride.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. Legal label name (Air) difluoroethylene.

vinylidene resin (polyvinylidene resin). A polymer in which the unit structure is $(-\text{H}_2\text{CCX}_2-)$, in which X is usually chlorine, fluorine, or cyanide radical. Examples are saran and "Viton" A.

vinyl isobutyl ether (isobutyl vinyl ether; IVE) $\text{CH}_2\text{:CHOCH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid; sp. gr. 0.7706 ($20/20^\circ\text{C}$); b.p. 83.3°C ; vapor pressure 68 mm (20°C); f.p. -132°C ; refractive index 1.3938; flash point 15°F (open cup). Very slightly soluble in water; soluble in alcohol and ether; easily polymerized.

Derivation: Catalytic union of acetylene and isobutyl alcohol.

Method of purification: Washing with water, drying in presence of alkali, and distillation from metallic sodium.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire risk.

Uses: Polymer and copolymers used in surgical adhesives, coatings and lacquers; modifier for alkyd and polystyrene resins; plasticizer for nitrocellulose and other plastics; chemical intermediate.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) (Inhibited) Flammable Liquid label. (Uninhibited) Not acceptable.

vinylmagnesium chloride $\text{CH}_2\text{:CHMgCl}$, dissolved in tetrahydrofuran. Available in up to 55-gal drums. Used as a Grignard reagent.

vinyl methyl ether (methyl vinyl ether; methoxyethylene; MVE) $\text{CH}_2\text{:CHOCH}_3$.

Properties: Colorless, compressed gas, or colorless liquid; sp. gr. 0.7500 ($20/20^\circ\text{C}$); b.p. 6.0°C ; vapor pressure 1052 mm (20°C); flash point -60°F ; f.p. -121.6°C . Slightly soluble in water; soluble in alcohol and ether; easily polymerized; commercial mate-

rial contains a small proportion of polymerization inhibitor.

Derivation: Catalytic reaction of acetylene and methyl alcohol.

Grades: Technical (95% min); pure.

Containers: 150-lb cylinders; single-unit tank cars and ton multi-unit (TMU) tank cars.

Hazard: Highly flammable; severe fire and explosion risk. Explosive limits in air 2.6 to 39%.

Uses: Copolymers used in coatings and lacquers; modifier for alkyl, polystyrene and ionomer resins; plasticizer for nitrocellulose and adhesives. See polyvinyl methyl ether.

Shipping regulations: (Inhibited) (Rail) Red gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. (Uninhibited) Not acceptable.

vinyl methyl ketone (3-buten-2-one; methyl vinyl ketone) $\text{CH}_3\text{COCH}_2\text{CH}_3$.

Properties: Colorless liquid; sp. gr. 0.8636 ($20/4^\circ\text{C}$); b.p. 80°C ; miscible with water; soluble in alcohol. Flash point 20°F (closed cup).

Hazard: Flammable, dangerous fire risk. Skin and eye irritant.

Use: Monomer for polymerization; component of ionomer resins.

Shipping regulations: (Rail) Red label. (Air) (Inhibited) Flammable Liquid label. (Uninhibited) Not acceptable. Legal label name methyl vinyl ketone.

vinyl plastics. See polyvinyl resins.

vinyl propionate $\text{CH}_2\text{:CHOOCCH}_2\text{CH}_3$.

Properties: Liquid; sp. gr. 0.9173 ($20/20^\circ\text{C}$); b.p. 95.0°C ; f.p. -81.1°C ; flash point 34°F (open cup). Almost insoluble in water. Low toxicity.

Containers: 55-gal drums; tank cars.

Hazard: Flammable, dangerous fire risk.

Uses: Polymer; emulsion paints.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

vinylpyridine $\text{C}_5\text{H}_5\text{NCH:CH}_2$.

Properties: Colorless liquid, boils with resinification at about 159°C ; sp. gr. 0.9746 (20°C); refractive index 1.5509 ($n_{20/D}$). Dissolves in water to extent of 2.5%; water dissolves in it to about 15%; soluble in dilute acids, hydrocarbons, alcohols, ketones, esters. Commercial material contains inhibitor. Combustible.

Containers: Drums; tank cars.

Hazard: Probably toxic and irritant to skin and eyes.

Uses: Elastomers and pharmaceuticals. Latex used as tire cord binder (41% solids). The latex is copolymerized with butadiene-styrene.

N-vinyl-2-pyrrolidone $\text{CH}_2\text{:CHNCH}_2\text{CH}_2\text{CH}_2\text{CO}$.

Properties: Colorless liquid; b.p. 148°C (100 mm); m.p. 13.5°C ; flash point 209°F (COC); sp. gr. 1.04. Combustible.

Derivation: From acetylene and formaldehyde by high-pressure synthesis.

Hazard: Probably irritant and narcotic in high concentrations.

Uses: Polyvinylpyrrolidone; organic synthesis.

vinyl stabilizer. A substance added to vinyl chloride resins during compounding, to retard the rate of deterioration due to formation of hydrogen chloride. Many combine readily with hydrogen chloride but do not otherwise interfere with the properties and uses of the final product. Amines, basic oxides, and metallic soaps are commonly used.

vinyl stearate $\text{CH}_3(\text{CH}_2)_{16}\text{COOCH}:\text{CH}_2$.

Properties: White, waxy solid. M.p. 28–30°C; b.p. 175°C (3 mm); sp. gr. 0.9037 (20/20); refractive index 1.4355–1.4362 (n_D 55/D); iodine no. 80–82. Insoluble in water and alcohol; moderately soluble in ketones and vegetable oils; soluble in most hydrocarbon and chlorinated solvents. Combustible. Low toxicity.

Containers: 35-, 210-, and 390-lb drums.

Uses: Plasticizer (copolymerizer); lubricant.

vinylstyrene. See divinyl benzene.

vinyltoluene (methyl styrene) $\text{CH}_2:\text{CHC}_6\text{H}_4\text{CH}_3$.

Properties: Colorless liquid; f.p. –76.8°C; b.p. 170–171°C; sp. gr. 0.890 (25/25°C); lb/gal 7.41; refractive index 1.534 (n_D 34/D); flash point 130°F (C.C.). Autoignition temp. 921°F. Very slightly soluble in water. Soluble in methanol, ether. Combustible.

Containers: Drums; tank cars.

Hazard: Moderate fire risk. Moderately toxic. Tolerance, 100 ppm in air.

Uses: Solvent; intermediate.

vinyl trichloride. See 1,1,2-trichloroethane.

vinyltrichlorosilane $\text{CH}_2\text{CHSiCl}_3$.

Properties: Colorless or pale yellow liquid. B.p. 90.6°C; sp. gr. 1.265 (25/25°C); refractive index (n_D 20/D) 1.432; flash point 16°F. Readily hydrolyzed, with liberation of hydrochloric acid; polymerizes easily. Soluble in most organic solvents; reacts with alcohol.

Derivation: Reaction of acetylene and trichlorosilane (peroxide catalyst); reaction of trichlorosilane with vinyl chloride.

Grade: Technical.

Hazard: Flammable, dangerous fire risk. Highly toxic by ingestion and inhalation. Strong irritant to tissue.

Uses: Intermediate for silicones; coupling agent in adhesives and bonds.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

"Vinymul."¹⁷⁰ Trademark for a textile finisher for all fabrics or fibers where flexibility is desired at low temperatures, such as back-coating or immersion finishing of automobile fabrics. Also as primer with adhesives on vinyl pressure sensitive tapes or as a prime coat on metal for adhesion to metal and improved adhesion for second protective coating.

vinylon. Generic name for a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 85% by weight of vinyl chloride units, $-\text{CH}_2\text{CHCl}-$ (Federal Trade Commission). It has good resistance to chemicals, bacteria, moths; is unaffected by water and sunlight; low softening point. Tenacity 3.1 grams per denier; difficult to ignite; self-extinguishing. See polyvinyl chloride.

"Vinyzene."¹¹ Trademark for series of fungicides and bactericides formulated as additives to vinyls. Typical formulation is a condensation product of epoxidized soybean oil and 10,10'-oxybisphenoxarsine, functioning as both primary plasticizer-stabilizer and biocide.

Hazard: Probably toxic by ingestion and inhalation

"Viocin."²⁹⁹ Trademark for viomycin sulfate.

"Vioform."³¹⁴ Trademark for iodochlorhydroxyquin.

"Violamine."³⁰⁷ Trademark for a series of acid dye-stuffs. Used on wool and silk. Fairly good fastness to light, washing, fulling, etc. Can also be used on paper and leather.

violanthrone. See dibenzanthrone.

Violet No. 1. An FD&C color used for meat grading, cosmetics, beverages, etc. It is a triphenylmethane dye. Banned by the FDA in 1973 due to possible carcinogenic risk.

violet gentian. See methyl violet.

"Violite."⁴ Trademark for a series of fluorescent and phosphorescent pigments, based on such phosphors as zinc sulfide-cadmium sulfide and cadmium sulfide-strontium sulfide.

Uses: Printing inks, paints, lacquers, watercolors, paper, marking material, etc.

viomycin. An antibiotic produced by *Streptomyces puniceus*. Unique among antibiotics in that it is more active against acid-fast organisms than against other groups. Mycobacteria are most sensitive to viomycin, and the antibiotic is active against strains of *Mycobacterium tuberculosis* which are resistant to other antibiotics. Available commercially as sulfate.

"Vircol."⁴⁰ Trademark for neutral phosphorus polyols, used as flame retardant for urethane foams and plasticizer for polyvinyl alcohol.

"Virco-Pet."⁴⁰ Trademark for neutral organic phosphorus compounds for use as a corrosion inhibitor for steel and aluminum. Tan, viscous liquids, miscible with a variety of organic solvents; sp. gr. 0.96–1.06 (20°C).

"Virgin Rock."¹ Trademark for a 99.8% pure sulfur cast in solid barrels.

Uses: For applications in which a clean, pure sulfur is needed for melting, or for burning to form sulfur dioxide (fumigation, sugar and starch refining, bleaching of wool and straw, "sulfuring" of hops and grouting of machinery foundations).

"Virgo" Salts.⁶² Trademark for salts for fused salt baths, for descaling, desanding, and otherwise cleaning metal products.

"Viridine."²²⁷ Trademark for phenylacetaldehyde dimethylacetal (q.v.).

virus. An infectious agent composed almost entirely of protein and nucleic acids (nucleoprotein, q.v.). Viruses can reproduce only within living cells, and are so small they can be resolved only with an electron microscope. Since they pass through filters that retain bacteria, they are often called filtrable viruses. Tobacco mosaic was the first virus to be crystallized and isolated (Dr. W. M. Stanley, 1935); it contains some 2000 protein molecules in a sequence of 158 amino acids (m. w. 40,000,000). Bushy stunt virus, found in tomato plants, has a m.w. of 7,600,000. First synthesis of a virus was reported in 1967.

"Viruses differ from organisms in that they are only half alive; they lack metabolism, are unable to utilize oxygen, to synthesize macromolecules, to grow or to die. They are parasites, relying on a living host cell." They account for many diseases, including mumps, measles, scarlet fever, smallpox, influenza, and possibly the common cold. Their shapes are similar to those of bacteria (rods, spheres, fila-

ments). They have the ability to mutate; they are also antigenic and thus initiate formation of antibodies. Some act as bacteriophages (q.v.). A direct relation between virus and cancer has been shown, the DNA of the virus becoming irreversibly bound to the DNA of the affected cells. See also bacteria; deoxyribonucleic acid.

"Viscarin."¹²⁴ Trademark for carrageenan extractives from Irish moss. Dry, free-flowing powder packed in fiber drums.

Uses: Gelling, suspending, binding and viscosity-building in food products.

"Viscasil."²⁴⁵ Trademark for a series of polish grade dimethyl silicone fluids. Available in viscosities from 50 to 1,000 centistokes at 25°C. Are not compatible with waxes and act as lubricants, producing a polish which is more easily rubbed out and gives a higher gloss.

"Viscolan."⁴⁹³ Trademark for liquid lanolin consisting of low melting point esters isolated by physical fractionation. A crystal-clear amber viscous liquid; anhydrous; soluble in mineral and vegetable oils. Uses: Nonionic w/o emulsifier; pigment dispersant; plasticizer; emollient.

viscose process. The best-known process for making regenerated cellulose (rayon) by converting cellulose to the soluble xanthate, which can be spun into fibers and then reconverted to cellulose by treatment with acid. Wood pulp is steeped with 17-20% caustic soda; the resulting alkali cellulose is pressed to remove excess liquor and the soluble beta- and gamma-cellulose, and then shredded and aged. It is then treated with carbon disulfide and sodium hydroxide to form an orange, viscous solution of cellulose xanthate. After filtration and deaeration, this solution (viscose) is forced through minute spinneret openings (or long slit dies in the case of cellophane) into a bath containing sulfuric acid and various salts such as sodium and zinc sulfate. The salts cause the viscose to gel immediately, forming a fiber or film of sufficient strength to permit it to be drawn through the bath under tension. At the same time the sulfuric acid decomposes the xanthate, converting the fibers to cellulose, in which form they are washed and dried. See also rayon; cellophane.

viscosity. The internal resistance to flow exhibited by a fluid. A liquid has a viscosity of one poise if a force of one dyne per square centimeter causes two parallel liquid surfaces one square centimeter in area and one centimeter apart to move past one another at a velocity of one centimeter per second. One poise equals 100 centipoises (cp). Viscosity in centipoises divided by the liquid density at the same temperature gives kinematic viscosity in centistokes (cs). One hundred centistokes equal 1 stoke. To determine kinematic viscosity, the time is measured for an exact quantity of liquid to flow by gravity through a standard capillary.

Water is the primary viscosity standard with an accepted viscosity at 20°C of 0.01002 poise. Hydrocarbon liquids such as hexane are less viscous. Molasses may have a viscosity of several hundred centistokes, while for a very heavy lubrication oil the viscosity may be 100 centistokes. There are many empirical methods for measuring viscosity which generally involve measurement of the time of flow or movement of a ball, ring or other object in a specially shaped or sized apparatus. See Saybolt Universal Viscosity; liquid; liquid, Newtonian.

viscosity index improver. A lubricating oil additive that has the effect of increasing the viscosity of the oil in such a way that it is greater at high temperature than at low temperature. Agents used for this purpose are polymers of alkyl esters of methacrylic acid, polyisobutylenes, etc.

viscosity, kinematic. See viscosity.

"Viscotone."²⁷¹ Trademark for a mineral by-product used for oil-well drilling muds, tanning agents, ore dressing, dispersants and emulsifiers.

"VisKing."³¹³ Trademark for plastic film and sheets for wrapping, packaging and containers; rods, bars and tubing.

"Vistac."²³⁰ Trademark for a series of synthetic hydrocarbon polymers used in rubber-base adhesives and cements, waxes and asphalts, paints and caulking compounds, and in latex and asphalt emulsions.

"Vistalon." Trademark for an ethylene-propylene rubber, claimed to have excellent resistance to ozone and weathering, heat resistance, low-temperature flexibility and resistance to acids and detergents. Uses: Automotive appliances; industrial hose; cable insulation; electrical equipment.

"Vistanex."²⁹ Trademark for polyisobutylene (q.v.) a thermoplastic saturated polymer unvulcanizable by itself, but frequently added to impart special properties to other elastomers. Also used in unvulcanized compositions, alone and in combinations. Soluble in hydrocarbon solvents. Uses: Cable insulation compounds; pressure-sensitive tapes and adhesives; caulking and sealing compounds; additives to wax, asphalt, and polyethylene; viscosity index improver.

visual purple. See rhodopsin.

vitamin. Any of a number of complex organic compounds, present in natural products or made synthetically, which are essential in small proportions in the diet of animals and man. Some are fat-soluble (A, D, K); others are water-soluble (B complex, C). Their precursors are called provitamins (q.v.). A normal diet usually contains sufficient vitamins for health; their use in medicine is restricted to correction of specific metabolic deficiencies. Some authorities believe that habitual intake of standard vitamin preparations readily available on the market is of little if any nutritional benefit. The following list of cross-references will serve to locate technical information about the various vitamin entries in this book:

Vitamin A. See carotene, cryptoxanthin, retinol, 3-dehydroretinol; provitamin.

Vitamin B. See Vitamin B complex; also thiamine, riboflavin, niacin, pantothenic acid, biotin, cobalamin, pyridoxine, folic acid, inositol.

Vitamin C. See ascorbic acid.

Vitamin D. See ergosterol, ergocalciferol, cholecalciferol.

Vitamin E. See tocopherol.

Vitamin K. See phytonadione, menadione, phthiocol.

vitamin B complex. A group of closely interrelated vitamins found in rice bran, yeast, wheat germ, etc., originally thought to be one substance. Studies carried out by R. J. Williams and associates later revealed the astonishing complexity of this group. He states as follows: "The physiological activity originally observed was due to the additive effect of a considerable number of substances, each one of

which is of itself essential. If and when the designations B₁, B₂, B₃, etc., are used, they have an entirely different meaning from the parallel use of D₁, D₂, D₃, or K₁ and K₂, because in the case of the D and K vitamins one form can replace another. In the case of the B vitamins each form is a distinctly different substance with different functions, and each member of the family is separately indispensable. No one B vitamin can replace any other."

"Vitel."²⁶⁵ Trademark for a series of polyester resins; for spinning into polyester staple and high tenacity fibers for wearing apparel, industrial fabrics, tire cord; for extrusion of high strength monofilaments and film; for extrusion coating on paper, textiles, foils, plastics; also used as hot melt resins.

"Vithane."²⁶⁵ Trademark for a cured or curable polyurethane coating resin of high molecular weight.

Uses: Coatings for tent fabrics, ponchos, fire hose, industrial belting, magnetic recording tape, balloons and other air-filled structures.

"Viton."²⁸ Trademark for a series of fluoroelastomers based on the copolymer of vinylidene fluoride and hexafluoropropylene, with the repeating structure possibly $-\text{CF}_2-\text{CH}_2-\text{CF}_2-\text{CF}(\text{CF}_3)-$.

Properties: White transparent solid; sp. gr. 1.72-1.86. Resistant to corrosive liquids and chemicals up to 600°F. Useful continuous service at 400-450°F. Resistant to ozone, weather, flame, oils, fuels, lubricants, many solvents. Radiation resistance good. Nonflammable.

Uses: Gaskets, seals, diaphragms, tubing; aerospace and automotive components; high vacuum equipment; low-temperature and radiation equipment.

"Vitrafos."¹ Trademark for a clear, glassy, granular sodium phosphate.

Properties: Phosphorus pentoxide, 63% min; sieve size, 10- to 80-mesh screen; pH (1% soln), 7.8; bulk density 79 lb/cu ft.

Uses: Detergent builder; deflocculating agent in oil-well drilling muds; sequestering agent in the textile industry.

"Vitreasil."²⁰ Trademark for a high-quality natural silica, fused into a pure and uniform woven fabric containing over 99.8% SiO₂. Available in translucent and transparent forms. Used as filter medium.

vitreous. Descriptive of a material having the appearance and properties of a glass, i.e., a hard, amorphous, brittle structure, as in porcelain enamel. See vitrification; glass.

vitreous enamel. See porcelain enamel.

"Vitrex."⁴¹ Trademark for an acid-proof silicate cement which sets by chemical action. Inert to acids, except hydrofluoric, up to 2100°F.

"Vitric 10."³²⁶ Trademark for a silicate base acid proof, chemical setting cement suitable for use with strong oxidizing acids such as nitric and chromic.

vitrification. The process of converting a siliceous material into glass or a glassy substance by heat, fusion, and slow cooling.

vitriol. An obsolete term once used to refer to a number of sulfates (lead, copper, zinc) because of their glassy appearance. Sulfuric acid was called oil of vitriol. Derived from vitrum (glass).

"Vitrebond."⁴¹ Trademark for a plasticized sulfur cement, resistant to nonoxidizing acids, oxidizing acids, acid and neutral salts, up to 200°F.

"Vitreplast."⁴¹ Trademark for a polyester resin cement, resistant to nonoxidizing acids, acid and neutral salts, some organic solvents and weak alkalies, up to 275°F.

"Vituf."²⁶⁵ Trademark for polyester extrusion resins designed for jacket applications over electrical wire insulations as a replacement for nylon over vinyl and polyethylene.

Uses: Aircraft, auto and electronic hook-up wire, building wire, missile ground cable.

"Vivana."⁵⁶⁵ Trademark for fibers, filaments and yarn of polymers and interpolymers of vinylidene chloride.

"Vix-Syn."³²⁰ Trademark for synthetic rubber products. Made of duck or asbestos with neoprene or butyl polymers.

"Viz-Thin."⁴⁸ Trademark for a ferro-chrome lignin sulfonate, used as a thinner for gypsum base oil well drilling muds.

V.M.&P. naphtha. See under naphtha.

voids. Empty spaces of molecular dimensions occurring between closely packed solid particles, as in powder metallurgy. Their presence permits barriers made by powder metallurgy techniques to act as diffusion membranes for separation of uranium isotopes in the gaseous diffusion process. See diffusion, gaseous.

"Volan."²⁸ Trademark for a Werner type chromium complex (methacrylatochromic chloride, q.v.) in isopropanol.

Used as a bonding agent for glass fibers, paper, wood, and polymeric coatings.

volatility. The tendency of a solid or liquid material to pass into the vapor state at a given temperature. Specifically the vapor pressure of a component divided by its mole fraction in the liquid or solid.

"Volck."²⁵³ Trademark for refined petroleum oil used as a phytonomic contact insecticide.

Volhard's solution. A solution of potassium thiocyanate used in analytical chemistry.

voltaic cell. Two conductive metals of different potentials in contact with an electrolyte which generate an electric current. The original voltaic cell was comprised of silver and zinc, with brine-moistened paper as electrolyte. Semisolid pastes are now used; electrodes may be lead, nickel, zinc or cadmium.

volumetric analysis. See titration.

"Voramate."²³³ Trademark for a series of urethane intermediates which are the reaction products of polyols and isocyanates. They are adducts or quasi-prepolymers to be used in combination with "Voranol" products to obtain rigid urethane foams.

"Vorane."²³³ Trademark for a group of polyurethane chemicals, raw materials for polyurethane elastomers, coatings and foams.

"Voranol."²³³ Trademark for a series of polyols used as intermediates in urethane elastomers, coatings, flexible and rigid foams.

"Voraspan."²³³ Trademark for urethane resins.

"Vorite."²⁰² Trademark for a series of ricinoleate urethane prepolymers for use in protective coatings, foams, elastomers and adhesives. Cured with polyols (see "Polycin") or catalyst.

VPC. Abbreviation for vapor-phase chromatography. See gas chromatography.

"VPM."²⁸ Trademark for a solution containing 32.7% sodium methylthiocarbamate used as a soil fumigant. Containers: 1-gal bottles; 5- and 30-gal drums.

"V-S-P."¹⁶⁰ Trademark for thermoplastic voltage-stabilized polyethylene; used in power cables.

"Vulca."⁵³ Trademark for a series of ether derivatives of ungelatinized starch; graded by resistance to swelling in boiling water. "Vulca" 100 is completely nonswelling, resistant to agents that gelatinize starch, retains stability during autoclaving and pressure cooking, and may be steam sterilized without any appreciable change in its powdery appearance. Uses: Thickeners; cosmetics; dusting powders.

"Vulcalock."¹¹⁹ Trademark for rubber-based adhesive especially designed for bonding rubber to metals.

"Vulcan."²⁷⁵ Trademark for oil furnace carbon blacks for rubber and plastics.

vulcanization. A physicochemical change resulting from cross-linking of the unsaturated hydrocarbon chain of polyisoprene (rubber) with sulfur, usually with application of heat. The precise mechanism which produces the network structure of the cross-linked molecules is still incompletely known. Sulfur is also used with unsaturated types of synthetic rubbers; some types require use of peroxides, metallic oxides, chlorinated quinones, or nitrobenzenes. Natural rubber can be vulcanized with selenium, organic peroxides and quinone derivatives, but these have limited industrial use; high-energy radiation curing is an important innovation.

Vulcanization can be effected with sulfur alone in high percentage, but the time required is too long to be economic and the properties obtained are poor. Inorganic accelerators and metallic oxides (usually zinc) are essential for satisfactory cure. Organic accelerators (q.v.), introduced in the early 1920's, notably shortened vulcanization time.

Three factors affect the properties of a vulcanizate: (1) the percentage of sulfur and accelerator used; (2) the temperature; and (3) time of cure. Sulfur percentage is usually from 1 to 3%; with strong acceleration the time can be as short as three minutes at high temperature (150°C). Vulcanization can also occur at room temperature with specific formulations (self-curing cements).

Vulcanization was discovered in 1846 by Charles Goodyear in the U.S. and simultaneously by Thomas Hancock in England. Its over-all effect is to convert rubber hydrocarbon from a soft, tacky, thermoplastic to a strong, temperature-stable thermoset having unique elastic modulus and yield properties. See also rubber; rubber, synthetic.

"Vulcoid."²⁸¹ Trademark for a resin-impregnated vulcanized fiber. A light-weight electrical insulator of great mechanical adaptability which has arc and

moisture resistance and can be drawn and formed. Approved by Underwriters' Laboratories as Class A Insulation.

Forms: Sheets; tubes; rods; fabricated parts.

Uses: Contact and instrument panels; knife switch guides; arc deflector spacer bushings; electrical insulation; motor and transformer lead bushings and terminal blocks.

"Vulcosal."²³³ Trademark for the industrial grade of salicylic acid; used as a stabilizer and retarder of vulcanization.

"Vulklor."²⁴⁸ Trademark for tetrachloro-para-benzoquinone; used as a vulcanizing agent.

"Vulkollan."⁴⁷⁰ Trademark for urethane elastomers. See polyurethane.

"Vultac."²⁰⁴ Trademark for a series of vulcanizing agents composed chiefly of alkyl phenol disulfides.

"Vultex."⁵⁷² Trademark for a vulcanized rubber or synthetic rubber latex. Used especially for surgeons' gloves, drug sundries, dipped products, adhesives.

"Vycor" Brand Glass No. 7900.²⁰ Trademark for a glass made by a process in which an article fabricated by conventional methods is chemically leached to remove substantially all of the ingredients except silica. When fired at high temperatures a transparent glass of high softening point and extremely low expansion coefficient is produced.

Physical properties: Softening point approximately 1500°C. Temperature limit in service, 900°C. Linear coefficient of expansion per °C, 0.0000008; sp. gr. 2.18; refractive index 1.458. (A similar glass, No. 7910, will transmit over 60% radiation at 254 millimicrons in 2 mm section.)

Uses: Laboratory and industrial glassware, including beakers, crucibles, flasks, dishes, tubes, cylinders, containers, flat glass rods.

"Vycron."²⁸⁷ Trademark for a polyester fiber (q.v.).

"Vygen."¹⁷⁹ Trademark for a complete series of polyvinyl chloride polymers.

Uses: Film, sheeting, coated fabrics, luggage, wall covering, extruded goods, gaskets, wire insulation, toys, and automotive parts.

"Vynex."⁴⁸² Trademark for an extruded rigid vinyl sheet with exceptional clarity and gloss finish. Available in sheet or roll form for a wide range of applications such as transparent film, book bindings, dictating records, identification cards, etc.

"Vyn-Eze."⁴³⁰ Trademark for a specially prepared fatty acid amide used as an internal mold release agent in PVC molded products.

"Vynolour."⁴³⁸ Trademark for pigments dispersed on vinyl copolymer for use in vinyl chloride and vinyl chloride-vinylidene chloride types for inks, calendering solution resin coatings, extrusion and molding.

"Vyron."⁴¹ Trademark for a porous plastic of high density polyethylene of the Ziegler type. Its permeability is uniform at 50 microns, permitting retention of particles down to 25 microns. Used for filtering, pneumatic silencing and fluidizing applications.

W

W Symbol for tungsten.

"W-545."³⁰⁸ Trademark for an austenitic iron-base precipitation-hardening alloy containing nickel, chromium, and small proportions of molybdenum, titanium, boron, silicon, and manganese. Developed primarily for improved gas turbine discs, critical components of jet engines.

"Wallpol."³⁶ Trademark for colloidal dispersions of solid polyvinyl acetate resin particles in water. Used in interior and exterior paints and primer sealers.

"Warcobase A."⁴² Trademark for a mixed stearylurea (60% mono, 40% di-stearyl); off-white granules; m.p. 107–110°C.

Uses: Antistatic agent in plastics; chemical intermediate.

"Warcocide."⁴² Trademark for a series of germicides. 1400. Methyl-naphthyl-dodecyl-dimethyl-ammonium chloride.

1450. A 50% solution in aqueous isopropanol of tetradecylbenzyl-dimethylammonium chloride monohydrate. Used in the paper industry.

TMB. Trimethylbenzyl-dodecyl-dimethyl ammonium chloride.

"Warcoflex."⁴² Trademark for a three-component polyurethane system: BR-233, base resin; CL-239, crosslinking agent; A-240, accelerator. When mixed they produce a system highly adhesive, flexible, resistant to solvents, with good properties over a wide temperature range.

"Warco" GFC, GFI, GND.⁴² Trademark for a series of gas-fading inhibitors for acetate fabrics. High molecular weight amino compounds and blend of organic amines.

"Warcosol" NF3.⁴² Trademark for a complex of surface-active sulfonated polyester and phosphorated alcohol. Uses: Dish- and bottle-washing compounds; adhesives and asphalt emulsions; alkaline and acid metal-cleaning; package- and pad-dyeing of textiles with vat and sulfur colors; acid-dyeing of wool.

warfarin (3-(alpha-acetonylbenzyl)-4-hydroxycoumarin) $C_6H_4C_3O(OH)(O)CH(CH_2COCH_3)C_6H_5$.

Properties: Colorless, odorless, tasteless crystals; m.p. 161°C. Soluble in alcohol and ether; insoluble in water. Also available as sodium salt.

Derivation: Condensation of benzylideneacetone and 4-hydroxycoumarin.

Grade: Technical.

Containers: Drums.

Hazard: Highly toxic by ingestion. Tolerance, 0.1 mg per cubic meter in air.

Use: Rodenticide.

Shipping regulations: (Air) Poison label.

warning label. See label (1).

wash-and-wear fabric. See aminoplast resin.

waste treatment. Waste materials can be classified by type as gaseous, liquid, solid, and radioactive, and by source as industrial, agricultural, urban, and nuclear. Many methods of treating wastes, either by converting them to useful by-products or to dispose of them, are in operation or under experimentation. Dumping in streams and rivers has long been illegal, and ocean dumping has been prohibited since 1973. Older treatment methods include incineration (garbage, paper, plastics); precipitation (smoke, solid-in-liquid suspensions); adsorption (gases and vapors); chemical treatment (neutralization, ion-exchange, chlorination); reclamation of sulfite liquors (paper industry); recycling; bacterial digestion (sewage); comminution and melting (glass, metals). Some cases may involve a combination of these.

Several new techniques have recently been researched and some are now in limited use. (1) Flash pyrolysis of certain solid wastes yields synthetic fuel oil and other useful products (see pyrolysis). (2) Urban, animal and agricultural wastes can be fermented by anaerobic bacteria to yield proteins, fuel oil, etc.; the possibilities of converting cannery and other food-processing wastes into protein-rich foods and feeds are being investigated. (3) Catalytic oxidation of exhaust emission gases; devices have been installed in cars since 1973 for air-pollution control. (4) Recovery of methane from manures. (5) Incorporation of special additives to certain plastics (polystyrene bottles) to render them biodegradable. (6) High-pressure hydrogenation of garbage to yield a low-sulfur combustible oil. (7) Deactivating radioactive wastes by adsorption or ion exchange, as well as by solidification and hydraulic fracturing; high-activity wastes are buried, but no longer sea-dumped. (8) Catalytic oxidation of waste chlorinated hydrocarbons, with partial recovery of chlorine. See also air pollution; water pollution.

waste paper, wet. Flammable solid. DOT requires a Yellow label; not accepted by express.

waste textile, wet. See waste paper, wet.

waste wool, wet. See wool waste.

"Watchung."²⁸ Trademark for precipitated diazo red pigments.

water (ice, steam) HOH

Properties: Colorless, odorless, tasteless liquid; allotropic forms are ice (solid) and steam (vapor). Water is a polar liquid with high dielectric constant (81 at 17°C); this largely accounts for its solvent power. It is a weak electrolyte, ionizing as H_3O^+ and OH^- . At atmospheric pressure it has sp. gr. 1.00 (4°C); freezing pt. 0°C (32°F), and expands about 10% on freezing; viscosity 0.01002 poise (20°C); sp. heat 1 caloric per gram; vapor pressure (100°C) 760 mm Hg. Triple point 0.00°C at 4.6 mm Hg. Surface tension 73 dynes/cm at 20°C. Latent heat of fusion (ice) 80 cal/gram; latent heat of condensation (steam), 540 cal/gram. Wt. per gallon (15°C) 8.337 lbs; wt. per cu ft

62.3 lbs. Refractive index 1.333. Water may be superheated by enclosing in an autoclave and increasing pressure; it may be supercooled by adding sodium chloride or other ionizing compound. It has definite catalytic activity, especially of metal oxidation. Physiologically water is classed as a nutrient substance. Derivation: (1) Oxidation of hydrogen; (2) end product of combustion; (3) end product of acid-base reaction; (4) end product of condensation reaction.

Purification: (1) Distillation; (2) ion exchange reaction (zeolite); (3) chlorination; (4) filtration.

Containers: Glass carboys; tank cars; pipelines.

Uses: Paper making; textile processing; solvent and diluent; industrial coolant; filtration; washing and scouring; sulfur mining; hydrolysis; Portland cement; hydraulic systems; power source; steam generation; food industry; source of hydrogen by electrolysis and thermochemical decomposition (see under hydrogen). See also ice; steam; heavy water; ocean water; mineral water; water, hard.

water, bound. See bound water.

water gas (blue gas). A mixture of gases made from coke, air, and steam. The steam is decomposed by passing it over a bed of incandescent coke, or by high-temperature reaction with natural gas or similar hydrocarbons. Carbon monoxide about 40%, hydrogen about 50%; carbon dioxide about 3% and nitrogen about 3%.

Hazard: Flammable, dangerous fire and explosion risk.

Explosive limits 7 to 72% in air. Toxic by inhalation.

Uses: Organic synthesis; fuel gas; formerly for ammonia synthesis.

See also synthesis gas.

water glass. See sodium silicate.

water, hard. Water containing low percentages of calcium and magnesium carbonates, bicarbonates, sulfates or chlorides, as a result of long contact with rocky substrates and soils. Degree of hardness is expressed either as grains per gallon or parts per million (ppm) of calcium carbonate. (1 grain of CaCO_3 per gallon is equivalent to 17.1 ppm). Up to 5 grains is considered soft; over 30 grains is very hard. Hardness may be temporary (carbonates and bicarbonates) or permanent (sulfates, chlorides). Treatment with zeolites (q.v.) is necessary to soften permanently hard water. Temporary hardness can be reduced by boiling. These impurities are responsible for boiler scale (q.v.) and corrosion of metals on long contact. Hard waters require use of synthetic detergents for satisfactory "sudsing." See also zeolite.

water of crystallization. Water chemically combined in many crystallized substances; it can be removed at or near 100°C , usually with loss of crystalline properties.

water pollution. Contamination of fresh or salt water with materials that are toxic, noxious, or otherwise harmful to fish and other animals, and to man, including thermal pollution (q.v.). Disposal of untreated chemical and municipal wastes in streams and rivers has been illegal since the early 1900's; in 1973 the EPA prohibited dumping of all types of wastes into the ocean. Unintentional pollution results from run-off containing toxic insecticidal residues. Oil spills at sea are a continual problem and probably will remain so. See also waste treatment; pollution; toxic material; oil spill treatment.

waterproofing agent. (1) Any film-forming substance which coats a substrate with a water-repellent layer, such as a paint, a rubber or plastic film, a wax, or an asphaltic compound. These are used on a wide variety

of surfaces, including cement, masonry, metals, textiles, etc.

(2) Any metal salt or other chemical which impregnates textile fibers in such a way as to give an air-permeable, water-resistant product. There are three types of these: renewable, semidurable, and durable. Renewable repellents (e.g., "Aridex") are water dispersions containing aluminum acetate or formate, emulsifying agents and protective colloids in the continuous phase, and a blend of waxes in the disperse phase. Semidurable repellents involve precipitation of insoluble metal salts on the fibers; water-soluble soaps and waxes are usually added to the mixture, which is especially effective on synthetic fibers. Durable repellents coat each fiber with a protective film without bonding them together or sealing the apertures. Several trademarked products are used (see, e.g., "Zelan," "Norane"), some containing fatty pyridinium salts.

water purification (water conditioning). Any process whereby water is treated in such a way as to remove or reduce undesirable impurities. The following methods are used: (1) sedimentation, in which coarse suspended matter is allowed to settle by gravity in special tanks or reservoirs; (2) coagulation of aggregates (called "floc") by means of aluminum sulfate, ferric sulfate, or sodium aluminate (the aggregates are formed from colloiddally dispersed impurities activated by the coagulant); (3) filtration through a bed of fine sand, either by gravity flow or by pressure, to remove suspended particles; (4) chlorination, which is effective in sterilizing potable water, swimming pools, etc.; (5) adsorption on activated carbon for removal of organic contaminants causing unpleasant taste and odor; (6) hardness removal by ion-exchange or zeolite process.

USDA reported (1973) that mercury can be removed from water by treatment with low percentages of black liquor from kraft papermaking.

water-soluble gum. See gum, natural.

water-soluble oil. Ammonia, potash, or sodium soaps of oleic, rosin, or naphthenic acids dissolved in mineral oils.

Uses: Boring; lathe-cutting; milling; polishing lubricants; dressing textile fibers; dust laying.

See also soluble oil.

water-soluble resin. See polymer, water-soluble.

wattle bark (Australian bark, mimosa bark).

Derivation: From the Australian wattles and South African acacias. Bark contains 25-35% tannin.

Grades: Based on tannin content.

Use: Source of wattle bark extract, used in vegetable tanning of leather, especially retannage of upper leathers and production of heavy leathers.

wax. A low-melting organic mixture or compound of high molecular weight, solid at room temperature and generally similar in composition to fats and oils except that it contains no glycerides. Some are hydrocarbons; others are esters of fatty acids and alcohols. They are classed among the lipids. Waxes are thermoplastic, but since they are not high polymers, they are not considered in the family of plastics. Common properties are water repellency; smooth texture; nontoxicity; freedom from objectionable odor and color. They are combustible, and have good dielectric properties. Soluble in most organic solvents; insoluble in water. The major types are as follows:

1. Natural

1. Animal (beeswax, spermaceti, lanolin, shellac wax)

2. Vegetable (carnauba, candelilla, bayberry, sugarcane)

3. Mineral

- (a) Fossil or earth waxes (ozocerite, ceresin, montan)
- (b) Petroleum waxes (paraffin, microcrystalline petrolatum) (slack or scale wax)

II. Synthetic

- 1. Ethylenic polymers and polyol ether-esters ("Carbowax," sorbitol)
 - 2. Chlorinated naphthalenes ("Halowax")
 - 3. Hydrocarbon type via Fischer-Tropsch synthesis
- Uses: Polishes; candles; crayons; sealants; sun-cracking protection of rubber and plastic products; cosmetics; paper coating; packaging food products; electrical insulation; waterproofing and cleaning compounds; carbon paper; precision investment casting. See also following entries.

wax, chloronaphthalene

Properties: Translucent, black, light, and varied colors. Sp. gr. 1.40–1.7 (300°F); m.p. 190–265°F; b.p. 550–700°F. Soluble in many organic solvent liquids and oils (when heated together).

Derivation: By chlorinating naphthalene.

Containers: 130-lb drums.

Hazard: Toxic by ingestion and skin contact.

Uses: Condenser impregnation; moisture-, flame-, acid-, insect-proofing of wood, fabric and other fibrous bodies; moisture- and flame-proofing covered wire and cable; solvent (for rubber, aniline and other dyes, mineral and vegetable oils, varnish gums and resins, and other waxes when mixed in the molten state).

wax, microcrystalline. A wax, usually branched-chain paraffins, characterized by a crystal structure much smaller than that of normal wax and also by much higher viscosity. Obtained by dewaxing tank bottoms, refinery residues and other petroleum waste products, they have an average molecular weight of 500–800 (about twice that of paraffin). Viscosity 45–120 seconds (SUS at 210°F); penetration value from 3 to 33. Petroleum-derived products are used for adhesives, paper coating, cosmetic creams, floor wax, electrical insulation, heat-sealing, glass fabric impregnation, leather treatment, emulsions, etc. Some natural products, notably chlorophyll, are classed as microcrystalline waxes.

wax, polymethylene. White, odorless solid with congealing point of 205°F. Offered in flaked form. Approved by FDA.

"Waxine" Sizes.⁵⁷ Trademark for acid-stable, aqueous emulsions of various petroleum waxes, combined with rosin. Rosin is present entirely in free state (not saponified).

Use: Paper coating.

"Waxolan."⁴⁹³ Trademark for higher melting fraction of lanolin esters isolated by physical fractionation. A light tan waxy solid; anhydrous; oil miscible.

Uses: Nonionic w/o emulsifier; auxiliary emulsifier and stabilizer for o/w systems.

wax tailings. Brown, sticky, semiasphalt product obtained in the destructive distillation of petroleum tar just prior to formation of coke.

Uses: Wood preservative; roofing paper.

"WBR."¹⁸² Trademark applied to ion-exchange resin used in water treating and chemical process applications; weakly basic anion exchange resin produced from styrene and divinylbenzene.

weed-killer. See herbicide.

weight. See mass.

weighting agent. (1) In soft drink technology, an oil or oil-soluble compound of high specific gravity, such as a brominated olive oil, which is added to citrus flavoring oils to raise the specific gravity of the mixture to about 1.00, so that stable emulsions with water can be made for flavoring. (2) In the textile industry a compound used both to deluster and lower the cost of a fabric, at the same time improving its "hand" or feeling. Zinc acetylacetonate, clays, chalk, etc. are used.

"Weldal."¹⁴² Trademark for chromate-containing composition designed for preparing aluminum for resistance welding. Supplied as a yellow powder dissolved in water.

welding. A metal-joining process by which coalescence is produced by heating to suitable temperatures with or without the use of filler metal. (American Welding Society). Brazing means welding above 1000°F with a nonferrous filler metal; soldering implies use of a lower melting filler (solder) (below 1000°F) the joint depending on adhesion rather than alloying. Aluminum can be cold-welded by pressure alone. Ultrasonic welding needs no heat and only light pressure.

Werner, A. (1866–1919). A native of Switzerland, Werner was awarded the Nobel Prize for his development of the concept of the coordination theory of valence, which he advanced in 1893. His ideas revolutionized the approach to the structure of inorganic compounds and in recent years have permeated this entire area of chemistry. The term "Werner complex" has largely been replaced by "coordination compound". A noteworthy book by Dr. John Bailar (about 1945) admirably presented this important concept.

"W.E.S. Oil."¹⁷⁵ Trademark for a semi-refined coal tar distillate.

Properties: Straw to dark amber-colored liquid; distills 10% to not below 165°C; 70% to not above 190°C and 95% to not above 235°C; sp. gr. (15.5/15.5°C) 0.939–0.950; approx wt/gal 7.75 lb.

Use: High-boiling, slow-drying solvent for use in wire enamels and metal coatings.

"Westasept."²⁸⁴ Trademark for a vegetable and oil soap formulated with a high percentage of coconut oil containing 3% hexachlorophene. Used as a liquid antiseptic surgical hand soap.

Weston cell. An electrical cell used as a standard which consists of an amalgamated cadmium anode covered with crystals of cadmium sulfate dipping into a saturated solution of the salt, and a mercury cathode covered with solid mercury sulfate.

"Wetanol."⁷³ Trademark for a modified sodium lauryl sulfate.

Properties: White, practically odorless powder, pH of 1% aqueous dispersion at 25°C, 5. Soluble in water, insoluble in alcohol, hydrocarbons, mineral oil, vegetable oils.

Uses: Wetting, penetrating, scouring agent.

"Wet-Ege spirits."²⁰⁰ Trademark for a petroleum solvent prepared by straight-run distillation.

Properties: Water-white; initial boiling point 320–328°F, 95% distills between 380 and 388°F; sp. gr. 1.784 (60°F); flash point (TCC) 118°F; mild, non-residual odor; holds a wet edge longer than mineral spirits.

Hazard: Flammable, moderate fire risk.

Uses: Brushing enamels, fly sprays, polishes, cleaning garments, degreasing hides, washing metal before painting, and as a carrier for chemicals in application.

"Wetsit."¹⁰⁹ Trademark for modified, blended alkyl sulfonates.

Uses: Textile wetting agents, scouring agents, general-purpose liquid detergent bases.

wetting agent. A surface-active agent (q.v.) which, when added to water, causes it to penetrate more easily into, or to spread over the surface of, another material by reducing the surface tension of the water. Soaps and alcohols are examples. See also detergent.

WFNA. Abbreviation for white fuming nitric acid. See nitric acid, fuming.

"WGR."¹⁸² Trademark for an ion-exchange resin used in water treating and chemical processing; produced from an epoxy polymer.

whale oil (blubber oil).

Properties: Yellowish brown, nondrying, fixed oil; strong fishy odor. Soluble in alcohol, ether, benzene, chloroform, and carbon disulfide. Sp. gr. 0.925–0.939; saponification value 188–193; iodine value 120. Combustible; nontoxic.

Derivation: By boiling the blubber of whales, and skimming off the oil.

Containers: Barrels; tank cars.

Uses: Leather dressing; lubrication; tempering steel; soapmaking; fat manufacture (by hydrogenation); plant insecticide; sheep dips.

See also sperm oil (note); porpoise oil.

wheat germ oil. Light-yellow fat-soluble oil extracted from wheat germ.

Containers: 5-gal drums.

Uses: Source of Vitamin E; medicine; dietary supplement.

See also tocopherol.

whhey. The serum remaining after removal of the solids (fat and casein) from milk. Dried whey contains about 13% protein, 71% lactose, 2.3% lactic acid, 4.5% water, and 8% ash, including a low concentration of phosphoric anhydride. Besides its value as an inexpensive source of protein, whey is used as a source of lactose and lactic acid, as well as for the synthesis of riboflavin, acetone, and butyl alcohol by fermentation processes. Some types of cheese are made from whey, and it is also a possible culture medium. Dried whey may be used to replace up to 75% of the polyol component of rigid polyurethane foams. See also lactose.

whiskers. Single axially oriented crystal filaments of metals (iron, cobalt, aluminum, tungsten, rhenium, nickel, etc), refractory materials (sapphire, aluminum oxide, silicon carbide), carbon, boron, etc. They have tensile strengths of from 3 to 6 million psi and fantastically high elastic moduli. Their upper temperature limit in oxidizing atmospheres may be as high as 1700°C, and in inert atmospheres up to 2000°C. Length may be up to 2 inches, with diameter up to 10 microns. Their chief use is in the manufacture of composite structures with plastics, glass, or graphite which have many applications in the aircraft and space vehicle field, where their high heat capacity and tremendous strength are invaluable, especially as ablative agents.

whiskey.

Properties: Light yellow to amber liquid; sp. gr. 0.923–0.935 (15.56°C); 47–53% alcohol by volume. Flash point about 80°F (closed cup).

Derivation: Distillation of fermented malted grains, (corn, rye, or barley). After distillation whiskey is aged in wooden containers for several years. The characteristics of various brands and grades are due to slight "impurities," and also to the principal grain used.

Hazard: Flammable, moderate fire risk. A noncumulative poison, usually harmless in moderate amounts, but may be toxic when habitually taken in large amounts.

Containers: Wooden barrels and casks; bottles.

Uses: Beverage; medicine (stimulant; antiseptic; vasodilator). See also ethyl alcohol; proof.

white acid. A mixture of ammonium bifluoride and hydrofluoric acid used for etching glass.

Hazard: Strong irritant to skin and tissue.

Shipping regulations: (Air) Corrosive label.

white arsenic. See arsenic trioxide.

white copperas. See zinc sulfate.

white dye. An optical bleach (q.v.) or, in general, any substance, such as bluing, which may be added to a white article to increase its apparent whiteness.

white gasoline. See under gasoline.

"Whitekote."¹³⁹ Trademark for a dolomitic, normal, hydrated lime having a neutralizing value reported as 166% in terms of calcium carbonate; used in neutralizing and soil stabilization and other processes requiring an air-floated lime high in magnesium.

white lead. Name primarily applied to lead carbonate, basic (q.v.), but also used for lead sulfate, basic (white lead sulfate) and lead silicate, basic (white lead silicate).

Hazard: Toxic by ingestion and skin absorption.

Uses: Paint pigment.

white liquor. See liquor.

white metal. (1) Any of a group of alloys having relatively low melting points. They usually contain tin, lead, or antimony as the chief component. Type metal, Babbitt, pewter, and Britannia metal are of this group. (2) Copper matte containing about 75% copper, as obtained in copper smelting operations. See copper.

whitener. (1) Any of several oil-in-water emulsions in powder form that are dried and concentrated; when added to an aqueous medium they form stable emulsions, giving a white color and a cream-like body to coffee. A typical formulation contains vegetable fat, protein, sugar, corn syrup solids, plus emulsifier and stabilizers. (2) A white pigment or colorant used in the paper and textile industries.

white oil. Any of several derivatives of paraffinic hydrocarbons having moderate viscosity, low volatility and high flash point. Combustible; low toxicity. Available in U.S.P. grade.

Uses: Textile lubricant and finishing agent; plastics modifier.

white phosphorus. See phosphorus.

white precipitate. See mercury, ammoniated.

whitewash. A suspension of hydrated lime or calcium carbonate in water used for temporary antiseptic coatings of interiors of chicken houses and the like. See also calcimine.

whiting. Finely ground, naturally occurring calcium carbonate, CaCO₃, about 98% pure, contaminated with silica, iron, aluminum, or magnesium. See also calcium carbonate; chalk.

Properties: White or off-white powder; sp. gr. 2.7; in-

soluble in water, soluble in acids. It has no tinctorial power and hence is not a pigment.

Derivation: Traditionally from chalk (q.v.), obtained from England, France, Belgium. A pure limestone or calcite is the principal commercial source. Crude chalk or limestone is ground dry or wet, air- or water-floated and sieved. Grades are based on particle size, softness and light reflectance. Dry ground, air-floated limestone whiting can be as fine as 99% through 300 mesh.

Grades: Various. Paris white is the finest; coarser grades are extra gilders whiting, gilders whiting, and commercial, the last being quite coarse and of poor color. A putty grade is also sold.

Uses: Filler in rubber, plastics, and paper coatings; putty (with linseed oil); whitewashes; sealants.

willemite Zn_2SiO_4 . Natural zinc orthosilicate. Troostite is a manganese-bearing variety.

Properties: Color yellow, green, red, brown, white; luster vitreous to resinous; sometimes fluoresces in ultraviolet light; Mohs hardness 5.5; sp. gr. 3.3.

Occurrence: New Jersey; New Mexico; Africa; Greenland.

Uses: Ore of zinc; a phosphor.

Williamson synthesis. An organic method for preparing ethers by the interaction of an alkyl halide with a sodium alcoholate (or phenolate).

"Wilmar."⁴⁹⁷ Trademark for a series of fatty acids, fatty acid esters and polyesters used in foods, drugs, cosmetics, textiles, polishes, waxes and plastics.

"Wiltrol."⁵¹¹ Trademark for a series of scorch inhibitors; used in the rubber industry, e.g., nitrosodiphenylamine and surface-treated phthalic anhydride.

wine. The fermented juice of grapes or other fruits or plants. Contains from 7 to 20% alcohol (by volume). The higher percentages are obtained by addition of pure alcohol (fortifying). Coloring matter, sugars, and small amounts of acetic acid, salts, higher fatty acids, etc. give wines their distinctive appearance and flavor. Low toxicity.

Hazard: Flammable; moderate fire risk.

wine ether. See ethyl pelargonate.

wine gallon. Same as U.S. gallon.

wine lees. A deposit or sediment formed in the bottom of wine casks during fermentation. Wine lees vary greatly in quality, but usually contain from 20–35% potassium acid tartrate and up to 20% calcium tartrate. They also contain yeast cells, proteins, and other solid matter which was suspended in the grape juice.

Use: Source of tartaric acid and tartrates.

"Wing-Stay."²⁶⁴ Trademark for a series of para-phenylenediamine derivatives used as stabilizers, antioxidants and antiozonants for natural and synthetic rubbers and latices.

"Wing-Stop."²⁶⁵ Trademark for sodium dimethyldithiocarbamate used in terminating the polymerization reactions of SBR elastomers, in "hot" and "cold" reactions.

wintergreen oil. See methyl salicylate.

winterize. A process of refrigerating edible and lubricating oils to crystallize the saturated glycerides, which are then removed by filter pressing.

"Witall."¹⁰⁴ Trademark for a series of driers manufactured from highly refined tall oil acids available in

usual metallic salts including cobalt, lead and manganese. Equals naphthenate driers in action.

"Witcarb."¹⁰⁴ Trademark for a series of finely precipitated calcium carbonates.

"Witcizer."¹⁰⁴ Trademark for plasticizers used in the plastics, paint and lacquer industries.

"Witcoblak."¹⁰⁴ Trademark for pigment carbon blacks. Suitable for use in inks, paints, plastics, paper, caulking compounds, etc.

"Witcogard."¹⁰⁴ Trademark for a coating system used to protect new and used guardrails. A 2-component system, the base is a bituminous adhesive consisting of refined asphalts, petroleum resins, plasticizers, asbestos, mica, wetting agent, copolymer and petroleum solvent. The second component is colored ceramic granules which are opaque and self-cleaning.

witherite BaCO_3 . A natural barium carbonate usually found in veins with lead ores.

Properties: White, yellowish or grayish. Vitreous, inclining to resinous luster. Sp. gr. 4.27–4.35; Mohs hardness 3–3.75.

Occurrence: United States (Kentucky, Lake Superior region), England (most important source).

Hazard: Toxic by ingestion; skin irritant.

Uses: Chemicals (barium dioxide, barium hydroxide, blanc fixe); plate glass and porcelain; brick making; rodenticide.

"Wittox."¹⁰⁴ Trademark for copper and zinc naphthenate fungicides.

Wöhler, Friedrich (1800–1882). A native of Germany. Wöhler, working with Berzelius, placed the qualitative analysis of minerals on a firm foundation. In the early 19th century chemists still thought it impossible to synthesize organic compounds. In 1828, Wöhler publicized his laboratory synthesis of urea, which he had obtained four years previously by heating the inorganic substance ammonium cyanate; the synthesis is a result of intramolecular rearrangement:

This was the beginning of the science of synthetic organic chemistry.

Wohlwill process. The official process of the U.S. mints for refining gold. It consists in subjecting gold anodes to electrolysis in a hot solution of hydrochloric acid containing gold chloride, the solution being continuously agitated with compressed air.

wolfram. See tungsten. Wolfram is the official international alternate name for tungsten. The latter is preferred in the U.S.

wolframic acid, anhydrous. See tungstic oxide.

wolframite $(\text{Fe}, \text{Mn})\text{WO}_4$. A natural tungstate of iron and manganese. Ferberite is the iron-rich member of the series, and huebnerite is the manganese-rich member.

Properties: Color black to brown; luster sub-metallic to resinous; streak black to brown; Mohs hardness 5–5.5; sp. gr. 7.0–7.5.

Occurrence: Colorado, South Dakota, Nevada, Australia, Bolivia, Europe.

Use: Chief ore of tungsten.

wolfram white. See barium tungstate.

wollastonite CaSiO_3 . A natural calcium silicate, found in metamorphic rocks.

Properties: Color white to brown, red, gray, yellow; luster vitreous to pearly; Mohs hardness 4.5–5; sp. gr. 2.8–2.9.

Occurrence: New York; California.

Grades: Fine, medium paint grades.

Uses: Ceramics; paint extender; welding rod coatings; rubber filler; silica gels; paper coating; filler in plastics, cements, and wallboard; mineral wool; soil conditioner.

"Wolman."¹¹ Trademark for a wood preservative comprising a mixture of chlorinated arsenate, fluoride and phenolic salts used in aqueous solutions to impregnate lumber to protect it against decay and termites.

wood. Wood is composed principally of 40–60% cellulose and 20–40% lignin, together with gums, resins, a variable amount of water, and potassium compounds. Its fuel value varies widely around 3000–6000 Btu per lb according to variety, moisture, etc. Combustible.

Uses: Pulp and paper; construction; packaging and cooperage; furniture; destructive distillation products (charcoal); extraction products (turpentine, rosin, tall oil, pine oil, etc.); methyl alcohol; plywood; fuel; rayon and cellophane; flock.

wood alcohol. See methyl alcohol.

wood ash. The inorganic residue of wood combustion.

Use: Fertilizer for its potash content, which averages around 4% K_2O .

wood flour (wood flock). Pulverized dried wood from either soft or hardwood wastes. Graded according to color and fineness.

Grades: Domestic standard, domestic fine, imported 40–60 mesh, 70–80 mesh, etc.

Hazard: Flammable; dangerous fire risk, especially suspended in air.

Uses: Manufacture of dynamite; filler for plastics, rubber, paperboard; fur cleaning; polishing agents; Sorel cement.

wood, indurated. A wood hardened by impregnation with a phenol-formaldehyde product. Used in storage batteries.

wood, petrified. Wood in which the original chemical components have been replaced by silica. The change occurs in such a way that the original form and structure of the wood are preserved. The most famous instance is the Petrified Forest of Arizona.

wood pulp. See pulp, paper.

wood rosin. See rosin.

Wood's metal. A four-component fusible alloy used largely in sprinkler systems; it melts at 70°C, the composition being bismuth 50%, cadmium 10%, tin 13.3%, lead 26.7%. See also alloy, fusible; eutectic.

wood sugar. See D(+)-xylose.

wood tar. See pine tar; creosote, wood-tar.

wood turpentine. See turpentine (oil).

wool. Staple fibers, usually 2–8 in. long, obtained from the fleece of sheep (and also alpaca, vicuna, and certain goats). Physically, wool differs from hair in fineness and by the presence of prominent cortical scales and a natural crimp. The latter properties are

responsible for the felting properties of wool and the ability of the fibers to cling together when spun into yarns. Chemically, wool consists essentially of protein chains (keratin) bound together by disulfide cross linkages.

Properties: Tenacity ranges from 1 to 2 g per denier; elongation 25–50%; sp. gr. 1.32; moisture regain 16% (70°F, 65% relative humidity); decomposes about 260°F, scorches at 400°F. Resistant to most acids except hot sulfuric; destroyed by alkalis and chlorine bleach; resistant to mildew but attacked by insects. Combustible. Amphoteric to dyes.

Sources: Australia, Argentina, U.S., New Zealand, Uruguay, U.S.S.R., England.

Uses: Outerwear; blankets; carpets; upholstery; felt; clothing; source of lanolin.

For additional information refer to Wool Bureau, 360 Lexington Ave., N.Y.

wool fat. See lanolin.

wool waste. Wool from scrap materials cut up for remaking into cloth. Used as a fertilizer. Wool waste usually contains from 4–7% ammonia. Pure wool shoddy may contain as much as 15% nitrogen and is particularly valued by hop growers.

Hazard: Wet wool waste is flammable and a dangerous fire risk.

Shipping regulations: (Wet) (Rail) Yellow label. Not accepted by express.

wort. A clear infusion of grain extract (usually malt) used as the basis of fermentation in the brewing industry. See also brewing.

"Worthite."²⁶⁹ Trademark for an austenitic stainless steel, containing 3% silicon, 20% chromium, 24% nickel, 2.75% molybdenum, 1.75% copper. Available in castings and wrought bars.

Uses: Pumps for corrosive environments, (paper industry, citrus fruit canners, sea water, sulfuric acid plants, etc.).

writing ink. A solution of colorant in water, usually containing also low percentages of tannic or gallic acid. Washable inks contain glycerol. Various water-soluble dyes are used for colored inks; dispersions of carbon black stabilized with a protective colloid are used for drawing inks. Fountain pen inks retain the fluidity of water; for ball-point pens the mixture is of a paste-like consistency.

wrought iron. A ferrous material, aggregated from a solidifying mass of pasty particles of highly refined metallic iron into which from 1 to 4% of slag is uniformly dispersed without subsequent melting. Wrought iron is distinguished by its low carbon and manganese contents. Carbon seldom exceeds 0.035%, and manganese content is held at 0.06% max. Phosphorus usually ranges from 0.10% to 0.15%; it adds about 1000 psi for each 0.01% above 0.10%. Sulfur content is normally low, ranging from 0.006% to below 0.015%. Silicon content ranges from 0.075% to 0.15%; silicon content of base metals is 0.015% or less. Residuals such as Cr, Ni, Co, Cu and Mo are generally low, totaling less than 0.05%.

Wrought iron is readily fabricated by standard methods and is quite corrosion-resistant.

wulfenite PbMoO_4 , sometimes with Ca, Cr, V. Yellow, orange or bright orange-red mineral of resinous

luster. Found in veins with ores of lead. Sp. gr. 6.7–7.0; Mohs hardness 2.75–3.

Occurrence: United States (Massachusetts, New York, Pennsylvania, Nevada, Utah, New Mexico, Arizona); Europe; Australia.

Uses: Ore of molybdenum.

Wulff process. A process for producing acetylene by treating a hydrocarbon gas such as butane with superheated steam in a regenerative type of refractory furnace at 2100–2500°F. Contact times are very short. Acetylene and ethylene are produced in 1 to 1 ratio; used for vinyl chloride. See also acetylene.

X

xanthan gum. A synthetic biopolymer made by fermentation of carbohydrates; it is a thickening and suspending agent that is heat-stable, with good tolerance for strongly acid and basic solutions. A relatively new product, its expected uses are in drilling fluids, ore flotation and the food and pharmaceutical fields, especially in prepared mixes and high-protein fast foods. Viscosity remains stable over wide temperature range.

xanthate. A salt (usually potassium or sodium) of a xanthic acid (q.v.). Available as yellow pelletized solids having a pungent odor; soluble in water. Examples are potassium amyl xanthate, potassium ethyl xanthate, sodium isobutyl xanthate, sodium isopropyl xanthate. See also cellulose xanthate; viscose process.

Use: Collector agents in the flotation of sulfide minerals, metallic elements such as copper, silver, and gold, and some oxidized minerals of lead and copper.

xanthene (dibenzopyran, tricyclic). $\text{CH}_2(\text{C}_6\text{H}_4)_2\text{O}$. The central structure of the fluoroscein, eosin and rhodamine dyes.

Properties: Yellowish, crystalline leaflets. M.p. 100.5°C ; b.p. 315°C . Soluble in ether; slightly soluble in alcohol; very slightly soluble in water.

Derivation: By the condensation of phenol and orthocresol by means of aluminum chloride.

Uses: Organic synthesis; fungicide.

xanthene dye. A group of dyes whose molecular structure is related to that of xanthene. The aromatic (C_6H_4) groups constitute the chromophore. Colour Index number ranges from 45000 to 45999. The dyes are closely related structurally to diaryl methane dyes. Eosin (CI No. 45380) is an example.

xanthenol. See xanthidrol.

xanthic acid (xanthogenic acid). A substituted dithiocarbonic acid of the type $\text{ROC}(\text{S})\text{SH}$, in which R is ordinarily an alkyl radical. Unless otherwise designated, xanthic acid is understood to be the ethyl derivative, also called ethylxanthic acid, $\text{C}_2\text{H}_5\text{OC}(\text{S})\text{SH}$, a liquid melting at -53°C and decomposing at room temperature. Xanthic acid salts are called xanthates (q.v.).

xanthine (dioxopurine) $\text{C}_5\text{H}_4\text{N}_4\text{O}_2$. A purine base occurring in the blood and urine and in some plants. Theophylline and theobromine, the alkaloids of tea and cocoa, respectively, are both dimethylxanthines; caffeine, in coffee, is a trimethylxanthine.

Properties: Yellowish white powder; sublimes with partial decomposition. Soluble in potassium hydroxide; insoluble in water and acid.

Derivation: By the action of nitrous acid on guanine.

Grades: Technical, C.P.; monohydrate; sodium salt. Radioactive forms available.

Hazard: Moderately toxic by ingestion.

Uses: Organic synthesis; medicine.

xanthine oxidase. An enzyme found in animal tissues which acts upon hypoxanthine, xanthine, aldehydes,

reduced coenzyme I, etc., producing, respectively, xanthine, uric acid, acids, oxidized coenzyme I, etc. Use: Biochemical research.

xanthogenic acid. See xanthic acid.

xanthone (benzophenone oxide, dibenzopyrone, xanthene ketone) $\text{CO}(\text{C}_6\text{H}_4)_2\text{O}$. Tricyclic. Occurs in some plant pigments.

Properties: White needles or crystalline powder; m.p. $173-4^\circ\text{C}$; b.p. 350°C ; sublimes. Insoluble in water, soluble in alcohol, chloroform, and benzene, especially when hot.

Uses: Larvicide; intermediate for dyes, perfumes and pharmaceuticals.

xanthophyll $\text{C}_{40}\text{H}_{56}\text{O}_2$.

Properties: Yellow pigment; an oxygenated carotenoid occurring in green vegetation and in some animal products, notably egg yolk. M.p. $190-3^\circ\text{C}$; insoluble in water, slightly soluble in alcohol and ether.

See also lutein; carotenoid.

xanthopterin $\text{C}_6\text{H}_5\text{N}_3\text{O}_2 \cdot \text{H}_2\text{O}$. 2-Amino-4,6-dihydroxypteridine. Pigment found in the wings of butterflies. Can be converted by yeast into folic acid.

Properties: Orange-yellow crystals; sinters around 360°C ; decomposes above 410°C . Practically insoluble in water; freely soluble in dilute ammonium or sodium hydroxide giving yellow solutions, and in 2N hydrochloric acid giving colorless solutions.

Use: Biochemical research.

xanthidrol (xanthenol) $\text{HCOH}(\text{C}_6\text{H}_4)_2\text{O}$. A derivative of xanthene.

Properties: White powder; m.p. 123°C . Insoluble in water; soluble in alcohol.

Derivation: Reduction of xanthone with alcohol and sodium.

Grades: C.P. (analytical).

Use: Determination of urea and DDT.

"X-Cor."²³⁶ Trademark for an ethoxylated diamine liquid. Added to drilling and packer fluids to protect drill pipe, casing and tubing from hydrogen sulfide attack, oxidation or the corrosive effects of electrolytes. Chemically stable, nonfluorescing; does not adversely affect drilling mud properties. Not affected by calcium or chloride contaminants; effective over a wide range of pH and temperature.

Xe Symbol for xenon.

xenon Xe Element of atomic number 54; noble gas group of the periodic table. Atomic weight 131.30. Valences 2, 4, 6, 8. There are 9 stable isotopes.

Properties: Colorless, odorless gas or liquid. Gas (at STP) has density of 5.8971 g/l and dielectric constant (25°C), 1 atm) of 1.0012. Liquid has b.p. of -108.12°C at 1 mm; density (at b.p.) 2.987 g/cc. Liquefaction temp. -106.9°C . Noncombustible; non-toxic. Chemically unreactive, but not completely inert.

Derivation: Fractional distillation of liquid air.

Containers: Hermetically sealed glass flasks; pressurized steel cylinders.

Uses: Luminescent tubes; flash lamps in photography; fluorimetry; lasers; tracer studies; anesthesia.

Shipping regulations: (Air) Nonflammable Gas label. See also noble gas; xenon compounds.

xenon compounds.

Xenon tetrafluoride, XeF_4 , is easily prepared by mixing fluorine and xenon in gaseous form, heating in a nickel vessel to 400°C , and cooling. The product forms large colorless crystals. The difluoride and hexafluoride, XeF_2 and XeF_6 , also colorless crystals, can be obtained somewhat similarly. The hexafluoride melts to a yellow liquid at 50°C and boils at 75°C . Many XeF complexes with other compounds are also known. Xenon oxytetrafluoride, XeOF_4 , a volatile liquid at room temperature, is obtained from the reaction of xenon hexafluoride and silica. Gram amounts have been isolated and studied.

All these fluorides must be protected from moisture to avoid formation of xenon trioxide, XeO_3 , a colorless, nonvolatile solid which is dangerously explosive when dry. Its solution, the so-called *xenic acid*, is a *stable weak acid but a strong oxidizing agent*, which will even liberate chlorine from hydrochloric acid.

In an alkaline solution, xenon trioxide reacts to give free xenon and a perxenate, such as $\text{Na}_4\text{XeO}_6 \cdot 8\text{H}_2\text{O}$. Perxenates are probably the most powerful oxidizing agents known, just as the xenon fluorides are extremely effective fluorinating agents.

Complex compounds containing nitrogen bonded to xenon have also been prepared.

Hazard: Highly toxic by inhalation; oxidizing agents; strong irritants.

xenyl. The biphenyl group, $\text{C}_6\text{H}_5\text{C}_6\text{H}_4-$.

xerography. A "dry" method of photography or photocopying. A metal plate is covered with a layer of photoconductive powder, such as selenium; the surface of this plate is given an electric charge by passing it under a series of charged wires. An image of the material to be photographed is projected onto the charged plate through a camera lens. The electric charges disappear in the areas exposed to light, but elsewhere the surface retains its charge. A powder consisting of a coarse carrier and a fine developing resin is then spread over the plate. Adhesion between powder and plate occurs only at the charged areas. Elsewhere developing resin and carrier are not retained on the plate, which thus has become a negative of the original image. A positive is obtained by placing a piece of paper against the plate, and applying an electric charge as in the first stage of the process. This causes adhesion of developing resin and its carrier to the paper. This positive print is fixed by heating in a press for a few seconds to melt the developing resin and fuse it to the paper. Colored prints are possible by use of suitable developing resins. Various materials other than paper can be printed.

XLPE. Trade abbreviation for cross-linked polyethylene (q.v.).

x-radiation (rotengen rays; x-rays). Electromagnetic radiation of extremely short wavelength (0.06 to 120 Å), emitted as the result of electron transitions in the inner orbits of heavy atoms bombarded by cathode rays in a vacuum tube. Those of the shortest wavelength have the highest intensity, and are called "hard" x-rays. X-radiation was discovered by Roent-

gen in 1898. Its properties are: (1) Penetration of solids of moderate density, such as human tissue; they are retarded by bone, barium sulfate, lead, and other dense materials. (2) Action on photographic plates and fluorescent screens. (3) Ionization of the gases through which they pass. (4) Ability to damage or destroy diseased tissue; there is also a cumulative deleterious effect on healthy tissue.

Hazard: Overexposure can permanently damage cells and tissue structures; effect is cumulative.

Uses: Spectrometry; structure determination of molecules; cancer therapy; diagnostic medicine; nondestructive testing of metals; identification of original paintings.

See also radiation, ionizing; diffraction, x-ray; Roentgen.

xylene (dimethylbenzene) $\text{C}_6\text{H}_4(\text{CH}_3)_2$. A commercial mixture of the three isomers, ortho-, meta-, and para-xylene. The last two predominate.

Properties: Clear liquid; soluble in alcohol and ether; insoluble in water. Sp. gr. approximately 0.86; see under Grades for boiling range. Flash point from 81 to 115°F (TOC).

Derivation: (a) Fractional distillation from petroleum (90%), coal tar or coal gas; (b) by catalytic reforming from petroleum, followed by separation of para-xylene by continuous crystallization; (c) from toluene by transalkylation (q.v.).

Grades: Nitration (b.p. range 137.2 – 140.5°C); 3° (b.p. range 138 – 141°C); 5° (b.p. range 137 – 142°C , high in meta isomer); 10° (b.p. range 135 – 145°C); industrial (b.p. 90% below 150°C , complete below 160°C). Also other grades depending upon use. In some cases one or another of the industrial isomers are partially removed for use in chemical production.

Containers: Glass bottles, 5-, 55-, 110-gal drums; tank cars, tank trucks.

Hazard: Flammable, moderate fire risk; toxic by ingestion and inhalation. Tolerance 100 ppm in air.

Uses: Aviation gasoline; protective coatings; solvent for alkyd resins, lacquers, enamels, rubber cements; synthesis of organic chemicals.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

See also following entries.

meta-xylene (1,3-dimethylbenzene) $1,3\text{-C}_6\text{H}_4(\text{CH}_3)_2$.

Properties: Clear, colorless liquid, soluble in alcohol and ether; insoluble in water. Sp. gr. (15°C) 0.8684; f.p. -47.4°C ; b.p. 138.8°C ; refractive index (20°C) 1.4973. Flash point 85°F . Autoignition temp. 982°F .

Derivation: Selective crystallization or solvent extraction of meta-para mixtures.

Grades: 95% (technical); 99%; 99.9% (research).

Hazard: Flammable, moderate fire risk.

Uses: Solvent; intermediate for dyes and organic synthesis, especially isophthalic acid; insecticides; aviation fuel.

ortho-xylene (1,2-dimethylbenzene) $1,2\text{-C}_6\text{H}_4(\text{CH}_3)_2$.

Properties: Clear, colorless liquid; soluble in alcohol and ether; insoluble in water. Sp. gr. ($20/4^\circ\text{C}$) 0.880; f.p. -25°C ; b.p. 144°C ; refractive index (20°C) 1.505. Flash point 115°F (TOC). Autoignition temp. 867°F . Combustible.

Grades: 99%, free of hydrogen sulfide and sulfur dioxide; technical 95%; research 99.9%.

Hazard: Moderate fire risk.

Uses: Manufacture of phthalic anhydride; vitamin and pharmaceutical syntheses; dyes; insecticides; motor fuels.

para-xylene (1,4-dimethylbenzene) $\text{1,4-C}_6\text{H}_4(\text{CH}_3)_2$.

Properties: Colorless liquid; crystals at low temperature; soluble in alcohol and ether; insoluble in water. Sp. gr. (20°C) 0.8611; m.p. 13.2°C; b.p. 138.5°C; refractive index (21°C) 1.5004. Flash point 81°F (TOC).

Derivation: Selective crystallization or solvent extraction of meta-para mixtures; separation from mixed-xylene feedstocks by adsorption (Parex process⁴¹⁶).

Hazard: Flammable, dangerous fire risk.

Uses: Synthesis of terephthalic acid for polyester resins and fibers ("Dacron," "Mylar," "Terylene"); vitamin and pharmaceutical syntheses; insecticides.

Shipping regulations: See xylene.

para-xylene-alpha,alpha'-diol $\text{C}_6\text{H}_4(\text{CH}_2\text{OH})_2$.

Properties: White crystalline solid. M.p. 118°C; b.p. 138–144°C (0.8–1.0 mm). Slightly soluble in water (25°C).

Purity: Approximately 98%.

Uses: Polyester resins.

xynol (dimethylphenol, hydroxydimethylbenzene; dimethylhydroxybenzene) $(\text{CH}_3)_2\text{C}_6\text{H}_3\text{OH}$. There are five isomers (2,4-; 2,5-; 2,6-; 3,4-; 3,5-). This entry describes commercially offered mixtures.

Properties: White, crystalline solid; sp. gr. (15°C) 1.02–1.03; m.p. 20–76°C; b.p. 203–225°C. Only slightly soluble in water, soluble in most organic solvents and in caustic soda solution. Combustible.

Derivation: Cresylic acid or tar acid fraction of coal tar.

Containers: Fiber drums.

Hazard: Toxic by ingestion and skin absorption.

Uses: Disinfectants; solvents, pharmaceuticals, insecticides and fungicides; plasticizers; rubber chemicals; additives to lubricants and gasolines; manufacture of polyphenylene oxide (2,6-isomer only); wetting agents; dyestuffs.

"Xylex 780."²⁷⁷ Trademark for a chemical peptizing agent or softener to facilitate processing of rubbers; reclaiming natural and/or synthetic rubbers.

Containers: Up to tank cars.

xylidine (aminodimethylbenzene; aminoxylene; dimethylaniline) $(\text{CH}_3)_2\text{C}_6\text{H}_3\text{NH}_2$. A varying mixture of isomers (2,3-; 2,4-; 2,5-; 2,6-).

Properties: Liquid; sp. gr. 0.97–0.99; b.p. 213–226°C; slightly soluble in water; soluble in alcohol and ether. Flash point 206°F (C.C.). Combustible.

Derivation: Nitration of xylene and subsequent reduction.

Containers: 425- and 800-lb drums; tank cars.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Tolerance, 5 ppm in air.

Uses: Dye intermediates; organic syntheses; pharmaceuticals.

Shipping regulations: (Air) Poison label.

D(+)-xylose (wood sugar) $\text{C}_5\text{H}_{10}\text{O}_5$. (not to be confused with phenylsazone of the same name.)

Properties: White crystalline dextrorotatory powder, sweet taste; sp. gr. (20°C) 1.525; m.p. 144°C (also given as 153°C); soluble in water and alcohol. Non-toxic; combustible.

Derivation: Hydrolysis with hot dilute acids of wood, straw, corn cobs, etc.; wood pulp wastes.

Grades: Reagent, technical.

Uses: Dyeing; tanning; diabetic food; nonnutritive sweetener.

xylol bromide (alpha-bromoxylene) $\text{CH}_3\text{C}_6\text{H}_4\text{CH}_2\text{Br}$. Mixed ortho-, meta-, and para-isomers.

Properties: Colorless liquid; pleasant aromatic odor. Decomposed slowly by water. Sp. gr. 1.4; b.p. 210–220°C. Combustible.

Derivation: Bromination of xylene.

Grade: Technical.

Containers: Lead-lined drums.

Hazard: Highly toxic by inhalation, and ingestion; strong irritant to eyes, skin, and tissue.

Uses: Organic synthesis; tear gas.

Shipping regulations: (Rail) Tear Gas label. (Air) Poison label. Not acceptable on passenger planes.

m-xylol chloride $\text{CH}_3\text{C}_6\text{H}_4\text{CH}_2\text{Cl}$.

Properties: Colorless liquid; b.p. 196°C; sp. gr. 1.064. Combustible.

Hazard: Toxic by ingestion and inhalation. Strong irritant to eyes and skin.

Use: Intermediate.

para-xylene $\text{CH}_2\text{:C}_6\text{H}_4\text{:CH}_2$. A monomer. See parylene.

Y

Y Symbol for yttrium.

"Yarmor."²⁶⁶ Trademark for series of pine oils for widely varied uses. Total terpene alcohol contents from 55% up to 91%.

Uses: Disinfectants, textile specialties, wetting and flotation agents, special solvents, household and industrial cleaners; odorants.

Yb Symbol for ytterbium.

yeast (barm). Unicellular organisms known as saccharomycetaceae. The following description applies to the cultured commercial product, and not to various wild varieties.

Properties: Yellowish-white viscid liquid or soft mass, flakes, or granules, consisting of cells and spores of *Saccharomyces cerevisiae*. Nontoxic.

Derivation: A ferment obtained in brewing. Yeasts induce fermentation by enzymes (zymases) which convert glucose and other carbohydrates into carbon dioxide and water in the presence of oxygen, or into alcohol and carbon dioxide (or lactic acid) in the absence of oxygen.

Grades: Technical; brewers'; cooking; compressed (contains about 74% moisture); dried; N.F. (contains no starch or filler, not more than 7% moisture nor more than 8% ash). Also graded according to vitamin B₁ content.

Containers: Tins, boxes, drums, tank trucks.

Uses: Fermentation of sugars, molasses, and cereals for alcohol; brewing; medicine; baking; food supplement; protein biosynthesis from many carbonaceous and nitrogenous materials, including petroleum; source of vitamins, enzymes, nucleic acids, etc.; biochemical research.

See also bacteria; fermentation.

yeast adenylic acid. See adenylic acid.

yellow AB (1-(phenylazo)-2-naphthylamine)

$C_6H_5N_2C_{10}H_6NH_2$. Colour Index No. 11380.

Properties: Orange or red platelets; m.p. 102-104°C; insoluble in water; soluble in alcohol and oils.

Hazard: Consult regulations before using in food products.

Use: Biological stain.

yellow brass. A brass containing from 34 to 37% zinc; it has excellent fabrication properties and corrosion resistance. Used for structural and decorative purposes. See also brass.

yellow enzyme. See flavin enzyme.

yellow gentian. See gentian.

yellow glass. A soda-lime glass.

yellow lake. Any of several pigments made by precipitating soluble yellow dyes on an aluminum hydrate base. They are transparent in oil and lacquer vehicles and are used for metal decorating.

yellow OB (1-ortho-tolueneazonaphthylamine-2)

$CH_3C_6H_4N_2C_{10}H_6NH_2$. Colour Index No. 11390.

Properties: Orange or yellow powder; m.p. 122-125°C; insoluble in water; soluble in alcohol and oils.

Hazard: Consult regulations before using in food products.

Use: Biological stain.

yellow phosphorus. See phosphorus.

yellow precipitate. See mercuric oxide, yellow.

yellow prussiate of potash. See potassium ferrocyanide.

yellow prussiate of soda. See sodium ferrocyanide.

yellow salt. See uranyl nitrate.

ylang ylang oil. An essential yellowish volatile oil distilled from the flowers of *Cananga odorata*, the principal sources of which are the Philippines and Réunion (Bourbon variety). It is often confused with cananga oil. The major components are linalool, geraniol and their esters, pinene, with small amounts of para-cresol methyl ether, and various other substances. Nontoxic.

Properties: (Manila) Sp. gr. 0.911-0.958 (30/4°C); optical rotation -27 to -49° 7' (mostly -32 to -45°); refractive index 1.4747-1.4940 (rarely over 1.4900); ester value 90-150 (usually 100 or more). This is the first fraction to distill over. Later fractions are sometimes called cananga oil.

(Réunion) Sp gr. 0.932-0.962 (15°C); optical rotation -34 to -64°; ester value 96-134.

Containers: Bottles.

Uses: Perfumery; flavoring.

ylem. The original substance from which atoms are believed to have been derived, thought to have consisted of neutrons and electromagnetic radiation. According to one theory, most of the elements were formed in only a few minutes' time. See also element; abundance.

ylid. A substance in which a carbanion (q.v.) is attached to a heteroatom with a high degree of positive charge, i.e., $>C^--X^+$. It is similar to a zwitterion and related to the Wittig reaction.

yohimbine (aphrodine; corynine; quebrachine)

$C_{21}H_{26}O_3N_2$.

Properties: Glistening, needle-like alkaloid; m.p. 234°C; soluble in alcohol and ether; very slightly soluble in water.

Derivation: By extraction from the bark of *Corynanthe yohimbe*, found in the Cameroons.

Hazard: Toxic by ingestion.

Young's modulus. See modulus of elasticity.

ytterbium Yb A rare-earth metal (q.v.) of yttrium subgroup; atomic number 70; atomic weight 173.04; valence 2,3. Exists in alpha and beta forms, the lat-

ter being semiconductive at pressures above 16,000 atm. There are 7 natural isotopes.

Properties: Metallic luster; quite malleable; m.p. 824°C; b.p. 1427°C; sp. gr. 7.01; reacts slowly with water; soluble in dilute acids and liquid ammonia. Low toxicity.

Source: See rare earth metals.

Derivation: Reduction of the oxide with lanthanum or misch metal.

Grades: Regular high purity (ingots and lumps).

Uses: Lasers; dopant for garnets; portable x-ray source; chemical research.

ytterbium chloride $\text{YbCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Green crystals; sp. gr. 2.575; loses $6\text{H}_2\text{O}$ at 180°C; m.p. 865°C; very soluble in water; hygroscopic.

ytterbium fluoride YbF_3 .

Properties: Solid; m.p. 1157°C; b.p. 2200°C; insoluble in water; hygroscopic.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

ytterbium oxide (ytterbia) Yb_2O_3 .

Properties: Colorless mass when free of thulia but tinted brown or yellow when containing thulia. The weakest base of the yttrium group with the exception of scandia and lutetia. Slightly hygroscopic, absorbs water and carbon dioxide from the air; sp. gr. 9.2; melting point 2346°C. Soluble in hot, dilute acids, less so in cold acids.

Containers: Glass bottles.

Uses: Special alloys; dielectric ceramics; carbon rods for industrial lighting; catalyst; special glasses.

ytterbium sulfate $\text{Yb}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Crystalline solid; sp. gr. 3.286; soluble in water.

yttria. See yttrium oxide.

yttrium Y Element of atomic number 39, group IIIB of the periodic table. Atomic weight 88.9059. Valence 3. No stable isotopes.

Properties: Dark gray metal; sp. gr. 4.47; m.p. 1500°C; b.p. 2927°C. Soluble in dilute acids and potassium hydroxide solution; decomposes water; known only in the tripositive state; low neutron capture cross-section.

Source: See rare-earth metals.

Derivation: Reduction of the fluoride with calcium.

Grades: Regular high purity (ingots, lumps, turnings); metallurgical; low-oxygen; crystal sponge; powder.

Containers: Wooden kegs or fiber drums.

Hazard: Tolerance, 1 mg per cubic meter in air. Flammable in finely divided form.

Uses: Nuclear technology; iron and other alloys; incandescent gas mantles; deoxidizer for vanadium and other nonferrous metals; microwave ferrites; coating on high-temperature alloys; special semiconductors.

yttrium acetate $\text{Y}(\text{C}_2\text{H}_3\text{O}_2)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water.

Derivation: Action of acetic acid on yttrium oxide.

Use: Analytical chemistry.

yttrium antimonide YSb . A high-purity binary semiconductor.

yttrium arsenide YAs . A high-purity binary semiconductor.

Hazard: Highly toxic.

yttrium bromide $\text{YBr}_3 \cdot 9\text{H}_2\text{O}$.

Properties: Colorless crystals. Hygroscopic. M.p. (anhydrous) 904°C. Soluble in water; slightly soluble in alcohol; insoluble in ether.

yttrium chloride $\text{YCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Reddish white, transparent, deliquescent prisms. Soluble in water and alcohol; insoluble in ether. Sp. gr. 2.18; decomposes at 100°C.

Derivation: By the action of hydrochloric acid on yttrium oxide.

Grades: Purities to 99%.

Use: Analytical chemistry.

yttrium oxide (yttria) Y_2O_3 .

Properties: Yellowish-white powder. Soluble in dilute acids; insoluble in water. Sp. gr. 4.84; m.p. 2410°C.

Derivation: By the ignition of yttrium nitrate.

Grades: Purities to 99.8%; electronic grade 99.999%.

Containers: Wooden kegs or fiber drums.

Uses: Phosphors for color TV tubes (alloy with europium); yttrium-iron garnets for microwave filters; stabilizer for zirconia refractories.

yttrium phosphide YP . Used as a high-purity binary semiconductor.

yttrium sulfate $\text{Y}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Small reddish-white, monosymmetric crystals. Soluble in concentrated sulfuric acid; sparingly soluble in water; insoluble in alkalis. Sp. gr. 2.558; loses $8\text{H}_2\text{O}$ at 120°C; decomposes 700°C.

Derivation: Action of sulfuric acid on monazite sand.

Method of purification: Fractional crystallization.

Use: Reagent.

yttrium vanadate YVO_4 .

Properties: White crystalline solid.

Use: With europium vanadate as red phosphor in color television tubes.

Z

"Zaclon."²⁸ Trademark for a series of fluxes based on active zinc ammonium chloride combined with additives; available in various forms.

"Zactane" Citrate.²⁴ Trademark for ethoheptazine citrate.

"Zalba."²⁸ Trademark for a rubber antioxidant containing a hindered phenol. Yellow cream-colored powder; sp. gr. 1.30.

Uses: Nondiscoloring antioxidant for natural and synthetic rubbers and latex. Stabilizer in SBR manufacture.

"Zamak."²⁶⁸ Trademark for zinc die-casting alloys.

Zanzibar gum. A hard, usually fossil type of copal.

Source: Found on the island of Zanzibar and the adjacent African mainland.

Properties: Sp. gr. 1.062-1.068; m.p. 240-250°C; insoluble in most solvents. Combustible.

Use: Varnishes.

"Zarontin."³³⁰ Trademark for ethosuximide (q.v.).

"Z-B-X."²⁴⁸ Trademark for zinc butylxanthate (q.v.).

ZDP. Abbreviation for zinc dithiophosphate.

"Zectran."²³³ Trademark for insecticides containing 4-dimethylamino-3,5-xylyl N-methylcarbamate.

"Zeecon."⁴⁸ Trademark for sodium lignin sulfonate with controlled wood sugar content. Used as a cement dispersant in the manufacture of concrete.

"Zee-Mill."⁴⁸ Trademark for a lignin base grinding aid for Portland cement.

"Zefkrome."⁵⁶⁵ Trademark for acrylic fiber; available in brilliant shades which are colorfast, uniform, and consistent.

"Zefran."⁵⁶⁵ Trademark for an acrylic fiber in white staple form, based on polyacrylonitrile and supplemented with a dye-receptive component. Has higher strength than other acrylics and different dyeing properties.

zein. The protein of corn.

Properties: White to slightly yellow powder. Odorless, nontoxic protein of the prolamine class, derived from corn. Contains 17 amino acids. Tasteless. Free of cystine, lysine, and tryptophan. A resinous material dispersible in water with neutral sulfonated castor oil. Soluble in dilute alcohol; insoluble in water, dilute acids, anhydrous alcohols, turpentine, esters, oils, fats. Sp. gr. 1.226. Combustible.

Derivation: By-product of corn processing, by extraction of gluten meal with 85% isopropyl alcohol, extraction of the zein from the extract with hexane, precipitation by water, and spray drying.

Containers: Bags; carloads; truckloads.

Uses: Paper coating; grease-resistant coating; label varnishes; laminated board; solid color prints; printing inks; food coatings; microencapsulation; fibers.

"Zelan."²⁸ Trademark for a line of durable water-repellent textile finishes.

"Zelcon" SL.²⁸ Trademark for a quaternized long-chain complex amine condensation product used as a fabric softener and conditioner for compounding into home laundry softeners.

"Zelec."²⁸ Trademark for a series of antistatic agents, both durable and nondurable.

"Zendel."²¹⁴ Trademark for polyethylene films. Available both cast and blown. Used in packaging products and netting for agricultural and construction industries.

"Zenite."²⁸ Trademark for a group of rubber accelerators based on zinc salt of 2-mercaptobenzothiazole, with or without various modifying agents.

"Zeo."²⁸⁵ Trademark for a series of hydrous silicas produced by the precipitation process.

Uses: Reinforcing agent for rubber compounds; adsorbent carrier for insecticides; flattening agent for lacquers and varnishes; anticaking agent in foods, feeds, and chemicals.

"Zeodur."¹⁸⁴ Trademark for a processed greensand used as a low capacity inorganic cation exchanger suitable for salt cycle, primarily water softening.

"Zeogel."²³⁶ Trademark for a special clay used in drilling fluids to give an equally high yield and stable viscosity and gel characteristics in either fresh or salt water, regardless of the concentration of salt in the latter.

"Zeokarb."¹⁸⁴ Trademark for a commercial grade cation exchanger of sulfonated coal. Available in two ionic forms, Na and H. Intermediate acidity; used for metal recovery, deionization, removal of cations, purification and esterification catalyst.

zeolite. A natural hydrated silicate of aluminum and either sodium or calcium or both, of the type $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot n\text{SiO}_2 \cdot x\text{H}_2\text{O}$; or an artificial ion-exchange resin. Both natural and artificial zeolites are used extensively for water softening. For this purpose the sodium or potassium compounds are required, since their usefulness depends on the cationic exchange of the sodium of the zeolite for the calcium or magnesium of hard water. When the zeolite has become saturated with calcium or magnesium ion, it is flooded with strong salt solution; a reverse exchange of cations takes place, and the material is regenerated. The natural zeolites are analcite, chabazite, heulandite, natrolite, stilbite, and thomsonite.

Artificial zeolites are made in a variety of forms ranging from gelatinous to porous and sandlike, and are used as gas adsorbents, drying agents, and catalysts as well as water softeners. They include such diverse groups of compounds of sulfonated organics or basic resins, which act in a similar manner to effect either cation or anion exchange. See ion exchange resin; molecular sieve; water purification.

"Zeotone."¹⁰⁸ Trademark for a powdered, corrosion-inhibiting, hexametaphosphate compound specially formulated for cleaning and disinfecting domestic and industrial water softeners.

"Zepar" BP.²⁸ Trademark for a reducing agent based on sodium hydrosulfite; used as a bleaching agent for ground wood pulp, unbleached pulp, and old papers.

"Zepel."²⁸ Trademark for a fluorocarbon textile finish used as a durable oil- and water-repellent.

"Zephiran" Chloride.¹⁶² Trademark for benzalkonium chloride.

Zerewitinoff reagent. Solution of methylmagnesium iodide in purified n-butyl ether. A clear, light, colored liquid which reacts rapidly with moisture and oxygen.

Uses: Analytical reagent for active hydrogen atoms in organic compounds; also to determine water, alcohols, and amines in inert solvents.

"Zerice."⁵¹ Trademark for light lubricating oils suitable for many general machinery applications, particularly at low temperatures. Used in refrigerating machines having low evaporator temperatures.

"Zerlate."²⁸ Trademark for a wettable fungicide powder containing 76% ziram.
Hazard: Irritant to eyes and mucous membranes.

"Zerlon."²³³ Trademark for a methyl methacrylate-styrene copolymer used as a plastic molding material.

zero group. See group (I).

"Zerok" 101.⁴¹ Trademark for a synthetic resin coating of the vinyl type which is resistant to oxidizing acids and useful for protection against fumes and splashing, up to 150°F.

"Zero-Lite."²⁴⁷ Trademark for a low temperature expanded polystyrene pipe insulation.

"Zerostat."⁴⁴³ Trademark for antistatic finishes for hydrophobic synthetic fibers.

zeroth law (of thermodynamics). Two bodies which have been shown to be individually in equilibrium with a third body will be in equilibrium when placed in contact with each other, that is, they will have the same temperature. (H. Reiss).

"Zeset."²⁸ Trademark for a fiber-reactant resin for crease resistance and dimensional stabilization of textiles.

"Zetafin."²³³ Trademark for a series of ethylene-ethyl acrylate resins which are soft, highly flexible copolymers with end-use characteristics similar to vinyl.

zeta potential (electrokinetic potential). The potential across the interface of all solids and liquids. Specifically, the potential across the diffuse layer of ions surrounding a charged colloidal particle, which is largely responsible for colloidal stability. Discharge of the zeta potential, accompanied by precipitation of the colloid, occurs by addition of polyvalent ions of sign opposite to that of the colloidal particles. Zeta potentials can be calculated from electrophoretic mobilities, i.e., the rates at which colloidal particles travel between charged electrodes placed in the solution.

"Zetax."²⁴⁵ Trademark for zinc 2-mercaptobenzothiazole.

Properties: Pale yellow powder; sp. gr. $1.70 \pm .03$; melting point above 300°C; zinc content 15-18%.
Use: Rubber accelerator.

Ziegler catalyst. A type of stereospecific catalyst, usually a chemical complex derived from a transition

metal halide and a metal hydride or a metal alkyl. The transition metal may be any of those in groups IV to VIII of the periodic table; the hydride or alkyl metals are those of groups I, II, and III. Typically, titanium chloride is added to aluminum alkyl in a hydrocarbon solvent to form a dispersion or precipitate of the catalyst complex. These catalysts usually operate at atmospheric pressure and are used to convert ethylene to linear polyethylene, and also in stereospecific polymerization of propylene to crystalline polypropylene (Ziegler process). See also Natta catalyst.

"Zilloy."²⁶⁸ Trademark for a zinc-base alloy.

"Zimate." See "Ethyl Zimate"; "Methyl Zimate."

"Zinar."⁷⁹ Trademark for a high melting, pale colored zinc resin which has a negative acid number (slightly basic).

Uses: Paints; varnishes; adhesives; linoleum print-paint; ethyl cellulose lacquers.

zinc Zn Metallic element of atomic number 30, Group IIB of periodic table. Atomic weight 65.37. Valence 2. Five stable isotopes.

Properties: Shining white metal with bluish gray luster (called spelter). Not found native. Soluble in acids and alkalis. Insoluble in water. Sp. gr. 7.14; m.p. 419°C; b.p. 907°C. Malleable at 100-150°C; strongly electropositive. Zinc foil will ignite in presence of moisture. Low toxicity.

Ores and minerals: See calamine, franklinite, hydrozincite, smithsonite, sphalerite, willemite, wurtzite.

Sources: British Columbia; Japan; Mexico; U.S. (Colorado); Peru; Australia.

Derivation: Extracted from ores by two distinct methods, both starting with zinc oxide formed by roasting the ores: (1) the pyrometallurgical or distillation process wherein the zinc oxide is reduced with carbon in retorts from which the resultant zinc is distilled and condensed; and (2) the hydrometallurgical or electrolytic process wherein the zinc oxide is leached from the roasted or calcined material with sulfuric acid to form zinc sulfate solution which is electrolyzed in cells to deposit zinc on cathodes.

Grades: Special high-grade (99.990%); high-grade (89.90%); intermediate (99.5%); brass special (99%); prime western (98%).

Forms available: Slab, rolled (strip, sheet, rod, tubing), wire, mossy zinc, zinc dust powder (99% pure); single crystals; zinc anodes.

Hazard (dust): Flammable, dangerous fire and explosion risk. See also zinc dust.

Uses: Alloys (brass, bronze, and die-casting alloys); galvanizing iron and other metals; electroplating; metal spraying; automotive parts; electrical fuses, anodes; dry cell batteries; fungicides; nutrition (essential growth element). Roofing, gutters; engravers' plates; cable wrappings; organ pipes.

Shipping regulations: (Dust or powder) (Air) Flammable Solid label.

For further information refer to American Zinc Institute, 292 Madison Ave., New York.

zinc 65. Radioactive isotope of mass number 65.

Properties: Half-life, 250 days; radiation, beta and gamma.

Derivation: Pile irradiation of zinc metal and, in the cyclotron, by bombarding copper 65 with deuterons. Forms available: Zinc metal and zinc chloride in hydrochloric acid solution.

Hazard: A radioactive poison.

Uses: Tracer nuclide in study of wear in alloys, the

nature of phosphor activators, galvanizing, the function of traces of zinc in body metabolism, the functions of oil additives in lubricating oils, etc.
Shipping regulations: Consult regulations.

zinc abietate. See zinc resinate.

zinc acetate $\text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, monoclinic, crystalline plates; pearly luster; faint acetous odor; astringent taste. Soluble in water and alcohol. Sp. gr. 1.735; loses $2\text{H}_2\text{O}$ at 100°C ; m.p. 200°C (decomp.). Low toxicity.
Derivation: Action of acetic acid on zinc oxide.
Containers: Bottles; cartons; fiber drums; carlots. Also available in solution.
Uses: Medicine; preserving wood; textile dyeing (mordant and resist); zinc chromate; laboratory reagent; feed additive; cross-linking agent for polymers; ingredient of dietary supplements (up to 1 mg daily).

zinc acetylacetonate $\text{Zn}[\text{OC}(\text{CH}_3):\text{CHCO}(\text{CH}_3)]_2$.

Properties: Crystalline solid; m.p. 138°C ; b.p. sublimes. Very soluble in benzene and acetone; decomposes in water. Low toxicity.
Uses: Catalyst in synthesis of long-chain alcohols and aldehydes; textile weighting agent.

"Zincalume."²⁸⁸ Trademark for a bright zinc electroplating process for consumer's goods and military materials. The bath contains zinc cyanide, sodium cyanide, sodium hydroxide, and addition agents.

zinc ammonium chloride $\text{ZnCl}_2 \cdot 2\text{NH}_4\text{Cl}$. A complex salt. Double salts with 3 or 6 molecules ammonium chloride have also been prepared.

Properties: White powder or crystals; soluble in water; sp. gr. 1.8. Low toxicity.
Grade: Technical (foaming and nonfoaming).
Containers: Bags; barrels; carlots.
Uses: Welding; soldering flux; dry batteries; galvanizing.

zinc ammonium nitrite. $\text{ZnNH}_4(\text{NO}_2)_3$.

Properties: White powder. Strong oxidizing agent.
Hazard: Dangerous fire risk in contact with organic materials.
Shipping regulations: (Rail) Yellow label.

zinc antimonide Zn_3Sb_2 . Silvery-white crystals; sp. gr. 6.33; m.p. 570°C . Decomposes in water. Used in thermoelectric devices.

Hazard: May be toxic and irritant to skin.

zinc arsenate. Various forms are known. The description following is for zinc orthoarsenate, $\text{Zn}_3(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Properties: White, odorless powder; sp. gr. 3.31 (15°C); loses $1\text{H}_2\text{O}$ at 100°C . Insoluble in water; soluble in acids and alkalis.

Derivation: (a) Occurs in nature as mineral koettigite; (b) by reactoin of a solution of sodium arsenate and a soluble zinc salt.

Hazard: Highly toxic by ingestion and inhalation.

Use: Insecticide; wood preservative.

Shipping regulations: (Rail, Air) Poison label.

zinc arsenite (zinc metaarsenite; ZMA) $\text{Zn}(\text{AsO}_2)_2$.

Properties: Colorless powder, soluble in acids, insoluble in water. Federal Specification TT-W-581 describes the composition of the solution used for wood preservation.

Hazard: Highly toxic by ingestion and inhalation.

Uses: Timber preservative; insecticide.

Shipping regulations: (Rail, Air) Poison label.

zinc bacitracin.

Properties: Creamy-white powder; slightly soluble in water; good thermal stability. Usually has 50-60 units/mg of bacitracin activity. Nontoxic.

Derivation: Action of zinc salts on bacitracin broth.

Grade: U.S.P.

Use: Preserving silage for feed; medicine.

zinc borate. Typical composition: ZnO 45%, B_2O_3 34%. May have 20% water of hydration.

Properties: White, amorphous powder; soluble in dilute acids; slightly soluble in water. Zinc borate of composition $3\text{ZnO} \cdot 2\text{B}_2\text{O}_3$ has a sp. gr. 3.64; m.p. 980°C . Nonflammable; low toxicity.

Derivatoin: Interaction of the oxides at 500 – 1000°C , or of zinc oxide slurries with solutions of boric acid or borax.

Uses: Medicine; fireproofing textiles; fungistat and mildew inhibitor; flux in ceramics.

zinc bromate $\text{Zn}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White solid; sp. gr. 2.566; m.p. 100°C ; deliquescent; loses $6\text{H}_2\text{O}$ at 200°C . Very soluble in water.

Hazard: Dangerous fire risk in contact with organic materials; strong oxidizing agent.

Shipping regulations: (Air) Oxidizer label.

zinc bromide ZnBr_2 .

Properties: White, hygroscopic, crystalline powder. Soluble in water, alcohol and ether. Sp. gr. 4.219; m.p. 394°C ; b.p. 650°C . Low toxicity.

Derivation: Interaction of solutions of barium bromide and zinc sulfate, with subsequent crystallization.

Uses: Medicine; photography (plates, papers); manufacture of rayon. A solution of 80% zinc bromide is used as a radiation viewing shield.

zinc butylxanthate $\text{Zn}(\text{C}_4\text{H}_9\text{OCS}_2)_2$.

Properties: White powder; sp. gr. 1.45; decomposes when heated; moderately soluble in benzene and ethylene dichloride; slightly soluble in acetone; insoluble in water and gasoline.

Use: Ultra-accelerator used in self-curing rubber cements.

See also xanthate.

zinc cadmium sulfide. A fluorescent pigment; a phosphor.

Hazard: Probably toxic. See cadmium.

zinc caprylate (zinc octanoate) $\text{Zn}(\text{C}_8\text{H}_{15}\text{O}_2)_2$.

Properties: Lustrous scales; slightly soluble in boiling water, fairly soluble in boiling alcohol. M.p. 136°C . Decomposes in moist atmosphere giving off caprylic acid.

Derivation: By precipitation from a solution of ammonium caprylate with zinc sulfate.

Use: Fungicide.

zinc carbolate. See zinc phenate.

zinc carbonate ZnCO_3 .

Properties: White, crystalline powder. Soluble in acids, alkalis and ammonium salt solutions; insoluble in water. Sp. gr. 4.42–4.45; evolves carbon dioxide at 300°C . Nontoxic.

Derivation: (a) Grinding the mineral smithsonite; (b) Action of sodium bicarbonate on a solution of a zinc salt.

Uses: Ceramics; fire-proofing filler for rubber and plastic compositions exposed to flame temperature;

cosmetics and lotions; pharmaceuticals (ointments, dusting powders); zinc salts; feed additive.

zinc chlorate $\text{Zn}(\text{ClO}_3)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless to yellowish crystals; deliquescent; sp. gr. 2.15; decomposes at 60°C . Soluble in water and alcohol; soluble in glycerin and ether.

Hazard: Dangerous fire risk in contact with organic materials. Strong oxidizing agent.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

zinc chloride ZnCl_2 .

Properties: White granular deliquescent crystals or crystalline powder; soluble in water, alcohol, glycerine and ether. Sp. gr. 2.91; m.p. 290°C ; b.p. 732°C . A 10% solution is acid to litmus.

Derivation: Action of hydrochloric acid on zinc or zinc oxide.

Method of purification: Recrystallization.

Grades: C.P.; technical. Fused; crystal; granulated; 62½% solution; 50% solution; U.S.P.

Containers: Bottles; drums; tank cars; tank trucks.

Hazard: (Solid) Skin irritant. (Solution) Severe irritant to skin and tissue. Tolerance, (as fume) 1 mg per cubic meter of air.

Uses: Galvanizing iron; catalyst; dehydrating and condensing agent in organic synthesis; wood preservative; soldering fluxes; burnishing and polishing compounds for steel; electroplating; antiseptic and deodorant preparations (up to 2% solution); textiles (mordant, carbonizing agent, mercerizing, sizing and weighting compositions, resist for sulfur colors, albumin colors and para red); adhesives; dental cements; glass etching; petroleum refining; parchment; dentrifices; embalming and taxidermists' fluids; medicine; dyestuffs; pigments; antistatic; feed additive; denaturant for alcohol; dietary supplement.

Shipping regulations: (Air) Corrosive label.

zinc chloride, chromated. A mixture of zinc chloride and sodium dichromate used as a wood preservative. Federal Specification TT-W-551 requires that it contain not less than 77.5% zinc chloride and 17.5% sodium dichromate dihydrate.

Hazard: Toxic by ingestion.

zinc chloroiodide. Mixture of zinc chloride and iodide.

Properties: White powder. Soluble in water.

Uses: Disinfectant; pharmaceutical preparations.

zinc chromate ZnCrO_4 . There is a series of compounds in which the ratio of ZnO to CrO_3 is 5:1, 4:1, 2:1, 1:1 and 1:2, usually with some water of crystallization. The basic compounds containing the highest zinc content are more insoluble and stable than the acidic compounds. The following is a description of ZnCrO_4 .

Properties: Yellow powder; sp. gr. 3.40; insoluble in water; soluble in acids.

Derivation: Action of chromic acid on slurries of zinc oxide, or on zinc hydroxide.

Grades: Technical; C.P.

Containers: Bottles, drums.

Hazard: Toxic by ingestion and inhalation; strong irritant. A carcinogen. Tolerance, 0.1 mg per cubic meter of air.

Uses: Artists' color; varnishes; pigment in rust-resistant primer and automotive paints; to impart corrosion resistance to epoxy laminates.

See also zinc yellow (principally zinc potassium chromate).

"Zincrometal."⁵⁷⁹ Trademark for a precoated, highly corrosion-resistant steel designed chiefly for use in automobile bodies. The coating is stated to be comprised of two parts: an undercoat of zinc-chromium solution and a topcoat of zinc-rich epoxy-based resin. The combination of coatings is applied to the steel before shaping and other mechanical processing. The effectiveness of this product is said to be greater than that of other anticorrosion systems.

zinc cyanide $\text{Zn}(\text{CN})_2$.

Properties: White powder. Sp. gr. 1.852; m.p. 800°C (decomposes); soluble in dilute mineral acids with production of hydrogen cyanide; soluble in alkalies; insoluble in water and alcohol.

Derivation: By precipitation of a solution of zinc sulfate or chloride with potassium cyanide.

Grade: Technical.

Containers: Glass bottles; kegs; drums.

Hazard: Highly toxic by ingestion and inhalation.

Uses: Medicine; metal plating; chemical reagent; insecticide.

Shipping regulations: (Air) Poison label. (Rail) Consult regulations.

zinc dialkylldithiophosphate. A tube oil additive for corrosion resistance, wear resistance, antioxidant.

zinc dibenzylldithiocarbamate $\text{Zn}[\text{SCSN}(\text{C}_6\text{H}_5)_2]_2$.

Properties: White powder; sp. gr. 1.41; melting range $165\text{--}175^\circ\text{C}$; moderately soluble in benzene and ethylene dichloride; insoluble in acetone, gasoline, and water.

Uses: Accelerator for latex dispersions and cements.

zinc dibutylldithiocarbamate $\text{Zn}[\text{SC}(\text{S})\text{N}(\text{C}_4\text{H}_9)_2]_2$.

Properties: White powder; sp. gr. (20/20°C) 1.24; melting range $104\text{--}108^\circ\text{C}$; pleasant odor. Soluble in carbon disulfide; benzene, and chloroform; insoluble in water.

Uses: Accelerator for latex dispersions, cements, etc.; ultra-accelerator for lubricating oil additive.

zinc dichromate $\text{ZnCr}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: Orange-yellow powder; soluble in acids and hot water; insoluble in alcohol and ether.

Derivation: Action of chromic acid on zinc hydroxide.

Hazard: Toxic by ingestion and inhalation.

Use: Pigment.

zinc diethyl. See diethylzinc.

zinc diethyldithiocarbamate $\text{Zn}[\text{SC}(\text{S})\text{N}(\text{C}_2\text{H}_5)_2]_2$.

Properties: White powder; sp. gr. (20/20°C) 1.47; melting range $172\text{--}176^\circ\text{C}$. Soluble in carbon disulfide, benzene and chloroform; insoluble in water.

Containers: Drums.

Hazard: Strong irritant to eyes and mucous membranes.

Uses: Rubber vulcanization accelerator, especially latex foam; heat stabilizer for polyethylene.

zinc dimethyldithiocarbamate. See ziram.

zinc dimethyldithiocarbamate cyclohexylamine complex (zinc dithioamine complex). White powder or slurry of low solubility.

Hazard: Toxic by ingestion.

Uses: Fungicide; rodent poison; deer and rabbit repellent.

zinc dioxide. See zinc peroxide.

zinc dithionite. See zinc hydrosulfite.

zinc dust. A gray powder.

Grades: Commercial; pigment.

Containers: Drums; carlots.

Hazard: Dangerous fire risk. May form explosive mixtures with air; in bulk when damp may heat and ignite spontaneously on exposure to air.

Uses: Zinc salts and other zinc compounds; reducing agent, precipitating agent, purifier, catalyst; rust-resistant paints; bleaches; pyrotechnics; soot-removal; pipe-thread compounds; sherardizing; decorative effect in resins; autobody coatings.

Shipping regulations: (Air) Flammable Solid label.

zinc ethyl. See diethylzinc.

zinc ethylenebisdithiocarbamate. See zineb.

zinc 2-ethylhexoate. See zinc octoate.

zinc ethylsulfate $\text{Zn}(\text{C}_2\text{H}_5\text{SO}_4)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless, hygroscopic, crystalline leaflets. Soluble in water and alcohol.

Derivation: Interaction of zinc hydroxide and diethyl sulfate.

Use: Organic synthesis.

zinc fluoride ZnF_2 .

Properties: White powder. Soluble in hot acids; slightly soluble in water; insoluble in alcohol. Sp. gr. (15°C) 4.84; m.p. 872°C; b.p. about 1500°C.

Derivation: (a) Action of hydrofluoric acid on zinc hydroxide; (b) Addition of sodium fluoride to a solution of zinc acetate.

Grade: Technical, about 95% pure.

Containers: Drums, barrels.

Hazard: Toxic. Tolerance (as F), 2.5 mg. per cubic meter of air.

Uses: Ceramic glazes and enamels; impregnating lumber; galvanizing.

zinc fluoroborate $\text{Zn}(\text{BF}_4)_2$. Colorless liquid, handled as 40 or 48% solution.

Uses: Plating and bonderizing; resin curing.

zinc fluorosilicate (zinc silicofluoride) $\text{ZnSiF}_6 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals; sp. gr. 2.104. Decomposes on heating; soluble in water.

Derivation: Reaction of zinc oxide and fluosilicic acid.

Uses: Concrete hardener; laundry sour; preservative; mothproofing agents.

zinc formaldehyde sulfoxylate $\text{Zn}(\text{HSO}_2 \cdot \text{CH}_2\text{O})_2$ (normal); $\text{Zn}(\text{OH})(\text{HSO}_2 \cdot \text{CH}_2\text{O})$ (basic).

Properties: Rhombic prisms. Very soluble in water (normal) (basic form is insoluble in water); insoluble in alcohol. Decomposes in acid.

Derivation: Reaction of formaldehyde and zinc sulfoxylate.

Grades: Basic; normal.

Containers: 250-lb and 300-lb drums.

Hazard: Probably toxic by ingestion.

Uses: Stripping and discharging agent for textiles.

See also hydrosulfite-formaldehyde preparations.

zinc formate $\text{Zn}(\text{CHO}_2)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals; sp. gr. (20°C) 2.207; loses $2\text{H}_2\text{O}$ at 140°C. Soluble in water; insoluble in alcohol.

Derivation: Action of formic acid on zinc hydroxide.

Hazard: May be toxic by ingestion.

Uses: Catalyst for production of methyl alcohol; waterproofing agent; textiles; antiseptic.

zinc gluconate. Dietary supplement and food additive; vitamin tablets.

zinc glycerophosphate (zinc glycerinophosphate)

$\text{C}_3\text{H}_5(\text{OH})_2\text{OPO}_3\text{Zn}$.

Properties: White, amorphous powder. Soluble in water; insoluble in alcohol and ether.

Derivation: Action of glycerophosphoric acid on zinc hydroxide.

Use: Medicine.

zinc green. One of a group of brilliant green pigments consisting of mixtures of Prussian blue and zinc yellow. They are permanent to light but not to alkali or water. Used for flat wall paints and interior work.

zinc hydrosulfite (zinc dithionite) (ZnS_2O_4) .

Properties: White, amorphous solid; soluble in water.

Grade: Technical.

Containers: Cartons, drums; carlots.

Uses: Brightening groundwood, kraft, and other paper pulps; treatment of beet and cane sugar juices; depressant in mining flotations; bleaching textiles, vegetable oils, straw, hemp, vegetable tannins, animal glue, etc.

zinc hydroxide $\text{Zn}(\text{OH})_2$.

Properties: Colorless crystals; sp. gr. 3.053; decomposes 125°C. Very soluble in water. Forms both zinc salts and zincates.

Derivation: Addition of a strong alkali to a solution of a zinc salt.

Uses: Intermediate; absorbent in surgical dressings; rubber compounding.

zinc hypophosphite $\text{Zn}(\text{H}_2\text{PO}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: White hygroscopic crystals. Soluble in water and alkalies.

Derivation: Action of hypophosphorous acid on zinc hydroxide.

Use: Medicine.

zinc iodide ZnI_2 .

Properties: Hygroscopic, white, crystalline powder; sharp, saline taste. Turns brown on exposure to light or air. Soluble in water, alcohol and alkalies. Sp. gr. 4.67; m.p. 446°C; b.p. 625°C (decomposes).

Derivation: Interaction of barium iodide and zinc sulfate, with subsequent crystallization.

Uses: Medicine (topical antiseptic); analytical reagent.

zinc lactate $\text{Zn}(\text{C}_3\text{H}_5\text{O}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water. Combustible. Low toxicity.

Derivation: Action of lactic acid on zinc hydroxide.

Use: Medicine.

zinc laurate $\text{Zn}(\text{C}_{12}\text{H}_{23}\text{O}_2)_2$.

Properties: White powder; m.p. 128°C; almost insoluble in water and alcohol. Combustible. Low toxicity.

Derivation: Precipitation of a soluble coconut oil soap with a solution of a zinc salt.

Containers: Barrels.

Uses: Paints; varnishes; rubber compounding (softener and activator).

zinc linoleate $\text{Zn}(\text{C}_{17}\text{H}_{31}\text{COO})_2$. Brown solid containing 8.5 to 9.5% zinc. Combustible. Low toxicity.

Derivation: Precipitation from solutions of sodium linoleate and soluble zinc salt, or by fusion of the fatty acid and zinc oxide.

Uses: Paint drier, especially with cobalt and manganese soaps.

zinc malate $\text{Zn}(\text{OOCCH}_2\text{CHOHCOO}) \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder. Soluble in water. Combustible. Low toxicity.

Derivation: Action of malic acid on zinc hydroxide.

Use: Medicine.

zinc 2-mercaptobenzothiazole $\text{Zn}(\text{C}_7\text{H}_4\text{NS}_2)_2$. Rubber accelerator; fungicide.

zinc molybdate $\text{ZnMoO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Solid; sp. gr. 3.3; m.p. 1650°C (approx); insoluble in water.

Uses: Anticorrosion agent; starting material for growing single crystals.

zinc naphthenate $\text{Zn}(\text{C}_6\text{H}_5\text{COO})_2$.

Properties: Amber, viscous, basic liquid or basic solid. The liquid contains 8–10% Zn, the solid contains 16% Zn. Very soluble in acetone. Combustible. Low toxicity.

Derivation: Fusion of zinc oxide or hydroxide and naphthenic acid, or precipitation from mixture of soluble zinc salts and sodium naphthenate.

Containers: Small metal drums; fiber drums.

Uses: Drier and wetting agent in paints, varnishes and resins; insecticide, fungicide, and mildew preventive; wood preservative; waterproofing textiles; insulating materials.

zinc nitrate $\text{Zn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless lumps or crystals. Soluble in water and alcohol. Sp. gr. (13°C) 2.065; m.p. 36.4°C; loses water of crystallization between 105 and 131°C.

Derivation: Action of nitric acid on zinc or zinc oxide. Containers: Drums; carlots.

Hazard: Dangerous fire and explosion risk; strong oxidizing agent. Moderately toxic.

Uses: Acidic catalyst; latex coagulant; medicine; reagent and intermediate; mordant.

Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Oxidizer label.

zinc octanoate. See zinc caprylate.**zinc octoate (zinc 2-ethylhexoate)**

Properties: Light straw-colored viscous liquid. Sp. gr. 1.16; insoluble in water, soluble in common organic hydrocarbon solvents. Combustible. Low toxicity.

Use: Catalyst.

zinc oleate $\text{Zn}(\text{C}_{17}\text{H}_{33}\text{COO})_2$.

Properties: Dry, white to tan, greasy, granular powder, containing from 8.5 to 10.5% zinc; m.p. 70°C. Soluble in alcohol, ether, carbon disulfide and ligroin; insoluble in water. Combustible. Low toxicity.

Derivation: Interaction of solutions of zinc acetate and sodium oleate, or by fusion of zinc oxide and oleic acid.

Uses: Paints, resins and varnishes (drier).

"Zincon."¹⁶⁹ Trademark for 2-carboxy-2'-hydroxy-5'-sulfoformazylbenzene used in colorimetric determination of zinc and copper.

zinc orthoarsenate. See zinc arsenate.**zinc orthophosphate.** See zinc phosphate.**zinc orthosilicate.** See zinc silicate.**zinc oxalate** $\text{ZnC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$.

Properties: White powder. Soluble in acids and alkalies; slightly soluble in water. Sp. gr. (24°C) 2.562; m.p. (dec) 100°C. Combustible.

Derivation: Interaction of zinc sulfate and sodium oxalate.

Uses: Zinc oxide; organic synthesis.

zinc oxide (Chinese white; zinc white) ZnO .

Properties: Coarse white or grayish powder; odorless; bitter taste; absorbs carbon dioxide from the air; has greatest ultraviolet absorption of all commercial pigments; sp. gr. 5.47; m.p. 1975°C; soluble in acids and alkalies; insoluble in water and alcohol. Noncombustible; nontoxic as powder.

Derivation: (a) Oxidation of vaporized pure zinc

(French process) or (b) roasting of zinc oxide ore (franklinite) with coal and subsequent oxidation with air; (c) similar treatment starting with other ores; (d) oxidation of vapor-fractionated die castings.

Grades: American process, lead-free; French process, lead-free, green seal, red seal, white seal (according to fineness); leaded (with lead sulfate); U.S.P., single crystals.

Containers: Boxes; drums; multiwall paper bags.

Hazard: ZnO fume is harmful by inhalation. Tolerance (fume), 5 mg per cubic meter in air. ZnO powder reacts violently with chlorinated rubber at 215°C.

Use: Accelerator activator, pigment, and reinforcing agent in rubber; ointments; pigment and mold-growth inhibitor in paints; ceramics; floor tile; glass; zinc salts; feed additive; dietary supplement; seed treatment; cosmetics; semiconductor in electronic devices; photoconductor in office copying machines and in color photography; piezoelectric devices.

zinc oxychloride. A saturated solution of zinc chloride and zinc oxide. Used in dentistry.

zinc palmitate $\text{Zn}(\text{C}_{16}\text{H}_{31}\text{O}_2)_2$.

Properties: White amorphous powder; sp. gr. 1.121; m.p. 100°C; insoluble in water and alcohol; slightly soluble in benzene and toluene. Combustible; low toxicity.

Containers: Cartons, bags.

Uses: Flattening agent in lacquer; pigment suspending agent for paints; rubber compounding; lubricant in plastics.

zinc perborate $\text{Zn}(\text{BO}_3)_2$ with water of hydration.

Properties: Amorphous, white powder; insoluble in water but slowly decomposed by it, liberating hydrogen peroxide.

Derivation: Interaction of sodium peroxide, boric acid and zinc salt, or of boric acid and zinc peroxide.

Containers: Tins, glass bottles.

Hazard: Fire risk when wet, in contact with organic materials.

Uses: Medicine; oxidizing agent.

zinc permanganate $\text{Zn}(\text{MnO}_4)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Violet-brown or black, hygroscopic crystals; sp. gr. 2.47; loses $5\text{H}_2\text{O}$ at 100°C. Decomposes on exposure to light and air. Soluble in water and acids; decomposes in alcohol.

Grade: Technical (about 95% pure).

Containers: Glass bottles, tins.

Hazard: Dangerous fire risk in contact with organic materials; strong oxidizing agent.

Uses: Oxidizing agent; medicine (antiseptic).

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

zinc peroxide (zinc dioxide) ZnO_2 .

Properties: White powder containing 45–60% ZnO_2 , balance ZnO ; sp. gr. 1.571; decomposes rapidly above 150°C. Decomposes in acids, alcohol, acetone; insoluble in water but decomposed by it.

Derivation: Action of barium peroxide on zinc sulfate solution, followed by filtration.

Grades: U.S.P. (mixture of peroxide, carbonate and hydroxide); technical, 50–60%.

Containers: Glass bottles; drums.

Hazard: Severe explosion risk when heated; explosive range from 190°C to 212°C. Fire risk in contact with organic materials. Strong oxidizing agent.

Uses: Cosmetics; medicine; high-temperature oxidation reactions.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

zinc phenate (zinc carbolate; zinc phenolate)

$\text{Zn}(\text{C}_6\text{H}_5\text{O})_2$. (May be only a mixture of zinc oxide and phenol.)

Properties: White powder. Soluble in alcohol; slightly soluble in water. Combustible.

Derivation: By heating zinc hydroxide with phenol and extracting with alcohol.

Hazard: Probably toxic by ingestion.

Uses: Medicine; insecticide.

zinc 1,4-phenolsulfonate (zinc sulfophenate; zinc sulfo-carbolate) $\text{Zn}(\text{SO}_3\text{C}_6\text{H}_4\text{OH})_2 \cdot 8\text{H}_2\text{O}$.

Properties: Colorless, transparent crystals or white granular powder; odorless; astringent metallic taste; effloresces in air; turns pink on exposure to air and light; loses water of crystallization at 120°C ; soluble in water and alcohol.

Derivation: By heating zinc hydroxide with para-phenolsulfonic acid.

Grade: Technical.

Containers: Glass bottles; drums.

Hazard: Probably toxic by ingestion.

Use: Insecticide; medicine (antiseptic).

zinc phosphate (zinc orthophosphate; zinc phosphate, tribasic) $\text{Zn}_3(\text{PO}_4)_2$.

Properties: White powder. Soluble in acids and ammonium hydroxide; insoluble in water. Sp. gr. 3.998 (15°C); m.p. 900°C . Low toxicity.

Derivation: Interaction of zinc sulfate and trisodium phosphate.

Grade: Technical, about 98% pure.

Containers: Boxes; wooden kegs; glass bottles.

Uses: Dental cements; phosphors; conversion coating of steel, aluminum, and other metal surfaces.

zinc phosphide Zn_3P_2 .

Properties: Dark gray, gritty powder; sp. gr. 4.55 (15°C); m.p. $>420^\circ\text{C}$; stable if kept dry; insoluble in alcohol; soluble in acids; decomposes in water.

Derivation: By passing phosphine into a solution of zinc sulfate.

Grade: Technical, about 80–85% pure.

Containers: Tins; glass bottles.

Hazard: Highly toxic by ingestion. Reacts violently with oxidizing agents; produces toxic and flammable phosphine by reaction with acids.

Uses: Medicine; rat poisons.

Shipping regulations: (Air) Poison label. (Rail) Poisonous solids, n.o.s., Poison label.

zinc potassium chromate. See zinc yellow.**zinc potassium iodide**. See potassium zinc iodide.**zinc propionate** $\text{Zn}(\text{OOCCH}_2\text{CH}_3)_2$.

Properties: Platelets, tablets, or needlelike crystals. Fairly soluble in water, slightly soluble in alcohol.

Decomposes in moist atmosphere, liberating propionic acid. Combustible; low toxicity.

Derivation: By dissolving zinc oxide in dilute propionic acid and concentrating the solution.

Use: Fungicide on adhesive tape.

zinc pyrophosphate $\text{Zn}_2\text{P}_2\text{O}_7$.

Properties: White powder; sp. gr. 3.756 (23°C); soluble in acids and alkalis; insoluble in water.

Containers: Wooden kegs or fiber drums.

Use: Pigment.

zinc resinate.

Properties: Powder; clear amber lumps, or yellowish

liquid. May be acid, basic or neutral. Soluble in some organic solvents (ether, amyl alcohol). Combustible.

Chief constituent: Zinc abietate.

Derivation: By fusion of zinc oxide and rosin, or by precipitation from solutions of zinc salts and sodium resinate.

Containers: 55-gal drums.

Uses: Wetting, dispersing and hardening agent; drier in paints, varnishes and resins.

zinc rhodanide. See zinc thiocyanate.**zinc ricinoleate**

$\text{Zn}[\text{CH}_2(\text{CH}_2)_7\text{CHOHCH}_2\text{CH}_2\text{CH}(\text{CH}_2)_7\text{CO}_2]_2$.

Properties: Fine white powder with faint fatty acid odor.

M.p. $92\text{--}95^\circ\text{C}$; sp. gr. (25/ 25°C) 1.10. Combustible.

Low toxicity.

Containers: 50-lb bags.

Uses: Fungicide; emulsifier; greases; lubricants; waterproofing; lubricating-oil additive; stabilizer in vinyl compounds.

"Zincrometal."³⁷⁹ Trademark for a precoated, highly corrosion-resistant steel designed chiefly for use in automobile bodies. The coating is stated to be comprised of two parts: an undercoat of zinc-chromium solution and a topcoat of a zinc-rich epoxy-based resin. The combination of coatings is applied to the steel before shaping and other mechanical processing. The effectiveness of this product is said to be greater than that of other anticorrosion systems.

zinc salicylate $\text{Zn}[\text{C}_6\text{H}_4(\text{OH})\text{COO}]_2 \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline needles or powder; soluble in water and alcohol. Combustible; low toxicity.

Derivation: By heating zinc hydroxide and salicylic acid.

Use: Medicine (antiseptic).

zinc selenide ZnSe .

Properties: Yellowish to reddish solid; sp. gr. 5.42 ($15/4^\circ\text{C}$); m.p. above 1100°C . Insoluble in water.

Hazard: Moderately toxic; fire risk in contact with water or acids.

Use: Windows in infrared optical equipment.

zinc silicate (zinc orthosilicate) Zn_2SiO_4 . See also willemitite.

Properties: White crystals; sp. gr. 4.103; m.p. 1509°C . Insoluble in water.

Uses: Phosphors; spray ingredients; to remove traces of copper from gasoline.

zinc silicofluoride. See zinc fluorosilicate.

zinc-silver oxide battery. Primary or secondary battery used where space and weight are critical, i.e., in missiles. The battery has large energy output for its weight, but the components are expensive and the cycle life is short. To avoid deterioration, potassium hydroxide electrolyte is added just before use.

See also battery.

zinc stearate $\text{Zn}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$. Percentage of zinc may vary according to intended use, some products being more basic than others.

Properties: (pure substance) White, hydrophobic powder, free from grittiness; faint odor; sp. gr. 1.095; m.p. about 130°C . Soluble in acids; soluble in common solvents when hot; insoluble in water, alcohol and ether. Nontoxic. Combustible.

Derivation: Action of sodium stearate on solution of zinc sulfate.

Grades: U.S.P.; technical; available free from chick edema factor.

Containers: Glass bottles, bags, cartons, carlots.

Uses: Cosmetics, lacquers, plastics, powder metal-lurgy; lubricant; mold-release agent; filler; antifoamer; heat and light stabilizer; medicine (dermatitis); tablet manufacture; dietary supplement.

zinc subcarbonate. See zinc carbonate, precipitated.

zinc sulfate (white vitriol; white copperas; zinc vitriol) $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Colorless crystals, small needles or granular crystalline powder, without odor; astringent, metallic taste; efflorescent in air. Solutions acid to litmus. Sp. gr. 1.957 (25/4°C); m.p. 100°C; loses $7\text{H}_2\text{O}$ at 280°C; soluble in water and glycerol; insoluble in alcohol. Low toxicity.

Derivation: (a) Roasting zinc blende and lixiviating, with subsequent purification; (b) action of sulfuric acid on zinc or zinc oxide.

Grades: Technical; U.S.P.; reagent.

Containers: Glass bottles; barrels; fiber drums; multi-wall paper sacks.

Uses: Precipitating agent for viscose rayon; trace nutrient in animal feeds; fertilizer ingredient; fungicide; ore flotation; water purification; galvanizing.

zinc sulfate monohydrate $\text{ZnSO}_4 \cdot \text{H}_2\text{O}$.

Properties: White, free-flowing powder; soluble in water; insoluble in alcohol.

Uses: Rayon manufacture; agricultural sprays; chemical intermediate; dyestuffs; electroplating.

zinc sulfide ZnS . Exists in two crystalline forms, alpha (wurtzite) and beta (sphalerite).

Properties: Yellowish-white powder, stable if kept dry. Alpha: sp. gr. 3.98. Beta: sp. gr. 4.102; changes to alpha form at 1020°C; sublimes at 1180°C. Soluble in acids; insoluble in water. Low toxicity.

Derivation: By passing hydrogen sulfide gas into a solution of a zinc salt.

Grades: Technical; C.P., fluorescent or luminous; single crystals.

Containers: 1-lb bottles; barrels; bags.

Uses: Pigment; white and opaque glass; base for color lakes; rubber; plastics; dyeing (hydrosulfite process); ingredient of lithopone; phosphor in x-ray and television screens; luminous watch faces; fungicide.

zinc sulfite $\text{ZnSO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder; absorbs oxygen from the air to form sulfate. Loses $2\text{H}_2\text{O}$ at 100°C; decomposes at 200°C. Soluble in sulfurous acid; insoluble in cold water and alcohol; decomposes in hot water. Low toxicity.

Derivation: Action of sulfurous acid on zinc hydroxide.

Containers: Glass bottles; tins.

Uses: Medicine; preservative for anatomical specimens.

zinc sulfocarbolate. See zinc phenolsulfonate.

zinc thiocyanate. See zinc thiocyanate.

zinc sulfophenate. See zinc phenolsulfonate.

zinc sulfoxylate ZnSO_2 .

Properties: White crystalline material; decomposed by heat; salt of unstable sulfoxylic acid, H_2SO_2 ; a strong reducing agent.

Derivation: Action of zinc and sulfur chloride in ethereal solution, or of sulfur dioxide on granulated zinc in absolute alcohol.

Containers: Fiber drums; multiwall paper bags.

Use: Stripping agent in dyeing.

zinc telluride ZnTe . Reddish crystals; sp. gr. 6.34 (15°C); m.p. 1238°C. Decomposes in water. Single crystals available for phosphors.

Hazard: Moderately toxic.

zinc thiocyanate (zinc rhodanide; zinc sulfocyanate) $\text{Zn}(\text{CNS})_2$.

Properties: White hygroscopic powder or crystals. Soluble in water, alcohol and ammonium hydroxide. Low toxicity.

Derivation: Interaction of zinc hydroxide and ammonium thiocyanate.

Grades: Technical; solution; reagent; A.C.S.

Containers: Glass bottles; drums.

Uses: Analytical chemistry; swelling agent for cellulose esters; dyeing assistant.

zinc thiophenate. A coined name for a class of peptizing agents for natural and synthetic rubbers. A typical example is the tert-butylphenyl sulfide, $[(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{S}]_2\text{Zn}$.

zinc undecylenate $[\text{CH}_2:\text{CH}(\text{CH}_2)_9\text{COO}]_2\text{Zn}$.

Properties: White amorphous powder; nearly insoluble in water and alcohol; m.p. 115–116°C. Combustible.

Grade: N.F.

Containers: Drums.

Uses: Medicine (fungistat); cosmetics; chemical intermediate.

zinc white. Zinc oxide paste used by commercial artists. See also zinc oxide.

zinc yellow (citron yellow, buttercup yellow, zinc potassium chromate, zinc chrome).

Properties: Greenish-yellow pigment of comparatively low tinting strength. Partially water-soluble. Consists principally of zinc potassium chromate, about $4\text{ZnO} \cdot \text{K}_2\text{O} \cdot 4\text{Cr}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$.

Derivation: Reaction of a solution of potassium dichromate with zinc oxide and sulfuric acid.

Containers: 250-lb bags.

Hazard: Toxic by ingestion.

Uses: Rust-inhibiting paints; artists' color.

zinc zirconium silicate $\text{ZnO} \cdot \text{ZrO}_2 \cdot \text{SiO}_2$.

Properties: White powder; sp. gr. 4.8; density 115 lbs/cu ft; m.p. 2100°C; soluble in hydrofluoric acid; insoluble in water and alkalis; slightly soluble in mineral acids and hot conc. sulfuric acid. Noncombustible.

Containers: Bags, barrels, carloads.

Uses: Opacifier for ceramic glazes.

zineb. Generic name for zinc ethylenebis(dithiocarbamate), $\text{Zn}(\text{CS}_2\text{NHCH}_2)_2$.

Properties: Light-tan solid, insoluble in water; soluble in pyridine. Decomposes on heating.

Derivation: Reaction of sodium ethylenebis(dithiocarbamate) with zinc sulfate or other zinc salts. In practical application as a fungicide these reactants are mixed in the presence of lime, and the zineb is not formed until after reaction of the carbon dioxide of the air with the film of the other chemicals on the leaf or fruit.

Grades: Commercial dusts and wettable powders usually contain 65% active material.

Hazard: Moderately toxic by inhalation and ingestion; irritant to eyes and mucous membranes.

Uses: Insecticide and fungicide.

zingerone (4-(4-hydroxy-3-methoxyphenyl)-2-butanone) $\text{HOC}_6\text{H}_3(\text{OCH}_3)\text{CH}_2\text{CH}_2\text{COCH}_3$.

Properties: Crystals; m.p. 40–41°C. Soluble in ether; sparingly soluble in water and petroleum ether.

Use: Flavoring.

"Zinol."⁷⁹ Trademark for a special zinc resinates in solution in mineral spirits.

Hazard: Flammable; moderate fire risk.

Uses: Printing ink; paint and varnish.

"Zin-O-Lyte."²⁸ Trademark for a series of electroplating products for use in zinc cyanide plating baths.

"Zinophos."⁵⁷ Trademark for a soil insecticide and nematocide whose active ingredient is thionazin (q.v.).

"Zinros."⁷⁹ Trademark for a pale, high-melting zinc resinate used in adhesives; printing ink; rubber compounding.

ziram. Generic name for zinc dimethyldithiocarbamate, $\text{Zn}(\text{SCSNCH}_3\text{CH}_3)_2$.

Properties: White and odorless when pure; sp. gr. 1.71; m.p. 246°C ; almost insoluble in water; soluble in acetone, carbon disulfide, chloroform, in dilute alkalies, and in concentrated hydrochloric acid.

Derivation: Reaction of sodium dimethyldithiocarbamate with a soluble zinc salt in aqueous solution.

Grades: 76% wettable powder; 90% technical powder.

Containers: Multiwall bags; drums.

Hazard: Moderately toxic; strong irritant to eyes and mucous membranes.

Uses: Fungicide; rubber accelerator.

"Zirberk."⁸¹ Trademark for ziram (q.v.).

"Zircaloy." Trademark for alloys of zirconium with low percentages of tin, iron, chromium, and nickel, used as cladding for nuclear fuel elements and other reactor applications.

"Zirco."²³⁰ Trademark for an oil-soluble polymeric zirconyl complex in odorless mineral spirits. Not a paint drier in itself; has synergistic action on metallic driers.

"Zircofrax."²⁸⁰ Trademark for super-refractory products from zirconium oxide and zirconium silicate.

Properties: High heat resistance; great strength; high thermal conductivity; high resistance to attack by acids and acid slags; porosity about 25%; permeability low.

Uses: Bricks and special shapes for ceramic kiln furniture and in chemical and metallurgical furnaces.

zircon ZrSiO_4 or $\text{ZrO}_2 \cdot \text{SiO}_2$. A natural zirconium silicate; represents 60 to 70% of all zirconium used.

Properties: Color brown, gray, red, colorless; luster adamantine; hardness 7.5; sp. gr. 4.68. Insoluble in acids.

Occurrence: Georgia; Florida; Australia; Brazil.

Uses: Source of zirconium oxide, metallic zirconium, and hafnium; abrasive; refractories; enamels; refractory porcelain.

Zircon Granular "G."³³⁷ Trademark for zirconium silicate of 98% minimum purity. Used in refractories, enamel frits, and electrical insulation.

"Zircon H-W."⁴⁴⁶ Trademark for a compound made from the purified mineral by impact pressing, or by air ramming or slip casting.

Properties: High density (230 lbs/cu ft) helps resist the wetting and penetration of molten glass. Resistant also to thermal spalling, fluxing conditions; has constancy of volume under soaking heat in excess of 2900°F .

Uses: To pave glass tank bottoms and floors; line sodium metaphosphate and sodium silicate furnaces; tap hole blocks for aluminum and nonferrous melting; nozzles for continuous steel casting.

zirconia. See zirconium oxide.

zirconic anhydride. See zirconium oxide.

"Zirconite."³³⁷ Trademark for foundry materials containing 97–98% zircon minimum. M.p. $4050\text{--}4100^\circ\text{F}$. Available as sand and flour. Used in foundries for

cores, molds, and facings; reduces cleaning costs and produces smoother castings.

zirconium Zr Metallic element of atomic number 40, group IVB of the periodic table. Atomic weight 91.22; valences 2,3 (halogens only), 4. There are 5 stable isotopes.

Properties: Hard, lustrous, grayish, crystalline scales or gray amorphous powder; sp. gr. 6.4; m.p. about 1850°C ; b.p. 4377°C ; soluble in hot, very concentrated acids; insoluble in water and cold acids. Corrosion-resistant; low neutron absorption. Low toxicity.

Sources: Zircon; baddeleyite (zirconia).

Derivation: The ore is converted to a cyanonitride, which is chlorinated to obtain zirconium tetrachloride.

This is reduced with magnesium (Kroll process) in inert atmosphere. The metal can be prepared in a highly pure and ductile form by vapor-phase decomposition of the tetraiodide. Hafnium must be removed for uses in nuclear reactors (see hafnium).

Grades: Plate, strip, bars, wire; sponge and briquettes; powder; foil; technical; pure (hafnium-free); single crystals.

Hazard: Flammable and explosive as dust or powder, and in form of borings, shavings, etc. Tolerance (as Zr): 5 mg per cubic meter of air (applies to all Zr compounds). Powder should be kept wet in storage, and protective clothing should be worn. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Nuclear technology; corrosion-resistant alloys; photoflash bulbs (foil); pyrotechnics; metal-to-glass seals; special welding fluxes; getter in vacuum tubes; explosive primers; acid manufacturing plants; deoxidizer and scavenger in steel manufacture.

Shipping regulations: Many particulate forms require Yellow label (Rail) and are Not acceptable by air. Consult regulations for details.

Note: Use of zirconium compounds in aerosol sprays as an antiperspirant has been restricted by FDA due to suspected toxicity.

zirconium 95. Radioactive zirconium of mass number 95.

Properties: Half-life, 63 days; radiation, beta and gamma.

Derivation: Obtained in a mixture with niobium from the fission products of nuclear reactor fuels.

Forms available: Zirconium oxalate complex in oxalic acid solution.

Hazard: Radioactive poison.

Uses: To trace the flow of petroleum products in pipelines; to measure the rate of catalyst circulation in petroleum cracking plants; to study the cracking and polymerization of hydrocarbons with various catalysts; etc.

Shipping regulations: Consult regulations.

zirconium acetate $\text{H}_2\text{ZrO}_2(\text{C}_2\text{H}_3\text{O}_2)_2$

Properties: (a) Available as aqueous solution, 22% ZrO_2 . Clear to pale amber liquid; sp. gr. 1.46 (approx); pH 3.8–4.2 (20°C); f.p. -7°C ; stable at room temperature. (b) Available as 13% ZrO_2 (aqueous solution); sp. gr. 1.20 (approx); pH 3.3–4.0 (20°C); stable at room temperature, but temperature of hydrolysis decreases with pH; undergoes exchange with anion exchange resins, but not with cation exchangers.

Containers: Polyethylene-lined drums; carloads.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air. Uses: Preparation of water repellents, pharmaceuticals, other chemicals.

zirconium acetylacetonate. See zirconium tetraacetylacetonate.

zirconium ammonium fluoride (ammonium zirconifluoride) $Zr(NH_4)_2F_6$.

Properties: White crystals. Soluble in water.

Hazard: Toxic and irritant. Tolerance (as Zr), 5 mg per cubic meter of air.

zirconium anhydride. See zirconium oxide.

zirconium boride (zirconium diboride) ZrB_2 .

Properties: Gray metallic crystals or powders; sp. gr. 6.085; m.p. 3000°C; Mohs hardness 8; electrical resistivity 9.2 micro-ohm-cm at 20°C; excellent thermal shock resistance; poor oxidation resistance above 1100°C.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air.

Uses: Refractory for aircraft and rocket applications; thermocouple protection tubes; high temperature electrical conductor; cutting tool component; coating tantalum; cathode in high-temperature electrochemical systems.

zirconium carbide ZrC .

Properties: Gray crystalline solid; sp. gr. 6.78; hardness Mohs 8+; m.p. 3400°C; b.p. 5100°C; insoluble in water and hydrochloric acid; soluble in oxidizing acids and attacked by oxidizers.

Derivation: By heating zirconium oxide and coke in an electric furnace.

Grade: Technical.

Containers: Iron drums.

Hazard: Powder or dust will ignite spontaneously.

Tolerance (as Zr), 5 mg per cubic meter of air.

Uses: Incandescent filaments; abrasive; cermet component; high temperature electrical conductor; refractory; metal cladding; cutting tool component.

zirconium carbonate, basic (zirconyl carbonate; zirconium carbonate) $ZrOCO_3$ or $ZrOCO_3 \cdot xH_2O$.

Properties: White, amorphous powder. Soluble in acids; insoluble in water.

Derivation: By adding sodium carbonate to a solution of zirconium salt.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air.

Use: Preparation of zirconium oxide.

zirconium chloride. See zirconium tetrachloride.

zirconium chloride, basic. See zirconium oxychloride.

zirconium diboride. See zirconium boride.

zirconium dioxide. See zirconium oxide.

zirconium disilicide (zirconium silicide) $ZrSi_2$. Gray solid; sp. gr. 4.88 (22°C); soluble in hydrofluoric acid; insoluble in water and aqua regia.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air.

Uses: Coatings resistant to flame or blast impingement; special alloys.

zirconium disulfide ZrS_2 . Gray crystalline solid; sp. gr. 3.87; m.p. ca. 1550°C; insoluble in water. Used as a solid lubricant.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air.

zirconium fluoride. See zirconium tetrafluoride.

zirconium glycolate $H_2ZrO(C_2H_2O_3)_3$.

Properties: Solid; decomposes without melting on heating to about 220°C; insoluble in water and organic solvents; soluble in alkali and sulfuric acid solutions. One or more of the acidic hydrogens may be replaced by alkali metals or ammonium to give water-soluble salts.

Containers: 250-lb (polyethylene-lined) fiber drums (41 gals).

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air. Uses: Cosmetics (deodorant); medicine; sequestrant.

zirconium hydride ZrH_2 . Contains 1.7 to 2.1% combined hydrogen which can driven off in a vacuum above 600°C.

Properties: Gray-black metallic powder. Stable toward air and water. Sp. gr. 5.6. Autoignition temp. 518°F.

Derivation: Reduction of zirconia with calcium hydride or magnesium in the presence of hydrogen; direct combination of hydrogen and zirconium.

Grades: Commercial (contains hafnium); reactor (hafnium-free); electronic.

Hazard: Flammable, dangerous fire risk, especially in presence of oxidizing agents. Tolerance (as Zr), 5 mg per cubic meter of air.

Uses: Vacuum-tube getter; powder metallurgy; source of hydrogen; metal-foaming agent; nuclear moderator; reducing agent; hydrogenation catalyst.

Shipping regulations: (Air) Flammable Solid label. Not acceptable on passenger planes.

zirconium hydroxide $Zr(OH)_4$.

Properties: White, bulky, amorphous powder. Soluble in dilute mineral acids; insoluble in water and alkalis. Sp. gr. 3.25; decomposes to ZrO_2 at 550°C.

Derivation: Action of a solution of sodium hydroxide on a solution of a zirconium salt.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air.

Use: Zirconium compounds; pigments; dyes; glass.

zirconium hydroxychloride solution. See zirconyl hydroxychloride solution.

zirconium lactate $H_4ZrO(CH_3CHOCO_2)_3$.

Properties: White, slightly moist pulp; decomposes without melting; very slightly soluble in water and the common organic solvents; soluble in aqueous alkalis with formation of salts; decomposes to hydrous zirconia above pH 10.5. Efficient odor absorber. Combustible.

Grade: Zirconia 25% (min).

Containers: 250-lb (polyethylene-lined) fiber drums.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air.

Uses: Body deodorants; source of zirconia.

zirconium naphthenate.

Properties: Amber-colored, heavy transparent liquid. Viscosity equivalent to that of heavy lubricating oil.

Very stable. Unlike other metallic naphthenates, possesses no drying properties. Soluble in all common solvents. Sp. gr. 1.05. Combustible.

Derivation: By heating a mixture of naphthenic acid and zirconium sulfate.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air.

Uses: Ceramics (enamels, glazes); lubricants; paints and varnishes (anti-chalking agent, minimizer of moisture and solar radiation effects).

zirconium nitrate $Zr(NO_3)_4 \cdot 5H_2O$.

Properties: White hygroscopic crystals. Soluble in water and alcohol. Decomposes at 100°C.

Derivation: Action of nitric acid on zirconium oxide.

Containers: Kegs, drums.

Hazard: Dangerous fire and explosion risk in contact with organic materials; strong oxidizing agent. Tolerance, 5 mg per cubic meter of air.

Use: Preservative.

Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Oxidizer label.

zirconium nitride ZrN . A brassy-colored powder produced by heating the metal in nitrogen.

Properties: Sp. gr. 7.09; hardness Mohs 8+; m.p. 2930°C; slightly soluble in dilute hydrochloric or

sulfuric acid; soluble in concentrated acids.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air.

Uses: Special crucibles; cermets; refractories.

zirconium orthophosphate. See zirconium phosphate.

zirconium oxide (zirconia; zirconium dioxide; zirconic anhydride; zirconium anhydride) ZrO_2 . Occurs in nature as baddeleyite.

Properties: Heavy white amorphous powder; sp. gr. 5.73; m.p. 2700°C ; Mohs hardness 6.5; refractive index 2.2; insoluble in water and most acids or alkalis at room temperature; soluble in nitric acid and hot concentrated hydrochloric, hydrofluoric, and sulfuric acids. Most heat-resistant of commercial refractories; dielectric.

Derivation: By heating zirconium hydroxide or zirconium carbonate.

Grades: Reagent; technical; crystals; fused; whiskers; C.P. (99% zirconia); hydrous. The fused grade is reported to be harder than diamond (11 on Mohs scale).

Containers: Bags; drums; carloads.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air.

Uses: (Unstabilized) Production of piezoelectric crystals; high-frequency induction coils; colored ceramic glazes; special glasses; source of zirconium metal; heat-resistant fibers; (Hydrous) odor absorbent; to cure dermatitis caused by poison ivy. (Stabilized with CaO) Refractory furnace linings, crucibles, etc.; solid electrolyte for batteries operating at 1000°C or more.

"Zirconium Oxide, E.F."³³⁷ Trademark designation for zirconium oxide available in lump or milled form. Lump contains 97–98% zirconium oxide and milled, 94.9%. Melting point, 4900°F . Used in massive packing of high temperature installations and refractory uses up to 4000°F not requiring stabilized zirconia.

zirconium oxychloride (zirconium chloride, basic; zirconyl chloride) $\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$.

Properties: White, silky crystals; loses $6\text{H}_2\text{O}$ at 150°C , $8\text{H}_2\text{O}$ at 210°C ; density 44 lb/cu ft. Soluble in water, methanol, and ethanol; insoluble in other organic solvents. Aqueous solutions are acidic.

Derivation: Action of hydrochloric acid on zirconium oxide.

Grades: Technical; 36% ZrO_2 ; H.P.

Containers: Barrels; 250-lb (plastic-lined) fiber drums; carloads.

Uses: Textile, cosmetic, and grease additive; antiperspirant; water repellents; chemical reagent; zirconium salts; in lakes and toners of acid and basic dyes; oil-field acidizing aid.

zirconium phosphate (zirconium phosphate, basic; zirconium orthophosphate) $\text{ZrO}(\text{H}_2\text{PO}_4)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White, dense, amorphous powder. Decomposes on heating. Soluble in acids; insoluble in water and organic solvents. Extensively hydrolyzed in basic solution.

Derivation: Action of phosphoric acid on zirconium hydroxide.

Containers: Glass bottles; fiber drums; carloads.

Hazard: Tolerance (as Zr), 5 mg per cubic meter of air.

Uses: Chemical reagent; cation scavenger; coagulant; carrier for radioactive phosphorus.

zirconium potassium chloride (potassium zirconium chloride) $\text{ZrCl}_4 \cdot \text{KCl}$. A source of zirconium for

magnesium alloys; to remove iron in an insoluble form.

zirconium potassium fluoride ZrK_2F_6 . (potassium fluorozirconate, potassium zirconifluoride).

Properties: White crystals. Soluble in water (hot).

Hazard: Toxic and irritant. Tolerance (as F), 2.5 mg per cubic meter in air.

Uses: Grain refiner in magnesium and aluminum; welding fluxes; catalyst; optical glass.

zirconium potassium sulfate (potassium zirconium sulfate) $2\text{K}_2\text{SO}_4 \cdot \text{Zr}(\text{SO}_4)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder. Slightly soluble in water.

Hazard: Tolerance, 5 mg per cubic meter in air.

zirconium pyrophosphate ZrP_2O_7 .

Properties: White solid; stable to about 1550°C ; insoluble in water and dilute acids other than hydrofluoric acid; coefficient of thermal expansion 5×10^{-6} (approx) at 1000°C .

Containers: 250-lb fiber drums; carloads.

Hazard: Tolerance (as Zr), 5 mg per cubic meter in air.

Uses: Refractory; olefin polymerization catalyst; phosphor.

zirconium silicate. See zircon.

zirconium silicide. See zirconium disilicide.

"Zirconium Spinel."³³⁷ Trade designation for a synthetic complex containing 39–41% zirconium oxide, 20–22% silicon dioxide, 18.5–20.5% aluminum oxide, and 17–21% zinc oxide. M.p. 3100°F . Used as a glaze opacifier in the ceramic industry.

zirconium sulfate $\text{Zr}(\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$.

Properties: White, crystalline powder; bulk density 70 lb/cu ft; decomposes to monohydrate at about 100°C . Soluble in water; slightly soluble in alcohol; insoluble in hydrocarbons. Aqueous solutions are strongly acidic; will precipitate potassium ions and amino acids from solution; are decomposed by bases and heat.

Derivation: Action of sulfuric acid on zirconium hydroxide.

Containers: Glass bottles; steel drums.

Hazard: Tolerance (as Zr), 5 mg per cubic meter in air.

Uses: Chemical reagent; lubricants; catalyst; protein precipitation; tanning of white leather.

zirconium sulfate, basic (zirconyl sulfate) $\text{Zr}_5\text{O}_8(\text{SO}_4)_2 \cdot x\text{H}_2\text{O}$ (approximately). Similar in properties to the oxychloride, and is prepared in a similar fashion, the end result being in cake form. Used in textile treatment and white leather tanning and retannage.

zirconium tetraacetylacetonate (zirconium acetylacetonate) $\text{Zn}[\text{OC}(\text{CH}_3)_2\text{:CHCO}(\text{CH}_3)]_4$.

Properties: A colorless, crystalline tetrachelate; sp. gr. 1.415; m.p. $194\text{--}5^\circ\text{C}$ (decomposition) begins at 125°C . Soluble in pyridine, acetone, benzene, and other organic solvents having some polarity; slightly soluble in water.

Derivation: Reaction between zirconyl chloride, acetylacetone and sodium carbonate.

Hazard: Tolerance (as Zr), 5 mg per cubic meter in air.

Uses: Crosslinking agent for polyol, polyester, and polyalkoxy resins; lubricant and grease additive; reagent; catalyst.

zirconium tetrachloride (zirconium chloride) ZrCl_4 .

Properties: White, lustrous crystals. Soluble in alco-

hol; decomposes in water. Sp. gr. 2.8; sublimes above 300°C.

Derivation: Action of hydrochloric acid on zirconium hydroxide.

Grade: Technical.

Containers: Glass bottles; drums.

Hazard: Toxic and irritant. Tolerance (as Zr), 5 mg per cubic meter in air.

Uses: Source of the pure metal (formed as intermediate in process); analytical chemistry; water repellents for textiles; tanning agent; catalysis; zirconium compounds.

Shipping regulations: (Air) Corrosive label.

zirconium tetrafluoride (zirconium fluoride) ZrF_4 .

Properties: White powder; sp. gr. 4.43; m.p. ca. 600°C (sublimes). Slightly soluble in water and hydrogen fluoride.

Hazard: Toxic; strong irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Component of molten salts for nuclear reactors.

Zircon Milled "G."³³⁷ Trademark for a form of zirconium silicate of 97% minimum purity. Used in electrical and chemical porcelains and refractories.

zirconocene dichloride (dicyclopentadienylzirconium dichloride) $(C_5H_5)_2ZrCl_2$.

Properties: White crystals; m.p. 244°C; soluble in polar organic solvents; stable in dry air, very slowly hydrolyzes in moist air.

Containers: Bottles and fiber drums.

Hazard: Toxic by inhalation and skin contact; irritant to eyes and mucous membranes.

Uses: Rubber accelerator; component of a catalyst system for polymerization of vinyl monomers; curing agent for water-repellent silicone materials; agent for plating with zirconium.

See also metallocene.

zircon, porcelain. See porcelain, zircon.

zircon sand. A sand containing considerable zirconium, titanium and related metals. Used as a source of these elements, and also as a heat-resistant sand for casting of alloys.

zirconyl carbonate. See zirconium carbonate, basic.

zirconyl chloride. See zirconium oxychloride.

zirconyl hydroxychloride $ZrOOHCl \cdot nH_2O$.

Properties: Colorless or slightly amber liquid (aqueous solution); sp. gr. 1.26; forms a soluble glass on evaporation; pH of solution 0.8 (approx); reacts with alkalis to form hydrous zirconia. Contains 20% zirconia.

Containers: 500-lb (plastic-lined) steel drums; carloads.

Uses: Pharmaceuticals; deodorants; precipitation of acid dyes; zirconium compounds; water repellents for textiles.

zirconyl nitrate (basic) (zirconyl hydroxynitrate) $ZrO(OH)NO_3$.

Properties: Aqueous solution; Sp. gr. (25°C) 1.35.

Hazard: Fire risk in contact with organic materials.

Uses: Gelatins and improving lamination bonds of polyvinyl alcohol.

zirconyl sulfate. See zirconium sulfate, basic.

"Zircopax."³³⁷ Trademark for zirconium silicate, 94–96.5% min. purity. Used as an opacifier for ceramic glazes.

"Zircotan."²³ Trademark for zirconium tanning agents which produce through-white leather.

Uses: Tannage of white kid suede, glove leathers; retannage of chrome leather.

"Zirex."⁷⁹ Trademark for a special zinc resinate having a high melting point; high zinc content (twice as high as "Zitro") with a pale color and a negative acid number (slightly basic).

Uses: Paints; varnishes; adhesives; ethyl cellulose lacquers.

"Zirmul."⁴⁰⁸ Trademark for a bonded alumina-zirconia-silica refractory containing a minimum of glassy phase. It has broad applications in construction of glass melting furnaces, both above and below the glass line.

"Zirox" B.³³⁷ Trademark for a polishing compound of zirconium oxide. Used for ophthalmic lenses, precision glass, marble, and granite.

"Zitro."⁷⁹ Trademark for a zinc resinate having a high melting point, pale color and low acid number. Uses: Paints; varnishes; adhesives; ethyl cellulose lacquers.

ZMA. Abbreviation for zinc metaarsenite. See zinc arsenite.

Zn Symbol for zinc.

zoalene. Generic name for 3,5-dinitro-ortho-toluamide $(O_2N)_2C_6H_2(CH_3)CONH_2$.

Properties: Yellowish solid; m.p. 177°C. Very slightly soluble in water; soluble in acetone, acetonitrile, dioxane, and dimethylformamide.

Use: Coccidiostat; permissible food additive.

"Zoamix."²³³ Trademark for poultry coccidiostats containing 3,5-dinitro-o-toluamide.

"Zobar."²⁸ Trademark for a weed killer based on an aqueous solution of the dimethylamine salts of polychlorobenzoic acids, containing 4 lb of acid equivalent per gallon.

"Zolex."⁴⁵⁷ Trademark for an aromatic solvent, proposed as an alternate for xylene. Distillation range (ASTM) 270–325°F.

"Zonarez."²⁵² Trademark for a series of polyterpene resins. Thermoplastic polymers produced by the polymerization of terpene hydrocarbons consisting primarily of beta-pinene and dipentene. Available in two series of products—Zonarez B and Zonarez 7000. The B series is produced by the polymerization of beta-pinene, while the 7000 series is based primarily on dipentene. Products of comparable softening points in the two series are differentiated mainly by molecular weight, molecular weight distribution and polymer structure. These resins are bright, clear and pale-colored, low molecular weight polymers which impart high levels of tack and adhesion to many elastomeric and polymeric materials. They have excellent stability in adhesive systems whereby variations in color, viscosity, holding power and tack are minimized. They are neutral in nature, have good resistance to attack by acids, alkalis, salts and water, and exhibit excellent compatibility with numerous organic solvents including aliphatic and aromatic hydrocarbons, chlorinated hydrocarbons, rubbers and elastomers, drying oils, polyethylenes, ethylene copolymers, waxes, esters, terpenes, rosin and rosin derivatives.

Uses: Manufacture of pressure-sensitive adhesives for tapes and labels, rubber cements, solvent-based adhesives, emulsion adhesives, hot-melt adhesives and coatings, can sealants, caulking and general

sealant compounds, inks, investment casting waxes, paints, concrete waterproofing agents, varnishes, chewing and bubble gum bases, moisture resistant soft gelatin capsules and powders of ascorbic acid and its salts, and other applications which require low molecular weight linear polymers that promote tack and adhesion and have excellent aging properties.

zone refining. A purification process that involves repeated melting and crystallization. The sample to be purified is placed in a relatively long narrow tube and then passed slowly through a furnace having short, alternate hot and cold zones. Melting occurs opposite the hot zones and crystallization opposite the cold zones. As the rod moves through the furnace the zones move along the rod. Impurities remain in the molten zones and so are carried to one end of the rod. The process has been most used for relatively high cost materials used in small quantities at very high purities, as for solid state electronic purposes.

"Zonolite."²⁴¹ Trademark for verxite (expanded hydrobiotite) (q.v.).

"Zonyl."²⁸ Trademark for a series of surface-active agents and lubricants.

A. Modified polyethylene glycol type nonionic.

E-7. A fluoroalkyl ester, the condensation product of pyromellitic anhydride and a mixture of C-5 and C-7 trihydrofluoroalcohols.

E-91. A fluoroalcohol camphorate.

S-13. The free acid of a fluoroalkyl phosphate.

"Zopaque."²⁹⁶ Trademark for pure titanium dioxide (q.v.), manufactured from ilmenite and specially processed to control crystal growth.

Uses: White pigment in rubber, plastics, paints, etc.

"Zoron" WSP.²⁸ Trademark for a resin finish used to insolubilize starch, polyvinyl alcohol and other pigments. Used by paper industry to impart a water resistant finish.

zoxazolamine (2-amino-5-chlorobenzoxazole)

$C_7H_5ClN_2O$.

Properties: White to creamy white, odorless powder or glistening crystals; freely soluble in alcohol; nearly insoluble in water; m.p. 183–188°C.

Use: Medicine.

Zsigmondy, Richard (1865–1929). A native of Austria, Zsigmondy received the Nobel Prize in chemistry in 1925 for his work in the field of colloid chemistry, which was initiated by his interest in ruby glass (a colloidal gold suspension). His most important contribution to chemistry was his invention of the ultramicroscope (with Siedentopf) in 1903. By illuminating the sample with a light beam at right angles to the incident light in a compound microscope, the presence of particles in a suspension as small as 3 millimicrons could be detected due to the light-scattering effect of the particles. This phenomenon had been discovered by John Tyndall a few years earlier, but Zsigmondy was the first to apply it to microscopy. The ultramicroscope became of immeasurable value in the study of colloidal suspensions.

Zr Symbol for zirconium.

zwitterion. See isoelectric point.

zymase. The enzyme present in yeast which converts sugars to alcohol and carbon dioxide.

zymohexase. See aldolase.

"Zymol."²²¹ Trademark for a chemically modified linseed oil for part or complete replacement for tung oil in varnish manufacturing.

"Zyrol."⁴⁸⁷ Trademark for a concentrated amine condensate surfactant particularly useful for woolens.

"Zyfel."²⁸ Trademark for a nylon resin available as molding powder, extrusion powder and soluble resin.

"Zytron."²³³ Trademark for O-[2,4-dichlorophenyl]-O-methyl isopropylphosphoramidothioate (q.v.).
Hazard: May be toxic.

APPENDIX I

Manufacturers of Trade marked Products Numerical List

(for addresses, see Alphabetical List, page 952)

1. Stauffer Chemical Co.
3. Abbott Laboratories
4. Rhode Island Laboratories, Inc.
5. Firestone Tire and Rubber Co.
7. Sanforized Co.
8. Scientific Chemicals, Inc.
9. Knoll Pharmaceutical Co.
10. Van Dyk & Co., Inc.
11. Koppers Co., Inc.
12. Sindar Corporation
13. Formica Corporation
15. Armour Industrial Chemical Co.
- 15a. Reheis Chemical Co.
16. Thomas, Arthur H. Co.
17. Heresite & Chemical Co.
19. Inmont Corp.
- 19a. Interpace Corp.
20. Corning Glass Works
21. Neville Chemical Co.
22. Staley Chemical Co.
23. Rohm & Haas Co.
24. Wyeth Laboratories
25. Pennsylvania Refining Co.
27. Thiokol Chemical Corporation
28. Du Pont de Nemours, E. I. & Co.
29. Enjay Chemical Co.
30. Corn Products Co.
31. Handy & Harman
35. Firestone Plastics Co.
36. Reichhold Chemicals, Inc.
38. Sierra Talc & Chemical Corporation
40. V-C Chemical Co.
41. Atlas Minerals and Chemicals Division, Electric Storage Battery Co.
42. Sun Chemical Corporation
45. See 104
46. Acheson Colloids Co.
47. Durrion Company, Inc.
48. Cleary, W. A. Corporation
50. Allied Chemical Corp.; (all divisions).
51. Humble Oil & Refining Co.
52. Rubber Corporation of America
53. National Starch and Chemical Corporation
54. Carrier Corporation
55. FMC Corporation
56. Canadian Industries Ltd.
57. American Cyanamid Co.
58. Monsanto Industrial Chemicals Co.
60. Cerro Sales Corporation
62. Hooker Chemical Corporation
63. Richardson Co., The
64. Spencer Kellogg Division, Textron, Inc.
65. Borden Chemical
67. Climax Molybdenum Co.
69. Vanderbilt Co., R. T., Inc.
70. Searle Chemicals, Inc.
71. Smith Kline & French Laboratories
73. Glyco Chemicals, Inc.
74. Tenneco Chemicals, Inc., Intermediates Division
79. Tenneco Chemicals, Inc., Newport Division
81. Ventron Corp.
82. Graphite Metallizing Corp.
84. Olin Corp.
85. Shulton Inc.
88. American Potash & Chemical Corp.
89. ICI United States, Inc.
91. Schwarz/Mann
92. Masonite Corp.
93. Tennessee Corp.
94. Hall, C. P., Co.
97. Chesebrough-Pond's, Inc.
98. Floridin Co.
99. Minerals & Chemicals Div., Engelhard Minerals & Chemicals Corp.
100. Lilly, Eli, and Co.
103. Hoyt, Arthur S., Co., Inc.
104. Witco Chemical Co, Inc.
106. American Mineral Spirits Co.
107. American Norit Co., Inc.
108. See 323.
109. Arapahoe Chemicals, Inc.
110. United Carbon Co.
114. Premier Malt Products, Inc.
115. Eastman Kodak Co.
116. Allis-Chalmers Corp.
117. Alox Corp.
118. California Industrial Minerals Co.
119. Goodrich, B. F., Chemical Co.
121. American Can Co.
122. G & A Laboratories, Inc.
123. Merck & Co., Inc.
124. Marine Colloids, Inc.
125. Shell Chemical Co.
126. Pacific Lumber Co.
128. Petrolite Corp., Bareco Division
129. Weyerhaeuser Co.
133. Columbian Carbon Co., Inc.
134. Harshaw Chemical Co.
136. Atlantic Refining Co.
137. Jefferson Chemical Co., Inc.
138. Tenneco Chemicals, Inc., Heyden Div.
139. Moores Lime Co.
140. Pennsylvania Industrial Chemical Corp.
141. Sherwin-Williams Chemicals

142. Enthone Inc.
144. Airco Chemicals and Plastics
145. Lithcote Corp.
147. Chipman Chemical Co.
148. National Lead Co., DeLore Division
149. Dow Corning Corp.
151. Chevron Chemical, Co.
152. Swift Edible Oil Co.
154. Wallace & Tiernan, Inc., Lucidol Division
155. Driver, Wilbur B., Co.
157. Nulomoline Division, SuCrest Corp.
158. 3M Company
159. Royce Chemical Co.
160. Simplex Wire & Cable Co.
161. Hitco
162. Winthrop Laboratories, Sterling Drug Co.
164. Rumford Chemical Works
165. Apex Chemical Co., Inc.
166. Hoskins Mfg. Co.
167. Kendall Refining Co.
168. Lake States Chemical Div., St. Regis Paper Co.
169. LaMotte Chemical Products Co.
170. Paisley Products
173. Wallerstein Co.
175. See 50.
177. PPG Industries, Inc.
179. General Tire & Rubber Co.
181. Chemagro Agricultural Div., Mobay Chemical Corp.
182. Nalco Chemical Co.
183. Natural Gas Odorizing, Inc.
184. Permutit Co.
188. Fritzsche Dodge & Olcutt, Inc.
189. Wallace & Tiernan, Inc., Harchem Div.
190. Hoffmann-LaRoche, Inc.
191. Owens-Corning Fiberglas Corp.
192. U. S. Industrial Chemicals Co.
196. American Agricultural Chemical Co.
197. See 50.
200. Apco Oil Corp.
201. Philadelphia Quartz Co.
202. Baker Castor Oil Co.
203. BASF-Wyandotte Corp.
204. Pennsalt Chemicals Corp.
205. Grace & Co., W. R. Construction Products Div.
206. See 89.
- 206a. Chemical Mfg. Co., Inc.
210. Ionac Chemical Co.
212. Miles Laboratories, Inc.
214. Union Carbide Corp.
216. Amoco Chemicals Corp.
217. Filtrol Corp.
218. General Refractories Co.
219. Ciba-Geigy Corp.
220. Thermal American Fused Quartz Co.
221. Archer Daniels Midland Co.
222. Arco Chemical Co.
223. Osborn, C. J., Chemicals, Inc.
224. Quaker Oats Co.
225. Bromine Producers Div., Drug Research, Inc.
226. Aluminum Co. of America
227. Givaudan Corp.
228. West Virginia Pulp & Paper Co.
230. Carlisle Chemical Works, Inc., Advance Division
231. Brown Co.
232. Holliday, L. B., & Co., Ltd.
233. Dow Chemical Co.
235. National Rosin Oil Products, Inc.
236. National Lead Co., Baroid Div.
238. Chemical Development Corp.
239. Clay-Adams, Inc.
241. Grace, W. R., & Co., Davison Chemical Division
242. Emery Industries, Inc.
243. See 50.
244. Diamond Alkali Co.
245. General Electric Co., Polymers Product Dept.
247. Johns-Manville Products Corp.
248. Uniroyal Chemical
249. Norton Co., Metals Division
250. Foote Mineral Co.
251. Republic Steel Corp.
252. Arizona Chemical Co.
253. See 151.
256. Eastman Chemical Products, Inc.
259. General Mills Chemicals, Inc.
261. FMC Corp., Avicel Dept.
263. Scott Bader & Co., Ltd.
265. Goodyear Tire & Rubber Co.
266. Hercules, Inc.
267. Kenrich Petrochemicals, Inc.
268. New Jersey Zinc
269. Worthington Corp.
270. Mearl Corp.
271. American Lignite Products Co.
272. Ames Laboratories, Inc.
274. Beckman Instruments, Inc.
275. Cabot Corp.
277. Xylos Rubber Co.
278. Firestone Synthetic Rubber and Latex Co.
280. See 442.
281. Budd Co.
282. See 154, 189.
283. Huntington Alloy Products Div., International Nickel Co., Inc.
284. West Chemical Products, Inc.
285. Huber, J. M., Corp.
287. Beaunit Corp.
288. M & T Chemicals, Inc.
289. Lockrey Co.
292. See 50.
293. Inmont Corp.
296. Glidden-Durkee Div., SCM Corp.
299. Pfizer, Inc., Chemicals Division
300. Arkansas Co., Inc.
301. Burroughs Wellcome & Co., Inc.
303. Phillips Petroleum Co.
304. National Lead Co.
305. Ciba Pharmaceutical Co.
307. GAF Corp.
308. Westinghouse Electric Corp.
309. Nopco Division, Diamond Shamrock Chemical Co.
310. Norac Co., Inc.
311. Grace, W. R., & Co., Organic Chemicals Div.
312. Evans Chemetics, Inc.
- 312a. Fabric Research Laboratories
313. Ethyl Corp.
315. American Cyanamid Co., Fine Chemicals Dept.
316. Velsicol Chemical Corp.
319. Commercial Solvents Corp.
320. Houghton, E. F., & Co.
321. Schering Corp.
322. Kelco Co.
323. Calgon Corp., Pittsburgh Activated Carbon Division
324. Anaconda American Brass Co.
325. I.C.I. Organics, Inc.
326. U. S. Stoneware Co.
327. Upjohn Co.
328. Onyx Chemical Co.
329. Mallinckrodt, Inc.
330. Parke, Davis & Co.
331. Mobil Chemical Co.
332. National Filter Media Corp.
336. See 304.

- 337. See 304.
